# Meeting ID: 30

Data Source: Train

## Executive Summary

The project manager opens the meeting by stating that they will address functional design and then going over the agenda. The industrial designer gives his presentation, explaining how remote controls function and giving personal preference to a clear, simple design that upgrades the technology as well as incorporates the latest features in chip design. The interface specialist gives her presentation next, addressing the main purpose of a remote control. She pinpoints the main functions of on/off, channel-switching, numbers for choosing particular channels, and volume; and also suggests adding a menu button to change settings such as brightness on the screen. She gives preference to a remote that is small, easy to use, and follows some conventions. The group briefly discusses the possibility of using an LCD screen if cost allows it, since it is fancy and fashionable. The marketing expert presents, giving statistical information from a survey of 100 subjects. She prefers a remote that is sleek, stylish, sophisticated, cool, beautiful, functional, solar-powered, has long battery life, and has a locator. They discuss the target group, deciding it should be 15-35 year olds. After they talk about features they might include, the project manager closes the meeting by allocating tasks.

## Complete Meeting Transcript

Cool. Do you wanna give me the little cable thing? Yeah. Cool. Ah, that's why it won't meet. Okay, cool. Yep, cool. Okay, functional requirements. Alright, yeah. It's working. Cool, okay. So what I have, where I've got my information from is a survey where the usability lab um observed remote control use with um a hundred subjects and then they gave them a questionnaire. Um so it was all about, you know, how people feel about the look and feel of the remote control, you know. What's the most annoying things about remote controls and um the possibility of speech recognition and L\_C\_D\_ screens in remote control. Not that they actually gave me any answers on the L\_C\_D\_ screens, so I should have taken that bit out, but anyway. Um okay, so. What they found is that people don't like how current remote controls are, so you know, definitely you should be looking at something quite different. Um seventy five percent of users find most remote controls ugly. Uh the other twenty five percent have no fashion sense. Uh eighty percent of users would spend more to get um you know, a nice looking

remote control. Um current remote controls, they don't match the user behaviour well, as you'll see on the next slide. Um I dunno what zapping is, but Oh, right. But you have that little thing that comes up at the bottom and tells you what's on. Um okay, fifty percent of users say they only use ten percent of the buttons, so that's going back to what, you know, we were saying earlier about, you know, do you need all the buttons on the remote control, they just make it look ugly. Okay? Cool. Um so this is my little graph thing. Mm k Okay, well, I can send it to all of you. What it is is um it's cones, 'cause I thought they'd be more exciting. Um but ooh where's it go? Back. Oh. Oh yes, cool. Okay, I'm gonna stop playing with the little pointy thing. Um okay, so like what it shows is how much things are used relatively and what you can clearly see from that is the thing that's used most is the channel selection. What you can't see is volume selection, it's a little bit higher than all the others. Yeah, so what the graph shows is that, you know, power, channel selection and volume selection are important, and the rest of them, you know, nobody really uses and so that's the the numbers along the top represent their like um their importance, you know, so on a scale of one to ten, how important is that and, you know, channel selection and volume selection are absolutely essential, and the power, well it's not quite so essential, apparently, although I don't understand how it couldn't be, um and everything else, I think, you know, you can forget about having those buttons on the remote control, 'cause they're just not needed, and they're not used. Okay. This is the bit that the email messed up for me and that's what I was fiddling about with at the beginning of the thing. Okay, cool. So um okay, so this is what people find annoying about remote controls. Uh that they get lost, that the uh you know, they're not intuitive and that they're bad for repetitive strain injury. I think if you're watching enough T\_V\_ to get repetitive strain injury from um you know, watching T\_V\_, then that's the least of your problems, but you know, it's up there. Um that yeah. Okay, so um I mean the the R\_S\_I\_ thing would be that, like when you have the computer keyboards and you keep your wrists up would be something that encourages you want something with an ergonomic t design that encourages good use of the remote control and you know, not straining your wrists watching T\_V\_. Yes. Okay, cool. Right, um sorry this is pink because I was copying and pasting the table, and I didn't have time to white it out again. Um okay, but that shows how people whether they would pay more for voice recognition software. So you can see from that that, you know, younger people to the age of thirty five are quite likely to pay quite a lot more f well quite are quite likely to pay more for voice

recognition software, whereas as people get older, they're a bit more sceptical about it and they're less willing to to try it. Um so clearly voice recognition is something to think about, but um you know I d I do wonder how well that would work given that a T\_V\_, you know, tends to be people talking and um, you know, how are you going to stop it from just flipping channels whilst watching T\_V\_. Um okay? Cool. Um okay, so these are my personal preferences. So you have sleek, stylish, sophisticated, you know, so something that's, you know, a bit cool. Um you know, functional, so it's useful, but minimalist. Um there's a there's an important thing that, you know, people use when, you know, when you're filling up your home, you know, a lot of people fill up their home with bits of crap, basically, you know, and you've got all this stuff, and you're just like, what the hell is that, who is ever gonna use it? You know, so things should either be functional or beautiful or preferably both, so I think we need to aim for both. Um okay, then a long battery life, like you were talking about earlier and um, you know, I was thinking that solar power would be quite cool because, you know, your remote control just sits there, and you could just sit it in the sunshine and save the environment a bit. Um and then like a locator, so you know, kind of like you have for a mobile phone or not a mobile phone Yeah, that's it, you know. I know, it's weird. My flatmate and I were talking about this on the way into uni this morning and I was like I need to get one

for everything. So yeah, so maybe something where you clap and then it beeps, something a kind of sound that you don't often hear on the T\_V\_, you know, 'cause you don't want your remote control beeping every five minutes, 'cause you you'd then deliberately lose it by throwing it out the window or something. So okay? Cool. That's me. Cat's. Ca. Yeah, I mean that's the thing is that it didn't say in the survey, you know, whether, you know, these are the people that will pay more for a more stylish remote control, but I'm assuming, you know, yes. Well, that's when you go to uni, isn't it? So, you know Yeah. Oh, I've unplugged it. Do you want me to Yeah. Seventy six point three percent. Yeah. Yeah, I kn I mean I know what you're saying about the fifteen to twenty five year olds, but I mean it has been proven that that people of that age group have a higher disposable income because they don't have like I mean, you know, if you're at university, you're paying your rent, but you don't have a mortgage, you don't have a life insurance policy, you don't normally have a car, yeah, so. You're still learning to drive actually, so that just costs more than a car, but yeah. Um so I mean like it is an age group to target, really, I think. No, I mean that's what, that's like fifteen Pounds? You know, I think Yeah, I d I don't know many people without a T\_V\_. We didn't have a T\_V\_ last year, and everyone thought we were off our heads, you know. Yeah, I d well we've we've got quite a d decent T\_V\_. Yeah. I think I think the fact that, you know, ninety one point two percent of fifteen to twenty five year olds are saying yes, I would pay more for a voice recognition remote control, does say quite a lot really. You know, so I mean that and the disposable income and I don't think it's something to ignore, you know. Is not a massive difference, you know. No, do totally. You do have it in your mobile phone though, don't you? Because you have like I mean every mobile phone now has like call this person and it calls them. I don't know. Yeah. S so y you'd maybe need a code word. Do you know what I mean? So like when you say change, except that's being said quite a lot on T\_V\_, so maybe like, you know, remote. I mean how often do people say remote on T\_V\_? Although I only watch Charmed, so really I wouldn't know but like so you'd just say remote five, you know, remote ten, remote one two nine. I don't think there's a I

ot of uh voice recognition remote controls. Yeah, that would be another way to do it. Yeah, but then the code word would be even more important, because I mean Sky advertise on every channel, don't they, you know, so then it would be you'd be watching Charmed, and then the Sky advert would come on and it would change to Sky. Yeah, yeah, and that would be really annoying. Yeah. Do you not think that defeats the object of having voice recognition on a remote control though? Yeah, you know, so you have to have the remote control. It's more like if you lost it and it's down the sofa sometime, you can yell at it and it'll just change it, you can look for it later, yeah. Yeah, yeah, I suppose nearer to you but a b like if you have surround sound then Yeah. Yeah, 'cause it's it's quite important that you don't lose the the bit to locate the remote control. Yeah, definitely, yeah. Oh, so y you want our um PowerPoint presentations in there, hey? Okay. There you go. But is everyone's called functional requirements? Okay, so that's good. That's me done. Okay, cool. No. Mm. Um um wi on on a what? Oh project project documents, yeah, yeah, yeah, okay. Oh okay, yeah. Yes, I think so. Yeah, the last minute, yeah, yeah. Yeah. Um Okay. Hmm. Mm. Okay, yeah, afterwards, yeah, okay. Thanks. I think we need like some general discussion at the end probably. Yeah. Yeah, I think since since we were discussing some um design issues then I I I would like to continue okay, yeah. Thanks. Oh i Okay, I hope wait. Should it just There's just nothing. Oh right, right, right, um Okay. Nothin okay, something is coming up. No signal? Why? Oh. My my computer went blank now. Adjusting. But I don't see anything I don't see anything on my computer now. This is the problem, but Um. Uh now it's okay. No? No. Oh okay. Okay, that's fine, that's good. Okay, let's start from the beginning. So I'm going to speak about technical functions design uh just like some some first issues that came up. Um 'kay, so the method I was um adopting at this

point, it's not um for the for the whole um period of the um all the project but it's just at th at this very moment. Um uh my method was um to look at um other um remote controls, uh so mostly just by searching on the web and to see what um functionality they used. And then um after having got this inspiration and having compared what I found on the web um just to think about what the de what the user really needs and what um what the user might desire as additional uh functionalities. And yeah, and then just to um put the main function of the remote control in in words. Um so the findings uh were um that the main function of the remote control is is just sending messages to the television set, so this quite straightforward. And uh w some of the main functions would be switching on, switching off, uh then the user would like to switch the channel um for example just m changing to the next channel to to flip through all all of the possible channels, or then mm uh the other possibility would be that um she might just want to choose one particular channel, so we would need the numbers. And and also the volume is very important. Um um I als okay. 'Kay. Um um among the findings I found that m m most of the curr mm presently available remote controls also include other mm functionalities um in their design, like operating a V\_C\_R\_, but they don't seem to be able to deal with D\_V\_D\_ players, but then there are surely there are many other functionali functions that could possibly be added to them, but according to the last minute update um actually um we do not want to have all this complicated functions added to our design. So my personal preferences would be uh to keep the mm the whole remote control small um just like the physical size. And then it must be easy to use, so it must follow some conventions um like whereabouts you find the on off button and maybe the colour tends to be red or something. Um then yeah, the must-have buttons woul

d be on off and then the channel numbers and then um the one that allows us to go to the next or the previous channel, and then volume has to be there. But then um other functionalities um could be just uh there could be a menu button and you could change things on the screen then, um for example brightness and mm similar functions could be just um done through the menu. And yeah, the last question I had about whether we wanted to incorporate n uh more functionalities, the answer was already no because of the last minute update. So at the for the time being that's uh that's all. If you have questions Yeah, and also it's it's um other question is uh because there are so many different And there are so many different things that could possibly be included because besides video and D\_V\_D\_ there are the mm um video C\_D\_s and whatever, so it might be problematic to to choose between all these possible things. Um well, I think the buttons are still mm kind of the most um easy for the user to use, I mean um what other options would you have? A little screen or something, but this would be really kind of I think a lot of learning for the user and and I mean the user just wants to get um get a result um quickly, not to spend time in like um giving several orders um I dunno. I think I th I would I would think the put the buttons, but if if you have other mm proposals um. Yeah. Yeah. Mm-hmm. Yep. Uh am I going in the right direction? No. Wait. Okay, here it comes. Okay, here you are. Um that's very good, very interesting. Mm-hmm. Yeah. Yeah, you share a television or something that yeah. It was seventy something, yeah, yeah. Yeah this this is not unaffordable, but the problem is whether people need it, whether they do have a T\_V\_ to use its full Yeah. Common, the students yeah, yeah. The s the stu yeah, and the remote control might not yeah, it might not even function with the old T\_V\_. Yeah, we're still yeah. Or w maybe we can just kind of uh uh Yeah, but at the same time I think maybe we can we can just decide to to have both of these groups as our target, because actually I mean they're all still re young people. Yeah. Yeah. Yeah. Yeah. An Yeah. Yeah. Yeah but uh um Yeah, yeah sure, yeah, yeah. Yeah. Yeah, w well now the v the voice recognition if if it works wonderfully w we could possibly do away with all buttons, but I think this is not really the right moment yet, because people are just so

used to buttons and um, yeah it's it's kind of safer, so we we need both, so the voice recognition would be just an extra, it wouldn't really reduce the size of the remote. Yeah but m but on the other hand, remote control isn't as close to you you probably might just just uh speak into it and and the T\_V\_ would be already further away, so it might not pick up the other things coming from there. Yeah, but then the remote control I think I mean um the idea is kind of it's it's not that it's sitting there on on top of the television, because then you could already yell at the television and you wouldn't you you wouldn't need the remote control, so the remote control is still something you keep n near yourself. Yeah, yeah, yeah. No, but I I I was just defending the the fact why why we want to keep the remote control close to us, a and uh not to yell at it from the distance. Okay. Oh yeah, yeah. Okay, yeah, mm-hmm. The major ones, yeah. Mm-hmm. Mm-hmm. Yeah. Did you find it? It's just yeah, yeah. Oh so so we'll just put them i there, we we yeah, w we won't even okay. Yeah. Yeah. Uh something conceptual, yeah. Hmm. Sorry, but um the next meeting um are we going to have it um right after lunch or shall we prepare our To prepare, okay, yeah, that's good. Okay. Cool. Okay, see you. Mm. You said uh targ target groups, what does that mean? Uh okay, 'kay. So are Okay. Alright. I can go first, yeah. Right. Um so f from the Right sure. Uh okay. So n uh with uh with regard to the uh working design of this uh uh remote control uh I've identified um a few basic

uh components of the remote and uh se uh from the design, functional design perspective um w l c we can now uh know wha what exactly the components are and how how they work together with each other. So this is the method that uh I'll mostly be following in my um in my uh role. Um the identification of the components, uh and uh since since I'm dealing only with the technical aspects, I would need feedback from the marketing person uh and uh from the user interface person. Uh we'll then integrate this into the product design at a technical level and uh basically update and come up with a new design, so it's a cyclical process. Okay, so these were the basic findings from today. The last three bullets have been integrated from uh the last minute uh email. Uh I just quickly jotted them down. Um so basically uh the as I told you the identification of how the remote control works and what are the various parts to it uh and what are the different processes um and how the parts uh communicate with each other. Um okay, so e the mee email said that teletext is now outdated, so we need to do away with that functionality of the remote control. Um also uh the remote control should be used only for television, because incorporating other features um makes it more comp complex. And the reason why teletext is outdated because uh of internet and uh the availability of internet over television. How however, our our remote control would only be dealing uh with the the use for television, in order to keep things simple. Um also the management wants that um our design should be unique uh it so it should incorporate um colour and the slogan uh that our company um has it as its standard. Okay, so he he here is a functional overview of the remote control. Um there's basically an energy source at the heart uh which feeds into the chip and the user interface. The user interf interface communicates with the chip, so I'll basic go over to the Okay. So if uh if this is our energy source and this is a cell, uh it communicates uh it feeds energy into the into the chip, which basically finds out h uh how how to do everything. There is a user interface here. So whe when the user presses a button, it feeds into the chip and the chip then generates a response and takes the response to an infrared terminal, um which then so the output of the chip is an infrared bit code, which is then communicated to the remote site, which h has an infrared receiver. Um the there can be uh a bulb here or something to indicate whether the remote is on or communicating. Um so these are the essent so a all the functionality of the remote control, whatever new functions that we need to do, um make the chip more complicated uh and bigger, basically. Okay. Um so i in my personal preferences um I'm hoping that we can ke keep the design as simple and clear

as possible. This would uh help us uh to upgrade our technology at a future point of time. And uh also if we can incorporate uh the latest features in our chip design, so that our um uh remote control does not become outdated soon and it's compatible with most uh televisions. That's about it. So anything that you would like to know or No, I don't have any idea about what each component costs. Um yeah. Anything else? Yeah. Certainly, yeah. So so tha yeah, we definitely need to operate within our constraints, but um unfortunately I I do not have any data, so uh I just identified the functional components for that. Yeah, okay. Yeah. Mm 'kay. I it'll take some time. Oh, there it is, yeah. It'll come up, it um uh no signal. Yeah yeah, it says something now, adjusting Okay. Oh, that's strange. Okay. And one more time. Mm. Sorry, cou could you go back for a second? Uh switching on off channel, uh volume, okay, that's great. So in the u user interface requirements uh uh uh we we have been able to identify what are the basic buttons that we do want. Um but um so so at this stage, uh how we go about implementing those button we will not id

entify or I mean in we can completely do away with buttons and uh have some kind of a fancy user interface or something like that. But uh is is there any uh uh any thoughts on that? Right. Yeah, and it'll make the costs yeah. Right. Uh I think the co costs will also play a big role when we come to know about them. So well we can probably wait until t we have more knowledge on that. Uh i if the if the costs allow, we can have like an L\_C\_D\_ display and uh with um because we do want something fancy and fashionable as well. So yeah? Cool. try to press oh, okay, yep. Mm. Right. Mm-hmm. Mm. Right. Mm-hmm. Hmm. Right. Mm. Mm. Mm. Some kind of a ring, some Right. Hmm. Okay, that's great, thanks. Mm. I think one of the very interesting things that came up in um uh Ka Kate Cat Cat's uh presentation was um uh this this issue of uh uh like voice recognition being more popular with uh younger people. So if we need to have a target group um then uh I think as far as the m motto of our company is concerned, if we want to have something sleek and uh you know, good looking uh we are better off targeting a younger audience then um you know, people who are comparatively elderly. Um. Right. Right. Bu but but the survey did say that f things like voice recognition are more popular with them, so if you want to put in something stylish, then uh th it'll certainly be more popular with this i ye with the younger people as compared to older people, yeah. Right, and Right. Mm. Right. But uh still, if if you can go back to that slide and uh, how popular was it? Oh, oh, okay. That's alright, if you can just look it up on your computer, wh uh um people between twenty five to thirty five, uh how popular was so it was sti still still quite popular amongst them. So even they are seventy six percent, is that high amount? Alright. Yeah. So you're more likely to b Yeah. Yeah. Mm. Bu but even even in the case of twenty five to thirty five it's quite popular, right? So mm uh are are are Mm. Mm. Um I was having a a general outlook on um m most like sophisticated features, but voice recognition itself I'm not very sure about, because one of the p uh things that Cat pointed out was uh uh how do we go about implementing it? Uh and uh Yeah. But how frequently do we use it anyway and um uh h ho how good is it, you know uh voice recognition softwares are still quite uh Yeah. Right. Right. Okay. O Right. Mm. Right. Yeah. Okay, so it seems like a feasible thing to implement uh for for a limited yeah. Mm. W What uh Mm. What wh uh what I was thinking is that there is this uh separation between what the channels are on T\_V\_ and how they are numbered on the remote control. If we can do with away with that, our product can be really popular uh in the sense that uh a person can say, I want to watch uh I\_T\_V\_ one instead of saying that I want to go onto channel number forty five. Yeah, so if uh if something like that can be incorporated, some kind of Mm-hmm. Alright. Yeah, that's Right. Mm. Mm yeah and it might become very difficult from a distance for the television to understand what you're saying because of the noise factor for the remote control being cl I mean it'll it'll mm. Yeah. Mm. So uh wh another thing uh

that can be used is that uh there can be a beeper button on the T\_V\_, so you can go and press that button and um and the remote control, wherever it is, it'll beep, so we we can probably come to know where it is. Right, yeah, yeah, yeah. Alright, yeah. Right. Okay. So where exactly is this i Ah, okay. Yeah. Yeah, yeah in that one, right yeah. No. Right. I guess I'll find out. Wha what was it again that I was supposed to look into? Con components, oh. All hooked up. Okay, so now we are here at the functional design meeting. Um hopefully this meeting I'll be doing a little bit less talking than I did last time 'cause this is when you get to show us what you've been doing individually. The agenda for the meeting, I put it in the sh shared documents folder. I don't know

if that meant that you could see it or not. Did anyone? No. Oh well. Um I'll try and do that for the next meeting as well so if you check in there, there's a shared project documents folder. Um and it should be in there. Project documents, yeah. So I'll put it in there. Is it best if I send you an email maybe, to let you know it's there? Yep. I'll do that next time. Um I'll act as secretary for this meeting and just take minutes as we go through, and then I'll send them to you after the meeting. The main the main focus of this meeting is your presentations that you've been preparing during the time, so we'll go through each of you one by one. Um then we need to briefly discuss the new project requirements that were sent to us. I just sent at the last minute, I'm sorry about that, but we can see how that affects what you were you were doing. Um and then we need to, by the end of the meeting come to some kind of decision on who our target group's going to be and what the functions of the remote control that's the the main goal is to come up with those two things, target group and functions of the remote control. And we've got forty minutes to do that in. So I would say yeah? As uh who it is that we're going to be trying to sell this thing to, yeah. So we need to yeah, we need to have a fairly defined group that that we want to focus on and then look at the functions um of the dem remote control itself. So with that I think it's best if I hand over to you. Does anyone have a preference for going first? You wanna go first? Okay, so we need to unplug my laptop and plug in yours. I assume we just pull it out? Just before you start, to make it easier, would you three mind emailing me your presentations? Once we you don't have to do it now but when once you go back, just so that I don't have to scribble everything down. Hmm. Mm-hmm. Okay. Do you have any um i idea about costs at this point? Br Okay. 'Cause that's something to consider, I guess, if we're if we're using more advanced technology, it might increase the price. Yeah. That's fine. Are there any more questions, or shall we just skip straight to the next one and then we can discuss all of them together at the end? Yeah, I think that will do. Okay, so do you want to Yes, shall shall we pull this up? I think that has to come out of there. Yeah. Yeah, I thought those last minute things, they're gonna hit you the worst. It ta takes a little Oh, and have you you need to then also press on yours, function F\_ eight, so the blue function key at the bottom and F\_ eight. Now it's coming, computer no signal. Maybe again? Okay, adjusting. There we go, there we go. Oh, if you press if you press function and that again there's there's usually three modes, one where it's only here, one where it's only there, and one where it's both. Okay, so one more time. Should yeah just wait for a moment, adjusting. Okay. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. If I mean that was the the directive that came through from management, but if we had a a decent case for that we really think it's important to include video and D\_V\_D\_, I could get back to them and see. It's w it's just whether it's worth arguing about. Mm-hmm. Yeah. Mm-hmm. Okay. Are there any questions for clarification of Maarika before we go on to the next one? Mm-hmm. Mm. Mm. Mm-hmm. Sure, we can discuss that maybe after the next one. Do you want to yeah. Oh, I'm getting hungry. You set? Uh we need to do the function key thing so that it comes up on here. Hello. Is it plugged in prop it's working? Okay. Excellent. It's um switching between channels, sort of randomly going through. Mm. Ooh, that's a bit difficult to see. If you explain it to us it'll be fine.

Yeah. I liked the, I liked the litt ooh come back. No. Okay. Mm-hmm, that's the next one along, yeah? Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. The remote control. Mm-hmm. That's alright. Mm. Keys and things like that, yeah. Whistle and it screams at you, yeah. Mm-hmm. That's you, excellent. Um. I'm

just gonna tick yes. So, we've got about ten, fifteen minutes to discuss Mm-hmm. Yeah. Mm-hmm. Yeah. Then again I guess the th where it was most popular was the fifteen to twenty five bracket and the I don't know how often they're buying televisions. Yeah, but you don't have much money, generally. I would've thought it's it's more that twenty five to thirty five, when people are really moving out and they've got their first job and they want their nice toys and O oh it's on sorry, we unplugged it. Here, let me Yeah. Mm-hmm. Yeah. Yeah, they've got no commitments and usually not a car and all of those things. Kids. Yeah. Yeah, and if we're if we're talking twenty five Euros as a price, that's not unaffordable, even for young people. Yeah. Yeah. But do they But the T\_V\_s are often kind of someone's old T\_V\_ that's blah blah and be a bit strange to have a fancy rome remote. Mm. Yeah. Yeah. Yeah. Yeah, if we ta if we take fifteen to thirty five, but that then does imply that we should try and incorporate voice recognition. Is that gonna have a an implication for the technical specs? Mm-hmm. Yeah. Yeah. With um but with a T\_V\_ remote it's gonna be quite limited if we're t saying the main things people want to do is on off channel five, louder, tha that should be relatively simple. Mm. Yeah. Mm-hmm. Yeah, but maybe if you wanna look into that just to just to check. Um, so if we go for the the fifteen to thirty five age group and then of course we're going to get th anyone who's older than thirty five who wants to look young and hip and trendy and has the money, then they'll they'll still go for the same advertising. Yeah, I think we need both. Yeah. Mm. Uh-huh. Uh-huh. So that if that was in the the voice recognition, that would be great. Yeah. Yeah. Watch Sky and yeah. Mm-hmm. But that's definitely a possibility. Yeah. So that you can yell at it, yeah. Yeah. Alright. Mm. Yeah. Yeah. Yeah. Yeah. Mm-hmm. That's but then if you're buying the remote separately, but y you could have something, but i if it was something that you could like stick onto the T\_V\_ or something, some like a two p if you bought it in a two part pack, so one part attaches to the T\_V\_. The I Well that's right, but it solves the problem of having different noises. Yeah. Okay, I think we're gonna have to wrap this up um. But if we go away with that that kind of general um specification in mind that we're looking at fifteen to thirty five year olds, we want it to look simple, but still have the buttons so it's easy to use, but only those key buttons, the major buttons and then one sort of menu one, and then voice recognition included as an option um but that obviously needs a little bit more working out as to whether it's really feasible and some of those problems we were mentioning um. What we have to do now is to go back to our little places, complete our questionnaire and some sort of summarisation, which y you'll get immediately by email. Send me your presentations so that I can use them to make the minutes, and then we've got a lunch break and after lunch we go back to our own little stations and have thirty minutes more work. Um I'll put the minutes in that project documents folder, but I'll send you an email when I do it, so that you know. It should be on your desktop, so on the yeah. So I'll put it I'll put them there as soon as I've written them. Yeah, and email them round. Yeah, that would be great. Oh yeah, put them in there. Yeah, then you don't have to email them. No, they're all called something slightly different. Technical requirements and something something, yeah. So, if you put them in there, we'll all be able to see them and refer to them if we need to. Um as to where we're going from here, you're going to look at the components concept. Yeah? Whatever that means. Yeah. You'll be looking you'll be looking at the user interface concept, on something conceptual and you're watching trends to see how we go and surely voice recognition'll fall

off the map or something that um we'll keep keep our options open hmm? Components, yeah. No, we have we have after lunch we have thirty minutes to ourselves to prepare, so that's fine, well before lunch we just have to complete the questionnaire and some sort of summary. Okay? Right on time. Okay, so you can I guess we'll see you for lunch in a sec?

# Meeting ID: 127

Data Source: Train

## Executive Summary

In the detailed design meeting the team created a prototype. Along with buttons for numbers, channel selector, volume, mute, on-off, teletext, and subtitles, the prototype included an LCD screen and a help button for functional information. One rechargeable battery, single-curve form and plastic case, brought the total cost to 17 Euros. To reduce this cost, it was decided to replace most buttons with a scrollwheel. The remaining buttons were one for channel selection, one for volume (both assisted by the scrollwheel), teletext, on-off and the help button. A suggestion to target the product to a younger or perhaps more general group was met with approval. All these components were re-arranged in a revised prototype. It was evaluated on a scale from 1 to 7 on the basis of the following criteria: fancy design (6), technological innovation (4), functionality (7), consideration of the target group (3). The remote was also recognisable as a fashionable Real Reaction product. The project process was deemed well-structured, although everyone thought it would have been better had they known the component prices at an earlier stage. Teamwork and leadership were good, but room for creativity impeded by budget constraints.

## Complete Meeting Transcript

Okay. Well this is what me and Richard came up with. The default spot for the on-off button. The mute button just below that. Then there's the volume and channel selectors. Simple plus-minus button. Uh we thought of a help button. If you hold it and you press another button, uh the help goes to the L\_C\_D\_ screen. Then there's the zero to one to zero buttons. A button for teletext. A button for the subtitles. And the company logo. So it's rather simple prototype. And uh we'll have to see from testing uh how the users take it. Sure uh just pop in at any time. I think if you look at most controls, they've got more buttons than this. And well the on-off button, it's it's a necessity. You can't drop that one. The volume and channel buttons, you need you obviously need those those. The mute button could be replaced uh by pressing the volume-down button twice. So we could cancel that one. I think the help button really is necessary because there's no other way to know when someone wants to know what a button does. Well, you can't leave out the number buttons I guess. And Yeah. So it's rather basic

already. Yeah, they're It's rather hard to draw on the white-board. But they're supposed to be equal sized, round, with a with a little logo on it for the for the volume, the the triangle and stuff. Just for recognition. So and for the materials we've just chosen for rubber buttons. With a a different colour than the case. So they jump out. And uh that's about it. Yep. Yes. Yep. Yep. Yeah. Yeah. Yes. Uh that's that's a big cost. If we leave out the display we can also save money on the chip. Which isn't the the docking station isn't even in this c s schematic. So it's not even taken into the price. We we could save money on it. But would it make the remote more usable for elderly people? My mother can't even send an S\_M\_S\_ message. So Yeah. The margin will get too small. Yeah. Ten. No remote. That's We're getting closer. Yeah. You could just not scroll for a half a second. So you won't need a button. If you want to use an L\_C\_D\_ screen you need an advanced chip, yes. Yep. Yeah if you v could just leave out one more button. Yeah. I think so. Yeah. What if you have to scroll to page eighty eight? Eight hundred eighty eight. Yeah. Okay. No. We could make two buttons out of that. And just um If you press the volume button you can control the volume with the scroll-wheel. So that would save two buttons. If you do the same for the channel. More obvious. So if we Yeah. So If we leave out all those buttons, perhaps you can go with the flat flat case. And make it smaller overall. So if you put the the volume and channel buttons on the same height as the on-off button, the screen right behi under that, than the scroll button you get a a much smaller remote. And it sh Yeah? Yeah. Richard's argument was very good. Yeah. Yep. Yeah. Six. Yeah. Four or five. Yes. No. Mm, we haven't thought of that one. I think that's a three. I still I think it's too m too fancy. Too too flashy. Twendag sieven an twendag. Yeah. Yes. Yeah. That's true. Yeah, there w there was enough room, but the finance uh Yes. Yes, was okay. The tasks are very structured, so you can just do step by step and it's very easy. Well, the smart-board, the d d drawing is just a pain in the ass, but The digital the digital pen is very nice. Yes. Yeah. A flip-over or a more precise uh digit Yes. No. Didn't work. Yes. Yeah. Considering we are not going to make a docking station. Perhaps. Mm-hmm. Okay. Okay. Good afternoon. So Hello. No problem. Okay. That's possible on uh this time of day. Starts at three o'clock. Uh Uh, let me see. Our fourth and last meeting. There he is. Yes. Okay this our last meeting. In this meeting we will discuss our final design. And we will do some evaluation about the, not only the product, but also the project. And then we're going to close the project today as well. So after this you will be uh free to go and uh spend all your money. And this uh design, detai

led design meeting uh we will discuss uh the look-and-feel of the design, the usability interface design, and we will do the product evaluation. Um, in order to do that we have this agenda. We'll have the prototype presentation first. Then we will set up some evaluation cri um criteria. Then we will look at the finance. Uh we will have to see if everything we wanna do is also possible within our budget. Because everything costs money, and the more functions you wanna have the more money it will cost. So we have to see if it fits within the twelve and a half Euro per remote. But we will see that later. Then we will do the project uh evaluation, and the closing after that. We've got forty minutes. So we will be finished at half past three. But first um we will do the this is prototype presentation. So, if some yeah if somebody wants step forward. Okay. Okay. Uh but um I thought in a few meetings earlier we uh uh tried to keep it uh simple. Uh just a few buttons and large buttons. But uh I think these are altogether quite a quite a few buttons. So I'm wondering if we if we neely really need all of those buttons. That's right. Yeah. Yeah. Mm. Long time. Yeah. If you put Yeah. Okay. Yeah. Uh teletext and subtitles are yeah necessary. Okay. Yep. Okay. So we had somebody about th interfa Something about the design of the buttons there? Just n normal plain buttons. Yeah. 'Kay. No. No. Yeah. Okay. Yep. Okay. That's nice. Then because we only have thirty minutes left, I will move on to the finance part, which is pretty

exciting, to see if it's all possible what we wanna do. And I can tell you that we're going to have a pretty hard time producing this for twelve and a half Euros. If we see I don't know if I've filled in correctly, so just correct me if you see uh something wrong. I counted two batteries. But maybe we can also use one. I don't know if it's possible. It's rechargeable. That's right. Okay. That's two Euros off. We need the advanced chip. So there's not much to uh to save there. Here we have the single curves. Uh we can see that the difference between uncurved and the single curved is one Euro. Um, I don't know, but I think the single curved is good for design, and also for the display to have a prominent place on the remote control. I think we have to keep that. Then we have the case material supplements. It's plastic. It's the cheapest one we need. So that's uh not much to save either. But then the biggest costs are the buttons. So maybe we really should try to discard some buttons to uh keep our costs low. Because you have to we will have to get the twelve and a half Euros at the end. Um, so if we Let's fir first count the buttons we have now. Because I Sixteen. Nah, that will be even more then. Eighteen Euros. So, seventeen. Okay, including the help? Yeah. Uh seventeen. I think we can uh discard the help and the mute button uh by pressing down volume long, or pressing down a a number long. That saves us uh one Euro already. 'Cause then we have got fifteen I think? Fifteen buttons. And this is No those are one, I think. Yeah but th it's not stated in this files. So maybe we can we can even make one button with the volume and the channel in one, by pressing That's possibility as well. So And it's good for the design as well. So you can make Uh let's see. If you make this Looks a bit like uh a cross. Plus. Min. Uh s yeah channel. Yeah w Yeah th I think they count uh the materials. Yeah on the chip there. Yeah. That's right. That's right. But I think because we have the advanced chip we can just count this as one button. But No but I think Yeah. Maybe it is, but then it seems to me that it's impossible to get the twelve and a half Euros. Also the L\_C\_ display, I think it's, I think it's too expensive for the display we use. I think they uh try t That's right, but what's the big advantage of our remote then? Yeah. No. That's extra. That's extra. That's right. That's an option. Poland. Something. Polish supplier. Don't you thi

nk we can, if we can count this as v as one button, and integrate th uh these buttons in three, then we save a lot of money as well. Yeah. That's a point. Yep. No. Yeah but uh we have to stick to the twelve and a half Euros. We don't have any more budget to develop it. Yeah. So It is. If you leave out the L\_C\_ display. And if you use less buttons. Say Or you can take the single chip. There it is. But then w Good looking. Yeah. I think it's uh difficult as well, but Or we can leave out the ten buttons and take one scroll wheel for the programme numbers. Then w Because then we save ten buttons. Then we have five and one. And and see. If we have this one and we've got the advanced W uh, we're getting close. Then you will Or maybe you can um scroll. If you scroll you will see the numbers on the L\_C\_D\_ display. Until you've got the right number, then you push it. Alright. It's gotta scroll and push. Okay but then you you can push uh some other button as well. Yeah. That's right. So if you scroll to a number and then you wait a half second, then it g turns to that channel. But it would definitely crop cost, a lot. And we need the battery. And the regular chip is not possible? It has to be advanced? It has to be advanced. Yeah. Okay. And we can save a Euro by a flat design. That's an option we can Then we're almost there. Yeah. So if we Yeah but I think that's That is a big advantage, if we're But Can we use can't we integrate the teletext and the subtitles in one button? If you push it three times? Yeah. Ah that's not really that No. I think if you make a good advertisement uh on television and in the in the guide, you can explain to the people how to use the scroll wheel. If you just make it real simple. Because it saves it saves a lot of money. And we can keep our L\_C\_D\_ screen, which can provide extra information. How to use the scroll wheel. How to use the other bu buttons as subtitles. And it's good for the innovative design as well. If you would erase these. Mm eraser? And we put uh Looks a bit odd maybe. That is

Something like that. Then, yeah. We've got the scroll-wheel. One, two, three, four, five buttons, if we erase this one. And these are two buttons then. Yeah. Yeah. That's really a good good idea, I think. And it will make the use of the scroll wheel uh more obvious indeed. So we make one for the volume, one for the channel. Plus scroll. That's right. So we've got one, two, three. Yeah, we can leave the teletext in if we want. That's m that's better. Y yeah. Mm yeah. Uh yeah, and then you can That's right. So we can decrease this one to four buttons. Yeah. That's no problem. Yeah. Yeah. It's uh it's more the moulds in which they are being made, I think. Single curved is really easy to just fill in. And cases come right out of the machine. And single curved you have to have a different uh different machine, than a flat one. I think this is a really easy one. Um, what does everybody think about a flat or a single curved design? Freek, what do you think? Yeah. Yep. We have to cut costs. Yeah. Yeah I'm ag Ask for more money. Yeah. Yeah. I am agreeing with the usability. Yeah. Yeah. But th um I think we can then keep the single curved one. Just to express our L\_C\_D\_ screen a bit more. So people will use it more, and especially for the help functions, it will be good if we have scroll bar, scroll button. It will be necessary to have good help function, as well. So this is scroll. I think it was better to have this price list a bit earlier. Before we went on to the to the whole design. But I'm glad we could make a bit. It's pretty different, if you saw the last one than this one. Yeah. It will. Yeah. No, but I think I think the most That's right. We can let I We can stick it out, a bit. Like a old old buttons. Maybe that's recognisable for them as well. Yeah. That's a good one. So, I'm afraid we have to move on. And it's uh it's b uh less frightening, I think. If they see this design they think oh, there are only five buttons

, and uh But we will see. Yeah. That's definitely right. Yeah. I would buy it. That's right. I would buy it if I was six. No I don't know. What it costs under twelve and a half Euros? No? Uh, yes they are. No. But we can go on with the project evaluation. Let's see. I can sit down I think. We still have fifteen minutes left, so we're nice on schedule. Um, the project process. Evaluation criteria. That's right. That was the point I forgot. I should There we are. Evaluation criteria. Go ahead. We've got five minutes I think for those criteria. No we've got fifteen minutes but Uh yes. What? Uh yeah. Okay. Yeah, that's because my pen failed to upload his data. I tried to but it's uh it's giving errors by downloading the software. I think it's fancy. Yeah. Six. Very. Subtitles, buttons. Yeah. Seven. Yeah. So we've got twenty cents for our docking station, huh? Yeah. That's right. That's a bit dodgy. I would say four. Four or five between. Between four or five. Yeah. Is it functional? Yes. No. Think it's uh seven. It was. I had them worked out. Mm. They are ugly, not very functional, and getting lost. Yeah. No I think with our new radio button, I think it's uh I think it's better. I think it Yeah. I would give it a four. Then we have to do the three. It's the Yes it is. Yeah. And they wanna put fashion in their products. Uh in the slogan of the company. And we have the removable front cases. So, I think it's very recognisable. Yep. We've got a calculate it. Mm? N We've gonna We're going to evaluate it. Forty nine. Forty one. That's Around eighty percent. What is it? That's eighty four percent. I think that's a pretty nice score. Okay. Thank you. So, that brings us to the project evaluation. Yep. Thank you. Project process. Did we move through the right phases, you think? Along the process? That's right. So lack of information about prices. Okay. Uh Okay. Satisfaction. Was there room for creativity? No? It's because of the finance sheet. Yeah. The room was Yeah. Restrictions. Internet access. 'Kay. Leadership. Was it clear what everybody had to do uh according to their roles and functions? Yeah? Teamwork? Did it work out? Working together? Also, you two of you with the uh last phase? Nice. tasks. Okay. Were the means sufficient for the tasks uh we had to do? Or were they too much? Smart-board. If it wants to download its uh data. Failed download. Smart-board was irritating. So you rather wanted to have a flip-over? Or something else? Faster as well, I think. Yeah. Flip-over. Yeah. Uh you need a smart board uh application I think. But I think you can Yeah.

Should be possible. Yeah you can export it as image. Must Yeah must be So the sharing of the information was uh was okay? Uh, network. Yeah, pen is here on the table. Yeah. It's possible. Okay. That's nice. Have we found new ideas for having this kind of meetings? Or Yeah. Yeah. So Yeah. So everybody puts his own score. And then it mediates the score, and you can get one Yeah. That's better. So that's uh How do we call? Evaluation criteria. Okay. Mm, any more ideas? Or questions about the project? Or about the product? Because I think then that we get to our last sheet. Are the costs within the budget? Yeah. Do we Docking station. That's a good point. But maybe because of the docking station the price of the remote can also be a little bit higher? Uh and I think you can compensate that as well. So I think that shouldn't be the biggest problem, because it's very cheap to make as well. Do we think we gonna get the twelve and a half million? Or what was it? Fifteen fifteen million. I think we will. If we gonna export this product. It's innovative. Especially in America. People are pretty decadent. Sometimes. You can do more. Yeah. Just put it on the market for everybody. You can you can change markets where by changing the front covers. That's one thing you can change it with. So you can also try to uh reach the younger people by uh putting fancy covers on on the market. Just as a

test. See how it works. That's I think a good advantage. Yeah. Uh, uh then I think we can have our little celebration, right now. That's it. Yeah. I think we still have to fit in one more questionnaire. I think. I don't know. I didn't get a message from the from ending of the Oh I think I have one now. Five more minutes? Oh that's nice. Then we still have some questions. If somebody has some questions they can ask them now. Or we can put these in the project folder as well. Maybe that's Export as picture, I think. Hmm. This is another network, I guess. Does somebody see the project folder? I don't. Hmm. My Documents. Yeah, I'll just put it in My Documents and uh That's okay. Okay. I think I'm going to make our final presentation now. And then I will be back in about ten minutes to show you the final presentation. Summary of the project. Yeah. Questionnaire. I think you all get a questionnaire in in your room. And then I'll meet you in I think about ten minutes, or something. Okay. Thank you. Hopefully my pen will download its software. Oh. Or data. So Yeah. Yeah. Uh, that's just uh the normal uh as th as the normal uh remote controls uh So um You put it uh you um came in uh page uh one hundred. Now you can use the normal uh one to zero buttons. And you But you can also uh use the um button th for uh changing the the channel. S so uh the shifting uh button. Uh for uh yeah shif shifting up in uh on t on t uh teletext, and shifting uh down. So Oh yeah? Yeah. Yeah. Yeah yeah. Uh, or you can build in uh when you press uh one button uh uh Yeah. But m Yeah. We disc discuss that already. But uh we think uh old people uh don't know that uh option. So uh they just put in uh put press uh the button and uh And uh Oh. Yeah. Yeah. Yeah, it Yeah yeah. Just to recognise it, so uh Uh yeah and now we don't need uh LEDs or um Y uh s some uh remote controls uh do it also, but um uh because we use the little display we don't uh have to use it. Uh so Nay. Mm. Yeah we can u just uh 'Kay. Mm. Yeah. Yeah. Okay. Yeah. Uh Sixteen, I believe so. Uh seventeen. Uh with the help button. Yeah.. Yeah. Where did uh Uh, it's just one button. But, um Yeah. There were uh two uh for one big button. But they are uh more expensive than the small ones. Uh, yeah. So It's just a. But I don't don't know if if it's cheaper. So uh, we've still got four buttons, but just um So You got uh not not a butt button itself, but uh on the um Yeah. On the chip you've got still uh four uh four buttons. So Yeah, but. Are we gonna buy a um a remote control uh when you can uh use it? So um Yeah. We m uh we must um stay below the um below um twelve uh fifty or Can't uh go um Nay. Is it impossible to But it is possible to make one uh for uh twelve fifty. I don't think so. S Yeah. But, you can't use uh Yeah. But we want to make a uh so uh uh fancy and a good uh Yeah. Uh, wi with n Oh, with uh attractive uh o options. So uh, you can stay uh below uh twelve fifty. So Scroll-wheel's one. No, it Yeah. Yeah. Mm. D yeah. Hmm. Ja ja. Yeah, or we have to uh skip the subtitle uh button. So

Yeah Yeah it's a big advantage. But um, it's Uh, yeah. Yeah. Yeah. But if you push the teletext button twice It's uh One m uh one b uh, a few buttons. Yeah. Hmm. Yeah. Uh yeah. But uh, you can make a f quite a big uh remote remote control for uh just the same price as a small one. Just uh you only have to pay for the double curved or single curved. It uh it's a bit uh.. Yeah. Yeah. Yeah. The th No. But um But they know the scroll-buttons from uh old radios. Uh they cal also uh buttons like that for uh changing uh channels. So maybe it's uh Yeah. Yeah. Yeah. Yeah. Mm-hmm. But very special, so uh No. Mm. Yeah? Mm. 'Kay. Uh six. Yeah. Mm. Sh Yeah. Mm. Not really. For old people I I W Yeah. Four. Yeah. N Yeah. No. Mm m Yeah. Mm, th yeah. Yeah. Uh We have to test it s But Uh, yeah, true. I go for three. So Yeah yeah. Yeah. Hmm. Yeah. Yeah. But it Yeah. Yeah. Yeah. Yeah.. Mm. Yeah. So Yeah. Mm-hmm. Mm. Yeah. But Uh Ye

ah. A flipper's uh easier, so Yeah. But if you want to share uh of uh when you make um a picture like this uh on the presentation, it's easier to uh share it with uh other people. Uh so uh you can sh save it uh and uh put it on the internet, or uh uh in shared f uh folder or uh sh uh shared directory. So So Yeah? No? T can uh can you export it uh like a Yeah.. Uh. Uh, yeah. So you can Uh It's possible. Okay. Um, yeah maybe um uh when we n uh just uh give the numbers of of uh Uh uh o one of uh out of s uh sev Um it's uh easier to uh to do the th things that are like that on a computer. Uh, so uh just I uh like uh at u university uh So Yeah. Yeah. Mm. Mm yeah.. Mm. Yeah. Yeah. Mm. Yeah. Ah. Ah. Ah. Hmm. Where's the champagne? Uh, I believe y uh Okay. Yeah. Yeah. Uh maybe uh they will save it. So uh Okay. Uh maybe we have to fill uh another questionnaire. So uh Yeah. Yeah. Okay. Good afternoon. Sorry I'm a little late. Got stuck in the traffic. Yeah. Um, is this the moment where we ask or can ask questions about the functionality? Um, when you're in teletext there usually are buttons where you just you just press it and you g go to the next teletext page. Mm-hmm. Okay. Okay. Um Yeah. Yeah. Yeah. Think so. That's what I pointed out earlier. If you just make a control for just the T\_V\_ there's just not much to gain here. Since it rechargeable. Um Damn. Wouldn't Yeah. No. That wouldn't be an option. Uh, d I assume you'd count the volume and channel thingies for two buttons each, right? Well, think actually there're two buttons, aren't they? Well I was thinking, maybe you could just integrate three of those numbers to one button. That would cut the cost. Mm-hmm. Yeah. But, I think this really is four buttons anyhow. Yes. Only the docking station, I guess. Maybe we should to a different supplier. Yeah. Yeah, that's what I'm wondering. Um Well, since the market research indicated that older people spend their money easier, more easy, maybe it's feasible to just put the price of the remote up a little. Especially since we have those nice features. It would be a be a pretty rigid one. Or b Basically becoming a choice between like either a good remote and a higher production cost, or just any other remote control. But how does scroll-wheel work here? That would bring up the price of the scroll-wheel also. Integrated scroll-wheel push-button. But Yeah. I think that would be like the end of our usability. Yeah, but Well, think it's pretty much the teletext subtitles are right now you just push the teletext button, go to page eight eight eight, and teletext disappears. But the subtitles stay there. I think that's the case on most Well, that could be just uh like the scroll to eight, click, scroll to eight, click, scroll to eight, click. But then again that would be d j just pretty much not an option for older people, who don't even know what a scroll-wheel is. Holding a remote with which they expect to have like ten buttons for the numbers one to zero. With only five buttons on it. And a scroll-wheel. True. True. That's a pretty big scroll wheel. So this is five buttons. Right now we have five. Mm. Well, I still think we should go for the single curve design. But then again, all these changes are not really okay with me. But since we just have to. I'd rather just go to the board and get us to spend eighteen dollars a a remote. Or do some market research and see what the options are. Yeah. Yes. Definitely. Yeah. It's pretty different. But this

is not really like for the group we were making our remote. This will really require a lot of marketing to get this to sell. 'Cause if older people like familiar forms and familiar stuff. This is not familiar for them. So we're gonna have to do a lotta convincing them. Yeah. That's true. Might uh might be confusing too. They'd be like, what? Only five buttons? Yeah. But you're not sixty. Mm-hmm. So um, I like set up all these criteria. And evaluation of the thingy. Thank you. Five more minutes? Okay. 'K

ay so I did some literature study study, and analysis of the requirements we set up earlier. Translated it into criteria, which would be these. Um, is the remote fancy? The shape, look and feel. Innovative? What new functions are there? Uh, easy to use? Uh, learnability is a very important factor here. Uh, is it functional? Are there not too many functions uh among the functions? And are the those functions that are there, are they useful? And the cost. The target group. Is the remote really for the group we're making it for? And recognability. If our company is If it is easily recognisable that our company made it? And So we're supposed to evaluate it right now. Let's see. Oh I have to say this was a little hard, because the minutes of our last meeting were not here. Okay. Interesting. So Is the design fancy, on a scale of one to seven? We all go for six? Good. Um, is the design innovative? I think so, with our L\_C\_D\_ screen, docking station, scroll-buttons. Seven? Should be do-able. Is the design easy to use? Well Would be for us. But I'd go for four, too. Is the design functional? Um, do we have all functions that we want to include? I think we do. Do we have too many functions? I don't think so. It's pretty slim. Seven. Oh, and do we um take care of the biggest frustrations of the remote control? Like it getting lost and R\_S\_I\_ influences? Think we do. Are the production costs within the preset limits? Well they are now. Does the design fit the group of focus? Yeah. I think it doesn't. I don't know. I think I think a radio button is not exactly what older people expect to have a remote control. I'm not sure. I think I'd go for two. 'Kay. Is the company company recognisable? Well, we have the logo there. So Yeah. So that will be this. I was also supposed to calculate the score, but thought we would have another private thingy after this. Is this Like after this, are we done? Or We're gonna go to our other room again. Well, anyhow. These are seven factors times seven is forty something. Two? No. Nine? Uh, minus one. Minus three, minus four. Minus four. So that would be minus eight. Forty one out of forty nine. Okay. Guess I'll just type that in on the bottom here. Hmm. 'Kay. So that will be the evaluation. Think we should have a should have had the finance thingy a lot earlier. In the design phase. Yeah. Definitely. No. Not too much. No. Yeah, true. But And I would've liked to go for the younger users also. And just to be able to access internet and get something of your own. Yeah. Mm-hmm. Yeah. Yeah. Yeah. Yeah, I tried to open the file on my laptop, but not possible. Yeah. no. Should've done that then. Pen is here. Mm. Yeah. Mm-hmm. Yeah. They are. Yeah. Fifty grand. Yeah. Yeah, still I think I mean if we're n gonna make a scroll-button anyway it'd be more for the younger people than for the older people. So maybe we should just re-focus. Or specifically for younger people. That's true. Yeah, I think then it would be way more uh popular with younger people than it is, than would be with older people. Even if it were their covers. But Party party. 'Kay. Oh you did. Mm-hmm. Yeah. Yeah, it probably will. Oh yeah, you're supposed to make a final Are we supposed to go into our own rooms again? Yeah. Yeah. That'd be nice.

# Meeting ID: 58

Data Source: Train

## Executive Summary

. I did get a bit more done than the last time , 'cause I knew that I didn't have time so I just copy and paste everything into the Sometimes I have these pop-ups or these sounds and there's nothing there , and also with I don't know how to use PowerPoint , so it takes me forever to get something done with it . Uh we have again three presentations and then we have to decide on what concepts the mobile phone has to uh f the remote control has to support . So welcome to the marketing presentation once again . Um fashion watch watchers uh have detected the trends for young public , because that's our public . fruit and vegetables will be will be the most important theme for clothing , uh shoes and furniture . And the feel of the material is expected to be spongy . oh yeah well this is the fruit and vegetables looks of fresh bright colours . most important aspect for remote control happens to be a fancy look-and-feel . Instead of the current uh functional look-and-feel . And the second most important aspect is that a remote control should be technological uh innovative . I think we pretty much covered that with our screen and um and speech recognition , And the third development um is that the remote control should be easy to use . Well the first aspect uh was twice as important as the second aspect, which was twice as important as the third aspect . Uh nothing about the buttons but just sponge kind of thing , and and some fruit and colours Just made a quick design . I'm dealing with the components design . I uh used some design examples we had uh from similar products . Uh for example the energy source . we have four types . The basic battery . Uh we have a hand dynamo , Uh the kinetic provision of energy which means if you move the thing , if you shake it . And uh of course solar cells . for the uh a case , there's uh the traditional uncurved flat hard case . Single curved , which means that it has uh curves in one dimension . Or the double curved . but well you know that we will have to go for the double curved 'cause it's daring and different from what we have now . Well we have all kinds of hard uh materials like the the hard plastic , the wood and the titanium . I would definitely go for rubber We have yeah several uh interface designs . Uh we can use a scroll buttons for the menus , but we already kind of decided to go for the f for the pushbuttons , for the the arrow buttons . the advanced chip I think is easiest to implement uh for the production , 'cause they they can print it better . I first uh chose for the battery , 'cause yeah I'm traditional and that's the most obvious , easiest choice to go to . But I really think that we should maybe uh think about the kinetic energy , I can imagine that the kinetic uh type energy source would be more expensive to make . But it is more longlasting , that the people don't have to ever buy

batteries again . and especially when the material's rubber . It can be done , I mean , you can't harm it , So double curved is like this , this , this , or No it means curved in two dimensions . So uh w single curved ? Uh let's say would be a b square box , but then with curves on one dimension . One one uh very important thing I was uh yeah thinking about is the speech uh option . I think you can just uh match the speech commands with the functions that are already present . But do uh j do we uh do the speech just for the basic options , for the simple buttons ? For for everything , in the in the last uh meeting we uh we were yeah putting the the simple and the advanced options separated . Pressing the the menu option uh will disable uh all other options on your uh remote control . And only the the L\_C\_D\_ panel will uh light up and then you can only uh change the yeah the options . but this is the the the simple uh layout . Uh display on the upper side with the the menu button and maybe a some sort of cancel button or save button . And uh if there are older people they wanted more uh yeah more uh luxurious so that's an a also an option . So we only , we already decided that kinetic would be the choice for energy . Uh the case would be doubly curved . So Rubber material . Advanced chip . Okay . I'm just thinking , this is not my department , but I I'm not sure what this is gonna cost , I didn't get any information about that so Uh do you have a picture of doubly curved case ? This is the the menu I was uh looking uh at . S see this is the the the standard traditional type , where the form uh yeah serves the function , you know . But this m is more appealing to old people and we don't want that . And th that means curved in both dire dire uh dimensions . where your thumbs would be laying in the instrument and it has to be nice to hold . And Th this looks a little bit like like for only for children . So Yeah but that's that's the the problem uh yeah the dilemma actually , 'cause we wanna appeal to the to the young public with fancy with flashy colours , and with a lot of shape . Yeah , and the and the rubber , it it will look cheap always , Okay but the the colours , you you can make it uh make the colours with LEDs uh beneath the the buttons . If you press a button and you can disable the the colour LEDs for for people that don't like it . And this is , this is with the curved that I mean . Well we could make a compromise between that . Uh instead of doubly curved we take a single curved . So to appeal a little more to the all the public . Yeah so we keep it singly c single curved then ? I would go for the double curved . I mean our aim is to make something different right ? And I I'm I'm thinking uh you know uh a drawing palette , where you have the shape for your thumb . but if you if you make it more curved we we can make more and more options for buttons . You can make a trigger button or something like that . and we need something that well that that you can able to use in one hand I think . But from the side you you can have it also in a kind of shape . A little upwards . So that the screen is more So then you have double double curved in some way . How about we do a uh a pop-up screen , like the laptop . If you can uh flip . But I dunno if that's too expensive . Okay so the buttons are on top here , and you flip it over that way . and you can maybe even drop the menu button because maybe if you flip it open it will auto activate amauto uh uh automatically . So okay b but you have t you need some button to flip this open . Well yeah the the idea of it was , is that because you close it , you cover the L\_C\_D\_ screen and it won't be vulnerable to scratches or whatever . We just have to make sure that the closing mechanism won't break . or do we wanna make its shape look like a banana or something ? I think that uh it's a nice design . Yeah so okay we should better choose one sh one shape . So the keywords are primary co colours , spongey ? And ergonomical shape . Yeah . I would give it a female shape I don't know what what colours should the basic print be like ? Like some soft green or something ? Orange or something .

and then and then very bright , uh a yellow banana , an orange , uh a green apple , stuff like that , Yeah w we need very primary colours , like bright red , bright yellow . Yeah but the primary colours w we can uh create with the with the LEDs on the on the remote control . If you make it uh just a yeah bl give it a blue colour , then it's just a neutral colour , That doesn't really work . To draw , I guess . So that's that's a dark blue basic colour I guess . Yeah with some some yellow banana So it not not only in in the colours of the LEDs , that we want something to keep it visible at all times , 'cause I remember from one of our first meetings that uh people lose their uh remote controls often . I mean , the the colour of the background of the display ? So just just a a blue blue backlight or something like that . maybe a maybe a white a white backlight ? But don't we wanna make the background the the bright colo colours ? So th the total of the thing is very bright ? But then then again , which colour should the buttons be ? But maybe the buttons , all buttons in red is maybe a bad contrast for colourblind people . Red and green are actually the b the easiest to discriminate . Even for colourblind . So red buttons are okay ? You better bet better better keep the LED and the button itself in the same colour I guess . what we should do I think is is make kind of a see-through plastic button , with uh one coloured LED behind it . but uh basically you two are going to work on the smartboard . Next thirty minutes to design something so You will do the evaluation . You probably get a mail . Yeah but maybe you can do the evaluation you don't have to evaluate yet but you can make a procedure which to follow . So we're gonna work here ? On this sketchboard ? But we have to do it at this moment , after th this meeting ? Yeah you have uh thirty minutes .

## Complete Meeting Transcript

Hello. Yes, I made it. English from now on. Drawing or Yeah. Ooh it works. Spicy. Where are all the other presentations? The conceptual or Ah. Because I see only my own presentation yeah. This? I'll just put it in there. Or not. Ah, I can't cut and paste it into the other folder but Move to meeting room. Yeah. Yeah me too,. Yeah. Yes. Me first again or yeah. Alright. Did you open it already or no. Ah. Ah. Yes. So welcome to the marketing presentation once again. Um this time about trendwatching. Uh well there has been inv investigation again, in the in the remote control market. Uh it shows a number of developments. Uh I will address them uh in a moment. Um fashion watch watchers uh have detected the trends for young public, because that's our public. Um well fruit and vegetables will be will be the most important theme for clothing, uh shoes and furniture. And the feel of the material is expected to be spongey. So um the developments I will address them oh yeah well this is the fruit and vegetables looks of fresh bright colours. So to give you an idea. Um well the developments? Uh development one. Uh well most important aspect for remote control happens to be a fancy look-and-feel. Instead of the current uh functional look-and-feel. Um well fancy stands for an original look-and-feel of the case and the interface. And the second most important aspect is that a remote control should be technological uh innovative. Um well it stands for the use of technical features that do not exist in current remote controls. I think we pretty much covered that with our screen and um and speech recognition, so I don't expect that to be a problem. And the third development um is that the remote control should be easy to use. Um Well the first aspect uh was twice as important as the second aspect, w which was twice as important as the third aspect. So um that kind of gets you this ratios. So fancy look-and-feel uh is the

most important uh point of attention. Uh so the fruits and vegetables in combination with the spongey material. Um well technolog technological innovation, we've covered that pretty much I guess. Um and easy to use, I don't think that will be problem. So my point of attention is especially this part. That this will be a crux. So that was the marketing uh presentation. I had only one document left. So kind of this So a k a small example. Kind of this this look. Uh nothing about the buttons but just sponge kind of thing, and and some fruit and colours I dunno. Just made a quick design. Alright. Yeah. It's okay. F\_ five. Yeah. Wi an indoors. Oh. Yeah. Yeah. Yeah. Yeah. Yeah. I guess we can only choose one. Yeah. And it's more fun. Yeah, just playing with it and especially when the material's rubber. It can be done, I mean, you can't harm it, so it's a perfect combination I guess. Yeah. So So double curved is like this, this, this, or Mm. Yeah. Also in in height? Yeah okay. Yeah with the programme. And and the and the buttons that you need to control it, I guess. Yeah. Back and okay. No. Rubber material. So that's uh is that is that the advanced chip? Wow. Yeah. Alright. Kinetic. Double curved.. The cost of making it should be twelve and a half? Yeah, so it's cheap. Um well the interface type supplements. If you go to your homepage or something, you should get your own information. I got my fresh and fyoo fruity uh picture uh also uh over there, so No. Too less time. Yeah, also the menu. Yeah that that w Yeah. Yeah I was thinking of that also, with with a with a uh arrow. So that indicates that there's an menu under that menu. So Oh yeah. Yeah. Mm. Yeah. Cool. S underwater uh yeah. Yeah. Yeah.. Yeah. Also a kind of rubber uh Yeah. That should be nice. So s Yeah there's only in in this dimension. Like this. So curvy or not. Yeah so we keep it singly c single curved then? Yeah. Yeah. Yeah. So from top view it looks kinda like this. But from the side you you can have it also in a kind of shape. Maybe because the the screen is on top

you can have Maybe you can c have this kind of shape. A little upwards. So that the screen is more towards yourself, so you can easily see your screen. Well well you have it in your hand so it's a kind of an angle from your eyes to the screen. So then you have double double curved in some way. So this this is so the screen is positioned over here. Oh. Something like that. And the buttons are more, well it's very thick now but That's uh that's Yeah? That that you can press it and then it comes up? Or But then the side view can be straight. If you have a pop-up screen. But I dunno if that's too expensive. I mean maybe it's too much Oh the advanced buttons. Right. Yeah. Yeah. Yeah. Yeah. Yeah. So okay b but you have t you need some button to flip this open. Yeah. Yeah and it says menu and it flips open and then you have the buttons to control it, in combination with your True. It uh c it can go open. An adv an adv and it will be covered in some kind of uh thin rubber layer or something like that. Yeah, uh It's very no it's very strong. Yeah. Yeah the lower part doesn't work I guess, so maybe you should try it over there. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah but but that's optional for later I guess. I mean, we have to make Yeah we we better so choose one Yeah so okay we should better choose one sh one shape. But that's the kind of the idea, so it lays good in the hand, and then on on the side with with your thumb, you you can you can use, yeah, you can use the button option Spongey. Spongey can be reached by means of Yeah. And and the and the control thngs in the middle? The the the arrows? Yeah and then numbers. Yeah. Alright. Uh pretty nice design. Yeah. Yeah it looks uh pretty fancy.. Uh bananas wierd shape and other fruits also, so it's better to have um some sort of basic print and then a fruit print in some primary uh colours. I don't know what what colours should the basic print be like? Like some soft green or something? Or and then Oh yeah yeah, dark blue and then and then very bright, uh a yellow banana, an orange, uh a green apple, stuff like that, with very uh bright tones I guess. So you have something like Yeah. Mm. That doesn't really work. To draw, I guess. Oh. What's this? Right. Hm. Yeah. Two hours further. thickness. Oh. Oh. Wh why not go for the twenty? Yeah. That's what I call

painting. So that's that's a dark blue basic colour I guess. It's pretty nice. And then uh Oh Yeah with some some yellow banana Like. Yeah? How do you mean? Some some Yeah an orange. Well alright well this is more like purple I guess, but it's should be more real dark blue, so the contrast with the with the fruit objects is uh pretty high. So uh yeah. That would be a nice uh nice device I guess. I mean, the the colour of the background of the display? Ah well I don't guess it s has to be a sixty uh sixty six five thousand uh colour, so yeah too expensive. So just just a a blue blue backlight or something like that. Green is too old-fashioned. But blue, blue's okay. J White backlight, and dark. Yeah. Whatever which is visible. I know you sh you should test it under uh under a light conditions. I mean it's hard to tell uh I dunno. Yeah. True. Which which uh colour should the buttons be? Why adjustable? No uh But maybe I mean they have to they have to have some colour right? And if the background is very dark blue Yeah? So more like Doesn't work very well. Uh. More like this colour. And then then yellow and orange and red objects on it or something. But then then again, which colour should the buttons be? The the press buttons. Should they be white or black or Uh Yeah but it's pretty fresh, on the other side. Yeah. My couch is in that colour. Yeah. Well it works pretty well. And then time was up. Uh. That you have five minutes left or So something like this. That should be pretty nice colour. But maybe the buttons, all buttons in red is maybe a bad contrast for colourblind people. Because the of the green. Yeah. Yeah? Yeah. Okay. So red but

tons are okay? How do you mean? Yeah. No that's that's too busy I guess. You better bet better better keep the LED and the button itself in the same colour I guess. So just an extra bit of light and attention. Yeah. Yeah. Alright. Of the product? Which we don't have yet. So wh how should I do that? Oh okay. Or you you or you send it to me. Or just because you are going to design it on this board right? Yeah. I I probably get instruction on that, how to do that, so I make another presentation I guess. I kn I know what's gonna happen in in yeah so I've a basic idea. Yeah. Yeah. Alright so that's uh Yeah. Yeah. Yeah.. Yeah. On the left. S so, yeah. Yeah. This? Uh pretty accurate. Oh we skip this I guess. Sound button press. Light only button user ca user interaction. Yeah. Yeah. So the pl the plastic plastic buttons also help uh because of um they are only lit during interaction. So Well it's a good thing that the buttons aren't um, well that they are plastic, because then you can light up the light on when when they are usable. Maybe you should draw it very large like this. Oh right. Erase? Yeah. Much easier, yeah. I don't see a sign that the meeting is over yet but Yeah. Oh. Wrong one. Alright. But we we I is it if this is from the side woah. Steady. Because there the screen goes up like that right? So then it's like this, or that's not convenient because then you have the screen like this and look like the it's better to have it somewhat like this. Or does it flip all the way? It's better to to have this like this I guess, and then flip it like this. Yeah. So w yeah. But we still keep the flipping mechanism. Yeah. Yeah but maybe Yeah but maybe we we should then Yeah there the middle Sh sh shouldn't we integrate it? And then like i oh th doh. Come on. So this is the shape. Oh. It hasn't Okay but the screen is a bit lower because if it falls on the other side, it doesn't fall on the screen. So there's a layer of rubber on the side. So no flipping but just no. Throwing and the kinetics. Oh. We better make we better make it like this. Eventually. Yeah. Uh they are responsible enough to have a mobile phone, so also to to deal with their uh remote uh control. Yes. Yeah? Ooh. Yeah. Alright. Good. Yeah. We should work in our own room right? Or not? Yeah. Yes. See you two in half an hour uh Okay. I I've got the same problem as well. Oh. No. Yeah. No problem Yeah. No. I I don't mi I don't mind. That's Do you want to go first? Okay. Yeah. Yeah. It's better than than my uh drawing. Yeah okay but I have to design the Yeah. Yeah. Yeah. Pushbuttons. Yeah. Yeah. Yeah. As an optional uh feature. Or combine uh both with a with one uh Okay. And throw it. Okay. Yeah. Yeah. One one uh very important thing I was uh yeah thinking about is the speech uh

option. We were going to use that. Yeah. So um Yeah um yeah that's one thing uh which I'm not sure uh of how to implement it uh into the remote control. No okay but it has to be combined with with the menu uh for functions and So okay. Yeah. Okay. But do uh j do we uh do the speech just for the basic options, for the simple buttons? For for everything, also for the advanced options? Okay. Uh we have this very uh basic uh trendy design. Everybody says it so that's what's uh yeah um Yeah in the in the last uh meeting we uh we were yeah putting the the simple and the advanced options separated. That's yeah obvious. Um yeah. Pressing the the menu option uh will disable uh all other options on your uh remote control. And only the the L\_C\_D\_ panel will uh light up and then you can only uh change the yeah the options. Yeah. Um yeah design has to be very attractive but that's your your op your yeah. you have to uh delete this but this is the the the simple uh layout. Uh display on the upper side with the the menu button and maybe a some sort of cancel button or save button. I'm The back. Back and okay yeah. Uh What? A little bit I think but not not everything w Okay. Oh I uh didn't read that. But But this

is the the basic uh design uh for the for the m yeah for the buttons. Um I wanted to to categorise everything. Uh with a speech display uh yeah, sound, everything you you noted in your uh minutes. Um every pushbutton has uh has its own uh LED light. So you can uh yeah change uh m make it more trendy for for younger people. And uh if there are older people they wanted more uh yeah more uh luxurious so that's an a also an option. Um that was it. Yeah. Yeah.. We're going to produce it in uh China so it's no problem. Uh it's it's quite difficult because we we haven't got all the options uh yeah. Yeah. This is the the menu I was uh looking uh at. Yeah. Arrow yeah. Yeah. S yeah. Yeah. But it has also to it it has also to be uh luxurious uh for for yeah rich people. Th this looks a little bit like like for only for children. So Yeah. The colour Yeah. Okay but the the colours, you you can make it uh make the colours with LEDs uh beneath the the buttons. If you press a button and you can disable the the colour LEDs for for people that don't like it. Yeah. Yeah. Yeah. Very cheap uh cheap look. Yeah but if you if you make it more curved we we can make more and more options for buttons. If you have uh it have it in your hand, you you you are not only um yeah you don't need one dimension but you can use other dimensions for pressing the the buttons. Yeah. Something to shoot at your television Yeah. That's yeah. Okay. Yeah. That's the the more advanced options were uh for the for the menu. But you you want okay. You just want to hide them all? The oh. Yeah yeah yeah. That's but it's it's not it's not very uh very strong uh yeah if you drop it one time. Okay. But when you are left-handed, that's that's a problem. But that's that's very expensive uh Yeah. We we could make some some rubber uh some rubber uh yeah mouse, with which you can change uh and so if you Yeah. Okay. Some yeah. No no no no. Okay.. Yeah. No the arrow's over here. Yeah. Or blue? Dark blue or Yeah. Yeah but the primary colours w we can uh create with the with the LEDs on the on the remote control. If you we uh yeah. If you make it uh just a yeah bl give it a blue colour, then it's just a neutral colour, also for the for the more uh yeah for the people. So that's So that's blue. Mm. Yeah. Yeah. Maybe a Yeah. And which which colour should uh should I give the the display? Uh Or Yeah. Yeah. Yeah. Mm. Yeah. Yeah maybe a maybe a white a white backlight? Dark uh letters, yeah. Yeah. Yeah. That's adjustable. Yeah? Or not. That's how we are going to make it uh more trendy. Or is it uh too expensive? Mm. And it it looks quite cheap, that colour I think. It's it's not Yeah. I dunno. It's it's trendy okay. But Mm. Yeah. Yeah. But the but the buttons have their own LEDs or not? Okay. Okay. That that's a default uh setting. The the red buttons. Okay. Yeah I I was think about a red uh red LEDs and blue LEDs and Yeah. Yeah. Okay. Okay. Yeah. Yeah. But we have to do it at this moment, after th this meeting? Okay. Yeah. Ah so this is basically the what what we are thinking about? Yeah I let's just uh delete all these uh or Oh, next. Okay. Uh Yeah. And then after that we can make the user uh inter interface. Yeah. Yep. Oh no it's it's okay.

Yeah. Yeah. Yeah but this part isn't uh functioning properly. It's a bit uh large.. L let's make first the the all the views. The the front view, side view and the back view. Yeah. The middle has to be very small so you can have it in your hand. Yeah the display, we yeah we can put a display. Yeah. The the arrow functions. Yeah. Yeah. No it's it's uh it's okay. You can make it m larger. Maybe it's easier to to draw uh Yeah that's that's the basic idea. Yeah. Yeah only if you are going to put buttons on the side of the unit. That's the question. Yeah. From the Yeah I'm I'm May maybe it's it's easier to to integrate the the the L\_C\_D\_ screen just into this this bubble. Because it do doesn't have to flip then. Because we have en enough space for for making

a an L\_C\_D. Because here But why why do we need uh the flipping uh Okay. Yeah. Yeah. Yeah. Uh the the shape is okay but yeah? I don't see the the yeah why why we should use the the flipping uh mechanism. Because we Okay yeah. It's it's for for for more trendy uh Because we have enough space. H here we got uh the basic functions, the the arrow uh yeah button. Yeah and then h we sh mm. Yeah, then it's No flipping or you wanted the flipping so But if you if you If you drop it it it just breaks. And it has to be very strong because of the. Yeah kind of And it's also for the for the children, it's yeah for people not sixteen years. But there are more Yeah okay. That's true. Okay. Yeah? Okay wi Yeah. The Real Remote. I think uh it's the sensors. Okay. Yep. Okay that's the side. Ah it's it's okay. But do we want uh options on the on the side with the with the buttons? Or just leave it? Uh could make an uh a volume button uh scroll, volume button. For menu. Or Yeah. No, yeah. Yeah. Mm. Yeah you are going to design it so .. Yeah just testing. Mm? English.. Break is over. Whoo. Spicy. So, he's coming. Oh okay. Ah. She. You can look at the final report, 'cause I have to record everything we are deciding and such, so I'm trying to write it down between everything else. Oh. Yeah. Here we go again. Welcome. Uh we have again three presentations and then we have to decide on what concepts the mobile phone has to uh f the remote control has to support. So who wants go. Yes? Yeah sure. Doesn't matter. No. Mm-hmm.. Yeah yeah sure. No. Cool. Yeah you're just the user interface hmm? Yeah layout. Yeah okay. You probably opened it. F\_ five. Yeah. Yeah okay. Calculator's can do it. Mm-hmm. Yeah. Uh I think you can only fit one uh source of energy on the Yeah I didn't receive any info uh. Yeah. S yeah it's safe. 'Kay next. Uh Okay. Can we uh Yeah. Well the visual representation is not there with speech but you can Yeah. Just yeah. I think you can just uh match the speech commands with the functions that are already present. So I don't think you have to design anything else for that. Both. Yeah. Yeah. Yeah. That would be the back. Back and okay. You did read the minutes I wrote? You did read the minutes I wrote? Oh okay 'cause I pretty much summed up all the buttons there were. So I hate doing work for nothing. Mm-hmm. That was it? Okay. Uh again. Ugh. Okay so what we have to decide is what kind of components do we use? Uh energy source, chip type, case type. And user interface. But I didn't see a clear distinction between these so I think what we have is okay. So we only, we already decided that kinetic would be the choice for energy. Uh the case would be doubly curved. So Rubber material. And that's the only thing we have left. Oh okay. No it's easy. Advanced chip. Okay. Too. Uh I didn't get any info on this. So Yeah. I have total here. Yeah I don't know. I didn't get any information about that so Yeah. Who doesn't. Uh let's see. Is there a new thing? Yeah the interface, maybe can Ooh. No. Uh do you have a picture of doubly curved case? And could you put that in the group folder? Of the project folder. Ah you didn't draw it yourself. Ah. Arrow. Yeah.. 'S the target group. Yeah sure. Yeah. Oh okay. I see. Yeah also like this. So you can hold it.. The children's story. Yeah I've got it. Distinction. Yeah. Mm-hmm. Mm-hmm. Different. Mm-hmm. Camera. Yeah submarine. Well Yeah but this this the is for the. Okay. Uh Ah yeah bright colours. That's singly curved. Okay. Well we could make a compromise between that. But I don't know if it's worth the effort. Uh instead of doubly curved we take a single

curved. So to appeal a little more to the all the public. Mm-hmm. Yeah. Also. Yeah that would be an option. I don't know what you think. Mm-hmm. Okay. Yeah I'd agree. Mm-hmm. Mm-hmm. Mm-hmm. Different. Stands out. Or Oh yeah a one hand uh solution. can turn it maybe. To switch from buttons to interface hmm. If you turn it a little.. Oh yeah. Least you can easily

see it. If you can uh flip. Uh so you have a the the side view. So and you want to be able to make this. Okay so the buttons are on top here, and you flip it over that way. Yeah. Oh yeah. Yeah yeah yeah yeah. Right. Yeah that's good idea. Yeah. No not all because you need most of them, the arrow buttons. But you can hide the okay and the back uh button. And the menu button also because when you flip it open and you can maybe even drop the menu button because maybe if you flip it open it will auto activate amauto uh uh automatically. Why? You could just make it mechanical. If you cover it with rubber. Mm. Yeah. So it can bounce. Yeah okay so that that may work. Okay but then we still have the the the thing of the the the shape. Yeah. What kind of Harder.. Maybe can design two versions. Mm-hmm. And ergonomical shape. Yeah. The female shape yeah. With two uh Oh yeah. Some uh k esk uh yeah. Yeah. Yeah yeah. Yeah. So the keywords are primary co colours, spongey? Yeah. Yeah. Buttons. Okay. I think that uh it's a nice design. It's cool. Yeah. Yeah that's Orange or something. Mm. Yeah. Huh cool. No it's. Yeah it's text. N no you have to exit. You could also make line with uh Yeah. Mm. Yeah. Y Yeah and then on top of that. Some yellow. Banana colour. Yeah if you if flashing colour so you can't lose it, basically. Well I think it's a bit too much but Yeah. Yeah. Who? And then you can use yellow or smething. Why not? Aye. Like this. Colourblind yeah. No so that's mostly red and green I believe. Woah. All all buttons? Okay. It's difficult. Blue. Maybe green. Yeah you can Mm-hmm flashy. Mm bzz. Red maybe. Black. Why? Yeah. So Ooh.. Uh not yet. Yeah within five minutes yeah. Y left yeah left and then uh I have to kick you out. Yeah yeah. They have LEDs but they have a colour. You can make them red. Yeah. But I think you need to keep in mind that the LEDs are just extra light. Uh they they don't determine the colour that much, I think. 'Cause you have to print on them you have a background. Each number is transparent. Uh partly but you have to print on the number. Or the the sign. So you can't change the colour so Yeah. Bit of light. Bit of feedback. Yeah. Yeah. Mm-hmm. Mm-hmm. Okay with Uh Don't mean to discourage you but uh basically you two are going to work on the smartboard. Next thirty minutes to design something so And the You will do the evaluation. Yeah. Yeah uh about Yeah I don't know. You probably get a mail. Yeah. Once they are finished. Yeah. Yeah but maybe you can do the evaluation you don't have to evaluate yet but you can make a procedure which to follow. I don't know. Yeah. Yeah. About. Yeah. You have the basic idea. And you two uh are going to do this. Look-and-feel and Yeah. Good luck. So I uh make new page and uh be creative. Yeah you have uh thirty minutes. Then we have to uh see something which we can uh show to the management. I would yeah. Yeah. Next. Oh and save this uh board. Just save it. Yeah okay but just press save and uh It'll be fine. You can also include clip-art. So if you'll rather draw in paint or something then look. Yeah. Yeah. You can also include it. It's not much work. That's included. Yeah okay. Yeah. Sensitive. I dunno. Maybe just start typing. You also do the other sides. Not only on the front si uh the top side but also the the side view. Uh. Jesus. What do I write down? Why can't I work here? This is much easier. Yeah. Mm. No so I just work here a few minutes. Five minutes left before the meeting ends. Yeah we keep the flip? Keep the flip live. No flipping? It's shaking. Yeah just light on top. Safer. Mm. Yeah okay that the target group. Well. I just uh ended the meeting. You two go design. Oh. By the way. Um I uh thought up a name for our product. Yeah. It's called uh the Real Remote. With a copyright sign after Real. So maybe you can include that somewhere. Yeah. I don't see any power cables here so 'Kay. Good luck. . Just kidding. So annoying. I just put it in the in the shared folder so it

should be yeah I think so. Yeah, conceptual design. What or whatever does it No no no, can you go back one? Uh 'cause it has to be PowerPoint pre yeah components design, that's it.. I did get a bit more done than the last time, 'cause I knew that I didn't have time so I just copy and paste everything into the Sometimes I have these pop-ups or these sounds and there's nothing there, and also with I don't know how to use PowerPoint, so it takes me forever to get something done with it. Yeah. Thi Mm-hmm. Who wants to start? Sound. Yeah yeah uh uh. Yeah. And shall I go first? So I Yeah? Alright. Uh components. Oh no. Yeah true. Um Alright. So I'm dealing with the components design. Um let's see. I uh used some design examples we had uh from similar products. And I used uh possibilities from our manufacturing department about current components which will have to be implemented in the design. That's why I had to, wanted to go first. Well they gave me um an idea about what people want. We're f mainly focusing on this group, but I want to make the distinction clear. Uh I could not drag the pictures into the the slides so s so I don't have examples of how it looks like. But it comes down to what you uh what you think we should do with the spongey and the fruity looking uh type. If you, the young dynamic people want soft primary colours uh, which looks like fruits you know, you can and shapes that are curved and not uh solid straight lines anymore. So this basically um yeah goes on to what you were mentioning earlier. There is a lot of um factors involved in choosing the components. There's a lot of options that we have to discuss. Uh for example the energy source. we have four types. The basic battery. Uh we have a hand dynamo, which we yeah we Dutch refer to it as the kneipgatt. Uh the kinetic provision of energy which means if you move the thing, if you shake it. Which will be fun for toddlers right, if they wanna use the And uh of course solar cells. But I dunno how we would use that into the design of the actual product. So uh my yeah also also in you know countries where there's n isn't much light like in Scandinavia, they wouldn't be y able to use it half of the year you know. So that's not cool either. So um for the uh a case, there's uh the traditional uncurved flat hard case. Single curved, which means that it has uh curves in one dimension. Or the double curved. Um I wasn't able to finish my uh personal preferences sheet, but well you know that we will have to go for the double curved 'cause it's daring and different from what we have now. Uh the case materials. Well we have all kinds of hard uh materials like the the hard plastic, the wood and the titanium. I would definitely go for rubber 'cause it fits most in what people wanna see nowadays. Um poo, this is a lot of text. I wasn't able to organise this yet. We have yeah several uh interface designs. Uh we can use a scroll buttons for the menus, but we already kind of decided to go for the f for the pushbuttons, for the the arrow buttons. So that's not really interesting. Electronics? Yeah, maybe we wanna decide on what electronics to use the advanced chip I think is easiest to implement uh for the production, 'cause they they can print it better. Um Yeah. I think this is about it. Yeah I was working on some per personal preferences. I first uh chose for the battery, 'cause yeah I'm traditional and that's the most obvious, easiest choice to go to. But I really think that we should maybe uh think about the kinetic energy, where you have to move the thing to be able to use it. Yeah maybe we I can imagine that the kinetic uh type energy source would be more expensive to make. But it is more longlasting, that the people don't have to ever buy batteries again. And it's also more fun yeah. I always chuck my uh remote control around, so Yeah y exactly. You don't have to be scared about bouncing it off the g floor and breaking it or whatever. So that's the end of it. Uh go ahead.

No it means curved in two dimensions. So uh w single curved? Uh let's say would be a b square box, but then with curves on one dimension. And double curved would means that it would have curves curves in every direction. Like three D\_. Yeah. Design? I And rubber. Rubber material. Yeah we need the the chip on print to be able to support the the screen and uh and f audio function. Yeah. Yeah. Otherwise you would have a simple chip, just for pressing buttons. But we need more. I'm just thinking,

this is not my department, but I I'm not sure what this is gonna cost, to be able to m So 'cause we need to sell it for twenty five Euro a piece. That's gonna be difficult huh? Yeah. Yeah yeah yeah. Child labour man, we love it. Um let me see. Wait a sec. Yeah I'm going there now. Inspiration. Well Um yeah maybe it's Maybe it's easier Yeah. Yeah perfect. Maybe it's easier if you guys come over here. S see this is the the the standard traditional type, where the form uh yeah serves the function, you know. It's like really basic. But this m is more appealing to old people and we don't want that. This is what we're looking for. And th that means curved in both dire dire uh dimensions. Not only like this but it has to be exactly. It has to be kind of instead of the PlayStation, the module. It has to be like the the Game Cube, you know, where your thumbs would be laying in the instrument and it has to be nice to hold. And It ha Yeah but that's that's the the problem uh yeah the dilemma actually, 'cause we wanna appeal to the to the young public with fancy with flashy colours, and with a lot of shape. And Yeah, and the and the rubber, it it will look cheap always, you know, with the There is mobile phones, in which you can change the colour also of the lights. Maybe we should consider this function. To customise it and so I mean kids can make it look more flashy with different kinds of colours and people who want something, you know, different, or more uh design, they can go for one colour like uh for example this uh photo th camera. Personally I think it's really ugly. Just give me the thing that it's inside there maybe I'm too old for this stuff. Yeah. So those I think are all my oh. And this is, this is with the curved that I mean. Yeah. Yeah? A compromise between what? This, this would be uh single curved uh? Yeah. Yeah. Exactly. Exactly. I think the I mean our aim is to make something different right? To make something new. I would go for the double curved. And I I'm I'm thinking uh you know uh a drawing palette, where you have the shape for your thumb. So it kind of holds nicely, something like that. Well this is really your decision but Yeah. As well. You can make a trigger button or something like that. Yeah or that that is the confirmation button or something, that you scroll with your thumb, with the arrows, and then confirm. That would be a nice way to use it but I mean, yeah, I'm thinking big already, and we need something that well that that you can able to use in one hand I think. Yeah.. How about Mm-hmm. Yeah I understand what you mean. How about we do a uh a pop-up screen, like the laptop. So that the only the simple functions will be visible at first. And then if you want Yeah. Something like that. Yeah. No uh like I would draw it like this. Let's say this is the side view. That you have a a screen that will come up here, and can go down that way. If you know what I mean. So that it would come up like that. Yeah or preferably even keep the simple buttons here, and then under the screen even you could put more more advanced buttons. F for the L\_C\_D\_ menu right? So w w Oh Activate and th the yeah. True. True. But you can make a, yeah, you can make a trigger here. You know a simple uh with a Yeah. Exactly. Well yeah the the idea of it was, is that because you close it, you cover the L\_C\_D\_ screen and it won't be vulnerable to scratches or whatever. And Exactly. Exactly. We just have to make sure that the closing mechanism won't br

eak. Th it's very solid yeah. That actually will offer some extra protection for the Yeah. Yeah I was thinking, if if you have your hand, it this is your th Okay. If this is your thumb, and this is your hand like that. With your uh wrist. That you, that it would be kind of shape like this, you know. So it's easier to hold in your hand, to y f Uh yeah. Yeah of course. Yeah then w then you would have to to make it like this. Like like you drew here. And maybe th then make this thicker also than the centre. Give it I would give it a female shape but uh yeah. Anyway. Obviously. Make it more appealing to guys. I mean Yeah but we have hardware inside, which is so it has to have some sort of basic shape. And also the screen, you cannot mould it. You know kind of thing. Yeah. And then you can You can place the screen here, which can come. And but then I w I would I would do the arrows here, kind of thing. Those buttons? And the simple buttons here, so that I Uh y eah that's what I mean. The arrows over here, and here the

s simple uh or do we wanna make its shape look like a banana or something? I dunno. Yeah. Yeah we could make We should use Yeah w we need very primary colours, like bright red, bright yellow. Yeah. Yeah okay yeah. And how about some uh some flashing standby lights? Like you have on the Samsung, well I don't like to call brands phones, the you know that 'cause I remember from one of our first meetings that uh people lose their uh remote controls often. So it not not only in in the colours of the LEDs, that we want something to keep it visible at all times, or Um Yeah. Exactly. Yeah. Yeah. As long as you loo use uh high contrast between the the background and the foreground colour. So that people with uh with And also for people who are a bit colourblind. But don't we wanna make the background the the bright colo colours? So th the total of the thing is very bright? Like the pictures I showed you guys. Those things were all like like bright red, bright red, flashy. Yeah something like that, something that stands out more. Yeah. The green? It's actually a pretty trendy colour at the moment. Do you get a pop-up if we Alright. No that's actu Red and green are actually the b the easiest to discriminate. Even for colourblind. They will see one of each as grey. But if you use uh green on blue, those kind of colours will look the same. I think. I think so. You can what we should do I think is is make kind of a see-through plastic button, with uh one coloured LED behind it. So that the whole button will shine as the colour the And if you think about easy to use buttons, we have to, well we have to make it the shape so that it's easy to hold f for both hands, but also that you can reach the buttons with your thumb, if you hold the machine. Ah, right. So we're gonna work here? On this sketchboard? Alright. Thanks. Alright. Thirty minutes. Alright. Yeah. Shall we uh make a new uh Yeah, I just make a new one. Alright. Huh? Yeah I'll just I'll just keep it there. Yeah. Uh sorry. Okay. Current colour? So um Shall we make some outline sketches of the basic shape first? Because I I Yeah 'cause I have to uh focus on the on the basic look-and-feel design. So how it's gonna look. And you have to think uh how we're gonna put the screen in it and those kind of things. So if I'm drawing and you think okay I'm not gonna be able to put a screen in there, you have to correct. Uh do you mind if I draw in black then? For normal sketches. so we kind of want the girlish figure. I'm not so good at drawing. Excuse me? No uh uh. How do we uh uh or insert text? Oh that's a bit big. Yeah. Yeah. Ex exactly. Uh Uh I thought for the side view, that the w the basic section would be rather uh a bit thicker than the middle, where you're holding it with your 'cause your fingers have to fit underneath and Exactly but the uh but the upper side has to be a bit more like that I think. Uh don't you think? So the display we will put in here, the basic uh functions i

n here, where it's most reachable. The The th Exactly. Oh. This is hard. What do don't have to draw it exactly do we? Wait. Let me try it one more time. Maybe I've uh it's easier if I draw it in once. Okay, of course it will become way more ugly. Yeah. This'll take forever. It's fun to work with this pen. Um so, larger. And yeah. So side. 'Kay. Um other views? Uh Yeah. Let's fill i fill in the buttons later. So this is gonna be from the uh from yeah yeah. Sorry. Yeah. Yeah? The the idea is that it has to flip up to here. Okay. Yeah. Yeah yeah yeah. True. you can adjust the angle to which it flips. So it can also from this angle, it can flip all the way up to there. You can flip it up to there if you want. Think so. Yeah because I think it will feel weird if you would make this smaller and this bigger or something that I dunno. I thought it would be cool.. It doesn't aim so well. Yeah yeah yeah. Definitely. Yeah I guess but uh I mean most votes count right? Yeah. Yeah true true. Yeah. Yeah if you if you're going for the kinetics Yeah. I'm just thinking totally different designs also. Remember that the weird pocketphone thingy which looked like kind of a Gameboy. Maybe we should try something like that. But yeah. Oh right. Alright. Yeah. I like it. Okay. This can go. Oh yeah we have to f uh include that in our design as well. Let's see. What the hell's that? Uh Yeah. I think we do. Yeah or j or also scrolling for the m yeah. Yeah? I dunno. We w kind of

wanted to stick with the Yeah I'm just thinking, if we i we wanna make something different right? So the with the scroll is is more futuristic than the standard arrow buttons. I think.

# Meeting ID: 0

Data Source: Train

## Executive Summary

like before we uh I have to redo the meetings from n th the minutes from the last meeting It should have nine channel buttons , a next button , volume buttons , subtitle buttons , switch to control features , colour contrast , sharpness etcetera . Uh speech recognition is one of her very f favourite personal uh features she would like see d d to be integrated in this um in this new remote . The industrial designer um presented her uh thoughts on the issue . She would like a special case made out of plastic that is very strong , not using any harmful materials , should be recyclable and should be colourful . uh scrolling method is more expensive and not that practical anymore . The marketing expert uh who has to finally come up with to to to market this product has been watching the competition , has done some research on the internet and also has used h her personal observations to come up with the fact that such a remote sh should be small , easy to use and it should be eye catching . And the decision that we took last time was that uh the special feature we would like to see is a speech recogniser , should be trendy design , compact and strong , This is a model of the remote control which we are going to build . Uh this is us in a snail shape so uh it is attractive it's blue in colour Uh and also compact in shape . Um the material is plastic and uh for the buttons it is uh s soft rubber Now we have included another feature that is the mute button Now uh we have included the switch on and off button . Then we have included one to nine buttons We have also included two buttons for increasing or decreasing the volume . Now our our model also contains a button which is called as the menu button . We have also included a button which is called as the swapping button . And then um uh for the for the led , for the light emitting diode it is a fluorescent green And at the end , it this remote has inbuilt voice recogniser which c which will recognise the user's voice and then it'll act accordingly . what I really like a lot about it is that you can reach the whole thing with one thumb , I like the idea that the on-off button is in a really prominent place . The colour's very attractive . Yes , it will have uh these buttons will have the numbers and all the rest of the buttons will have symbols . and one more feature is we we have a holder for this remote which is an oyster shape . A shell shape . I think voice recognition is our big selling point I think we have to , we have to dwell on on on the appearance . I'm supposed to make a little presentation , aren't I ? No , now this was our evaluation criteria which we uh just have done . Ah , but in my instructions I think it said I was supposed to go to the board and do something . Well , there is a production evaluation . But that's after the financing . Okay now on the financing we bring up the Um kinetic source so

that's in the energy source that's all we need . Uh electronics , simple chip on print ? I guess it's double curved . And then we have to interface push buttons . Eight , eight point two . looks like we are well within budget . Now we would like to have a presentation by the marketing expert on production evaluation . And I think we should show this prototype to people from various age and socio-economic groups And show the the prototype to consumer research groups , Okay , now the things that I was thinking and th my wish list has really been realised in this prototype . And functionality I put last on my list because people aren't going to use it before they buy it . Okay , so um the shape um I think is a a one . And our colour I think is great . so I would say that we got to a five out of seven on on functionality . Um I just realised one thing . In the financing there was no room for our voice recogniser . I mean maximum we have another four point three euros I mean four thirty . So we're just gonna have to settle for whatever quality that will buy us . Um and we're supposed to talk about those things as a team now , uh one being good and seven being the worst . Yes I think uh shape is one . And how about on size ? I think I would give it at least a two . Colour , I gave it a one . One , one , one , okay . And how about the feel ? I'll give three . Uh maybe two , And the next is functionality I'll give it a three . It looks like we've got got ourselves a pretty good product . Here is what we looking at uh satisfaction on for example room for creativity . Is there more room for creativity or are we absolutely happy ? We can always improve , yes . so I think I I mean we can just have small buttons and more buttons in that case . If we want to have more features than that . Well then again if we're gonna um do the speech recognition thing we're gon there gonna be some buttons that are gonna have to be added for that for the recording of the the speech . maybe we can eliminate one of the mute buttons , instead of having two mute buttons . Uh , um are we happy with the creativity that has passed here personally I think uh I'm pretty happy . and then the next question is are we happy with the leadership of this project ? I think you've done a good job , Miss leader . Yeah I d I do too I think we worked well together as a team , yeah . Mm-hmm . Yeah maybe we could've used the whiteboard a little bit more , yeah , I think we we did , uh in more than one respect and uh so I think we did very well here . So I I thank you all very much .

## Complete Meeting Transcript

Hello. Designer. Yes. Yeah. Just the look like, the button part I'll explain. Okay. Now the um we decided upon including certain features on our remote. Now these features includes the s um signal emitting uh signal it's the led or L\_E\_D\_ the infrared. Now uh we have included the switch on and off button. Now we have included another feature that is the mute button on the side of the model. Then we have included one to nine buttons for controlling the programmes the different channels. We have also included two buttons for increasing or decreasing the volume. And we have also included two buttons for scrolling up and scrolling down the programme channels. Now our our model also contains a button which is called as the menu button. Menu button. Yes, menu At the centre we have included a button which is fluorescent green colour and this is the menu button which will control the colour, sharpness, brightness of this uh picture. We have also included a button which is called as the swapping button. Now this is uh a special, special feature which we have included. Now this button is an elongated

shaped button and this is slightly flexible so if it is turned towards the right it will take to the previous channel, if it is turned towards the right it will take to the next channel. It will take the user to the previous and the next channel so this is a swapping button. No, swapping is if if example you're you're watching the second channel and then you go to the tenth channel and if you want to go back to the second channel you can swap, this button. Yes. And at the end, it this remote has inbuilt voice recogniser which c which will recognise the user's voice and then it'll act accordingly. So this is our proposed model. Now the marketing expert has to give her suggestion whether it'll be sellable or it'll be cost effective. Yes, yes. Yes. Mm. Abs okay. No, these the front buttons which are here, are the mute buttons. Yes, yes. Yes. Pardon me? This is the menu yes, yes. A the the these these two are th to increase or decrease the volumes, and these two are to uh scroll the programme channels. Scroll up or scroll down the channels. Yes, it will have uh these buttons will have the numbers and all the rest of the buttons will have symbols. Yes, which can be easily recognised. Yes. Yes. Yes. Yes. Yes. Yes. And and one more feature is we we have a holder for this remote which is an oyster shape. A shell shape. Yes, yes. Yes, snail shell. Yes. Mm-hmm. Y Yes Yes. Yes. Yes. Single curve? Mm. Plastic. Is this for the case? Yes. Yes. Yes. No. Speci Yes Yes d we do have special form. One two three four five six seven eight nine Nine points, okay, yes. Okay. On the desktop. Okay. Fee selling. Yes. Okay. Okay. Yes. Yes, yes. Yeah mm. Worse, okay. One. One. One. Yes. I'll give three. Two. We can always improve, yes. Yes, features. Yes. Voices. Yes. Yes. And maybe Yes. Yes, yes you've done a good job. Whiteboard more, yes, yes. Yes. No. Yes. Cel celebration yes, yes. Thank you. Okay. They say it's forty minutes. Okay. Hello. Yeah. Yeah. Uh so this is our what uh we have made. This is a model of the remote control which we are going to build. Uh this is us in a snail shape so uh it is attractive um and it's it's blue in colour uh bright and uh it has yellow buttons and all the different colour buttons so it is a uh uh a looks-wise it is beautiful. Uh and also compact in shape. Uh um and also i it will be easily fit into into the hands and you can access all the buttons easily. Yeah, oops, sorry. Um yeah and um uh the material which we are going to use for the case is uh plastic and uh w which which is s strong um uh and also uh for the Um the material is plastic and uh for the buttons it is uh s soft rubber um and als yeah. Yeah because uh uh you'll be touching the buttons more so it is soft when you touch it. And then um uh for the for the led, for the light emitting diode it is a fluorescent green and it's a a it is a bulb like an ordinary in

frated. And and the button button's part uh will be explained by F Francina. Tell, yeah. Mm-hmm. Mm-hmm. Hmm. Mm-hmm. Ah. Yeah, definitely. Yeah. Yeah. Yeah. Yeah. Yeah of course, and also Hmm. Yeah. Yeah we can Text. Text that we can have on the case itself, we can it will be printed on the case and symbols as well as the buttons. Yeah. Yeah. So it is yeah, yeah shell. Mm-hmm. Mm. Yeah, of course, yeah. Mm. Mm-hmm. Mm. Mm. Mm-hmm. Mm. Yeah. Yeah. Mm-hmm. Yeah, yeah. No. Yeah. This is a Yeah. Yeah. I think uh that is uh f for rubbers that is uh yeah case material. Mm-hmm. Yeah. Yeah. Uh, I think that's the price. Maybe it is it just n Yeah. AMI. AMI should for Yeah. Mm-hmm. Yeah. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Yeah. Yeah. Mm-hmm. Yeah. Yeah. Eight twenty so We have um four euros, yeah Yeah. Yeah. Yeah. Yeah, yeah. Yeah, still. Yeah. Included, yeah. Hmm, hmm Yeah, even my yeah, shape is one. Yeah, even I think it is one. It's quite small. Yeah, one. Uh maybe two, yeah. Uh three, mm-hmm. Yeah. Maybe we can yeah, include some more buttons and uh um yeah features. We can make the buttons few buttons smaller. Uh I think they are quite big, so I think I I mean we can just have small buttons and more buttons in that case. If we want to have more features than that. Yeah. Yeah, definitely. Mm-hmm. Yeah, definitely, yeah, two mu mute buttons. Hmm. Mm-hmm. Yeah. Mm-hmm. Even I'm happy. Yeah. Yeah, yeah, definitely. Mm-hmm. Yeah.

Yeah. Yeah, probably. Yeah. Hmm. Yeah, many. Yeah. Ah. Yeah. Yeah. Thank you very much. Do we do we have some time left? Uh you have Oh, alright. Hello Mm-hmm. And she was challenged on that point Okay. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Good. You used to have all the buttons Oh that's good, no, that's nice and friendly. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Mm-hmm. Okay. Yeah, okay, mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm. Menu button. Mm-hmm. Mm-hmm. Of the screen. Mm, mm-hmm. The next channel in the numeric pattern, or Yeah, mm-hmm. Mm. Okay, okay. Okay. Mm-hmm. Okay, well um what what I really like a lot about it is that you can reach the whole thing with one thumb, that you can really hold it in one h you don't need two hands and it's easily reachable even for somebody with a small hand, yeah? The buttons are all raised and if you hold it in the centre of your hand you can even reach it over here so you don't have to turn it around, turn it upside down, move it up, up and down, I really like that. You really did a good job on that, my little designers. Um and um I like the idea that the on-off button is in a really prominent place. That's that's a really good good thing. Yeah, that's great. Mm-hmm. The colour's very attractive. Um the um these buttons uh around here are the mute and these mm-hmm On both sides they're mute? So you can push either one? Okay. And this brings the menu up on the screen? This brings the menu up on the screen and the orange ones are Okay. F f okay. Right, very good. Uh it looks mm looks like something I can sell. Okay and now I'm supposed to yeah. Yeah. Good point because we need the symbols 'cause we're going into an international market we can't have anything that's language dependent. Symbols on it. Mm-hmm, mm-hmm. Mm-hmm. Mm, 'kay, mm. Mm-hmm. For the snail, yeah, mm-hmm, we have the snail shell. He goes right back into his shell. Well you know I think we could do something really funny with this too because the snail is known to be slow and we could have some sort of little comic effect on our marketing about how this is a rapid snail or something like that you know that would, that would really work. So I think voice recognition is our big selling point 'cause nobody else seems to have that in in this price range. Yep uh well I think that everybody's gonna say their remote control is practical. I think we have to, we have to dwell on on on the appearance. We're really gonna have the be the cutest remote control on the block. So I think we have to play with

the image, play with the snail image um play with the visual and then the voice recognition. I think those are the two things to push. The look and the voice recognition. They're gonna be our two selling points. I'm supposed to make a little presentation, aren't I? Okay. Ah, but in my instructions I think it said I was supposed to go to the board and do something. No? Yeah, that's me. Oh, okay. Sorry, sorry. Mm-mm. That's right. Can you just fill it in in the yellow boxes? Or Well. I guess it's double curved. Mm-hmm. Rubber, because we're gonna have the soft buttons. Oh okay, the mm-hmm, mm' kay. Mm-hmm. Mm-hmm. No, 'cause we didn't put the clock in it after all, right? Mm-hmm. Yes. Mm-hmm. Yeah. Mm-hmm. Mm-hmm. Okay, I'll take my file down so you can bring it up. 'Kay should be able to get it now. 'Kay, why don't you move just to the next slide right away. Yeah right away. Okay, well uh obviously my method for uh s m the marketing of this thing is first to ask the big question, will it sell? And I think we should show this prototype to people from various age and socio-economic groups and see about any fine tuning that maybe little things we haven't thought of. We can't accept every suggestion of course, but maybe we just need to get a few. And show the the prototype to consumer research groups, we don't s want somebody to suddenly come to us and tell us that this button is toxic and you know some child will swallow it and then we won't sell any. So we have to get some input from those people. And then after that we just have to go with our best intuition and you know we like it, we think it's good, we're gonna get behind it and sell it. Um, next slide please. Okay, now the things that I

was thinking and th my wish list has really been realised in this prototype. I wanted the shape to be biomorphic, I didn't want anything with angles and all square, I wanted it to be comfy and roundy so we've got that. The size is small, the colour's bright and warm which is what we wanted. We wanted the feel to be as soft as possible, we'll have the soft buttons and the way this is shaped, even though it's gonna be hard plastic, it feels good in your hand so that's nice. And functionality I put last on my list because people aren't going to use it before they buy it. So paradoxically the other features, in other words, the look, the feel um and the shape, that's what people are gonna get in the store. They don't have a television in the store, they can't play with it. Um so they'll be our main selling points. So um th those have been fulfilled by your prototype and go ahead to the next slide please. Okay, so um the shape um I think is a a one. That's really, really excellent shape. The size is small um and th these points are in the importance for the, for the marketing, these aren't i in how I feel. I think that it's I think that it's plenty small enough to sell but I think we're sort of right the scale is one to seven. I think we're sort of right in the middle as far as c other competitors. And our colour I think is great. The colours are bright and warm and we really do great job there. And given um the constraints that we had I think we got it as soft as possible. And then functionality um I think you did a really good job on functionality, obviously we could have ad added different functions but then we'd disturb something else so I would say that we got to a five out of seven on on functionality. So I think that basically we've got a great product and we can get off and running with it. Yes. Ah. Well, um we had what, eight eight euros twenty as our cost? And so we've got we've still got four euros to go to spend. Mm-hmm. Well um that's Mm-hmm. Well as we know in today's technic technological world you can do just about anything at any price, the the the problem is quality. So we're just gonna have to settle for whatever quality that will buy us. And um it may not be the greatest quality but it may sell anyway. As we've seen with so

many of these kinds of products. Uh, well I isn't this my last slide? Maybe. Go ahead. I think that was my last slide, yeah. Um. Mm okay. And I'm supposed to present this scale on the whiteboard. Um and we're supposed to talk about those things as a team now, so if you put my last slide back up there. I'm sorry I've um forgot to do that, um. Hmm? Well because I can't remember what I put on there. Okay. Now I'm supposed to see how long my leash is here. Mm 'kay. You ready. So now we're all supposed to say what we think. Um okay so on shape I gave it a one. Wait what would you ra uh one being good and seven being the worst. Um what do you think the shape is? One, okay, and Be Betsy? Okay, uh-huh one, okay. And how about on size? On size I gave it a four, yeah, I feel it's just average. Okay. Mm-hmm. Okay. Okay you're the designer, of course you wanna give it a one. Um and then how about how we doing on colour? Colour, I gave it a one. I really like all those nice bright, warm colours. One. One, one, one, okay. And how about the feel? Taking into um consideration texture and comfort in the hand. Okay, I gave it a three, two, yeah? Three. Two, okay. And the next is functionality where I I admit I was a little hard on our team here, but Yeah. Mm-hmm. Okay. Two, okay. Three? Okay. Well, um. It looks like we've got got ourselves a pretty good product. Um the functionality's the only place where maybe we have to think about m m maybe, heaven forbid, having another meeting. But um otherwise I think we're we're ready to go to go with this product. Anybody else have any other comments or any other things that we feel we should evaluate? Mm-hmm. Well then again if we're gonna um do the speech recognition thing we're gon there gonna be some buttons that are gonna have to be added for that for the recording of the the speech. So that that's where we're gonna have to do maybe we can eliminate one of the mute buttons, instead of having two mute buttons. And um then maybe we can do something with the um the volume control. Maybe we can put that all on one button. Um and a couple of other th maybe comp uh consolidate some of the usage an and see what we can do with that.

Mm-hmm. No. Mm-hmm. Mm-hmm. I'm pretty happy with it too, yeah um, it's something I think I can market. Yeah. I think you've done a good job, Miss leader. Yeah I d I do too I think we worked well together as a team, yeah. Mm-hmm. Yeah maybe we could've used the whiteboard a little bit more, yeah, we didn't use that enough. Mm-hmm. And we used the slide because it was better positioned. Mm I think that's true mm-hmm. Mm-hmm. I think we were we were very good, yeah, mm. Mm-hmm. Okay. Yes, yes. Celebration. Today we have apple juice and after we sell m million of 'em we have champagne. Mm-hmm. Mm-hmm. Mm-hmm. Okay. Okay. Watch I I have my cord behind you here. Okay. But we we were told we could end the final meeting at any time, whenever we felt we were finished. It'll take me the rest of the time to get my microphone out from my necklace. Oh, there we go. Well hi everyone again. Um like before we uh I have to redo the meetings from n th the minutes from the last meeting and so here we go. Uh it was discussed in the last meeting uh which was opened by the presentation from the interface um designer that uh looks would be very important on this new remote and um it is to send messages of course to the T\_V\_. It should have nine channel buttons, a next button, volume buttons, subtitle buttons, switch to control features, colour contrast, sharpness etcetera. It should have a memory switch, a mute button in case the telephone rings or something. Uh speech recognition is one of her very f favourite personal uh features she would like see d d to be integrated in this um in this new remote. Um. Should be child friendly design with few buttons, colourful maybe with s star shaped or other shaped buttons. Um she uh presented also an oversized remote which she guarantees nobody will ever be

able to lose. Um that's right. But uh her very f personal favourite really she, she would very much like to see a speech recogniser integrated in this remote. The industrial designer um presented her uh thoughts on the issue. She would like a special case made out of plastic that is very strong, not using any harmful materials, should be recyclable and should be colourful. Should have an integrated circuit board that's highly sophisticated and temperature resistant. She would like to see a timer and or alarm facility integrated. Uh technically this thing would also have a resistor and a capacitor, diode transistor, resonator, and if possible a rechargeable battery. Uh and of course a circuit board. And how it would work, you press the button, the chip is morse morse code related relays the uh to the generat to the generator amplification and uh the circuit board is very inexpensive to build and so she thinks this is a great feature uh to to to consider. She would like uh this whole thing should be push buttons with a simple chip uh scrolling method is more expensive and not that practical anymore. Should be battery operated and of course she would have the special cases. The marketing expert uh who has to finally come up with to to to market this product has been watching the competition, has done some research on the internet and also has used h her personal observations to come up with the fact that such a remote sh should be small, easy to use and it should be eye catching. From her point of view of course one of the most important facts is that we should get to market before our competition does. To do that uh maybe one or two features should be developed on which we could dwell on or in other words on which our campaign could be built on. Too many new features or too many points would only confuse matter. So we prefer to have one or two features that can be really uh driven home. Um it should have a fruit and vegetable design and should have a soft feel. She feels that's really what people want today. And the decision that we took last time was that uh the special feature we would like to see is a speech recogniser, the energy should be battery uh should be on a chip, should be trendy design, compact and strong, and should have buttons. And that concludes the presentation from the last minutes from the last meeting. Now uh we are ready for the presentation of the prototype. Mm-hmm. Mm-hmm, mm-hmm. Mm-hmm, mm-hmm. What kind of button? Menu? Uh menu th menu, uh one one. Okay.

Mm-hmm. Mm-hmm. Yes the buttons are all raised, right? Are raised, mm-hmm. Right. Or have two hands to operate it, yeah. Yes, and it sort of sticks up so that you really you don't have to go first go like oh yeah here it's on and yeah, mm-hmm. So if you're left-handed or right-handed it doesn't matter. Well, I have one question uh will there be anything written on the buttons, like that people know, or they have to learn that from a piece of paper which button does what? Will have symbols so that that the user really knows you know and doesn't have to first learn it Yeah. But anyway it would have to have some kind of symbols, text or something so that people know That's right. Okay, yeah just wanted make sure of that mm-hmm. Right, mm-hmm. Mm-hmm. Right. Now what, what are our special features for the marketing? That's really the voice recognition that's really unusual And then, and then the other thing would basically be shape or practicality of use. You know. Colours. Mm-hmm. Cutest. Yeah. Okay, now uh having said that No, now this was our evaluation criteria which we uh just have done. Now we're gonna talk about financing. Well, there is a production evaluation. Is that you? But that's after the financing. See? Fi see? Um. Okay, we had looks and voice recognition. Okay now on the financing we bring up the mm there it is. Okay uh energy source we say that's battery, right? Okay, now. So we I guess we use one. What? T cell or chart

you are trying to change is protected. Well, that's nice. She told me I could just change it here and then it would It doesn't work. Hmm. Oh, okay yeah, okay, let's see. Okay, one, okay. Oh go away. Um kinetic source so that's in the energy source that's all we need. Uh electronics, simple chip on print? Is that's what we're using? One of those? Come on. Okay, one. Uh regular chip on print. No. That's all we need, the one case, uncurved flat, single curved, double curved. Double curved? One of those? Case materials supplements. Plastic we said, right? Uh wood, rubber? Uh but, yes but That's just for the case material, so special colours though, we having that, right? And then we have to interface push buttons. Scroll wheel, no. Integrated scroll wheel, L\_C\_ display? Button. No. Uh, button supplement special colour? Special form? And special material, rubber, wood, yes. Okay. Total seven point six whatever that means. That's the price. Mm? Eight, eight point two. That's hmm? Eight point two, right? So, we looks like we are well within budget. Okay. I guess I should save this I suppose, huh? Oops. Uh-huh huh huh. I just tried that. My documents, computer. My compu Ah oh here it is, yes. Okay, fine. Save. Okay good, so that's the good news. We gonna be popular. Um. So that uh I think financing was pretty simple. Now we would like to have a presentation by the marketing expert on production evaluation. You wanna go to the next slide? Okay. Um I just realised one thing. In the financing there was no room for our voice recogniser. And uh I don't know how we can evaluate that or how we can include that, too. Eight, eight twenty, yes. I mean maximum we have another four point three euros I mean four thirty. But I mean we have no way of presenting that to management as you know as a finished, as a finished product and saying okay with the voice recogniser that costs so much. So um we just have to beware of that. I mean and know whether the four thirty will really cover that. Yeah. I'm sorry to interrupt then but I just uh recog I just remembered that there was no that that was not um included uh that there was no room for any special features, okay? So to beware of that. You wanna go to this next slide, marketing expert? I dunno. Yes it is. Mm-hmm. Oh. Why? Why you need that up? I think you can make it there. Yes I think uh shape is one. You you gave it a four. Um, I dunno. I think I would give it at least a two. Colour uh I One. I like the colours. One. Uh, I think I would give it a two. Well it's also you can't really try it out uh the other things you have have more is are more tangible so from that point of view but um I'll give it a three. Uh. Here is what we looking at uh satisfaction on for example room for creativity. Um. Is there more room for creativity or are we absolutely happy? Y um al always bearing in mind that right now we are of course well within the budget and that we still you know we probably

can't, with this particular item, we probably can't just uh add a whole lot of more things. Uh um we need uh you know we need to leave space money-wise for the voice recogniser. Um. So th the question really is how do we feel with the project process? Uh, um are we happy with the creativity that has passed here or we're not happy with the new product we created or that was created? Uh I think personally I think uh I'm pretty happy. Um an and then the next question is are we happy with the leadership of this project? Uh And I think team work I think was very very good, I think we really yeah. Mm-hmm. And uh I think we are we happy with the means we used? We used whiteboard, we didn't use digital p well digital pens I guess are these things. Yes, we could. Uh, it's maybe not in the best position in the room um you know like sometimes it's positioned so that it's much better visible for everybody and I think from that point of view we sort of ignored it a little bit. Yes, I think so, I think absolutely, and fortunately

we all had slides presentation which made it a little easier. Um did we new did we find new ideas? I think we did. I think we we did, uh in more than one respect and uh so I think we did very well here. Are the costs within budget? Yes, yes. Uh is the project evaluated? Yes. Um then celebration. So I I thank you all very much. Um, I think this was very good and um I think we did come up with a new product that's uh feasible. Feasible from the production point of view and feasible from a marketing point of view. So, thank you. I always get it on here, but getting it off is Ah yes we have time later but we don't

## Executive Summary

Um first of all , um if you make minutes yourself as well , uh like Sebastian does , um could you put them on the shared folder ? Ease of use is important , but uh innovation is more important , and a fancy look and feel is uh even more important . And uh some fashion watchers have found out that the young target group likes fruit and vegetables in their uh clothes , shoes and furniture , and that they want spongy material . I assume they just want something colourful . Not uh specifically uh an apple as a remote control or something . the corporate colours are grey and yellow . Maybe soft material or something . But not a real sponge . maybe it rubber or uh like cell phones , exch exchangeable covers . You could make a few v very colourful ones , and uh a very traditional co cover . a few interface I uh I found on the internet are are these . but they're very advanced and very high-tech and just um , well , a weird um shape . But we could make uh a round uh an oval uh um remote control . Uh yellow . And what I'm thinking about , maybe um we should make very light but um uh a grip um I mean this is how you hold a remote control . There are there are also remote controls who have uh a little shape underneath where you can put your fingers in , in this um interface we can have uh high-tech with the voice recognition and uh , well , the the fancy colours and uh and so on , and still have the ease of use , We have the uncurved or flat case . Uh that's the most common uh remote con control form uh We have uh a curved one . Uh and we have an even more advanced uh shape , which is curved in three dimension . We can use plastic , uh which is the same for rubber , We can use wood and titanium . we cannot use the titanium on the double curve cases . And these latex cases , there's there's just the plastic ones uh won't allow the use of solar cells as an energy source source . we even seem to have uh hand dyn dynamos for uh powering our uh remote controls . Uh there's there's also a kinetic energy supply . I think um , if if I can hook on to that , um the kinetic thing is very funny . But if you're watching a movie , how many times uh you take the the remote control and and But uh the problem here is that it it supplies a a very little amount of kinetic energy . but maybe maybe there's a possibility com to combine it with m uh traditional batteries , because I guess the voice recognition feature u consumes quite a f uh a lot of power . And we of course have the traditional uh solar power , um of course we have the push-buttons and uh we also have scroll-wheels . And these scroll-wheels can also be integrated with buttons . Um uh in the indicators we have the L\_C\_D\_ displays , we can just make four push-buttons in a form of a round . Yes . That is possible too . Yes . I can't see uh any uh scenario where you would use a

scroll-wheel with a button on it . Um with uh maybe a channel selector . What about integrating a scroll-bar on this side ? Yeah , uh that's a possibility , There's no scenario where you use uh the button in the scroll-wheel . this is my volume button . And I can either on this side or this side um And click it to muten the device . So it might attract uh the young customers . it's it's been done years ago and I don't see it anywhere now . So in that case uh the volume button on the side uh of the remote control would be perfect . Yeah , yeah . Okay . Uh we have a simple , regular and advanced chip . And there is something like a sample sensor and sample speaker , Uh in the voice recognition you say a word you can programme words like uh v uh volume up . Of mute , let's say mute . and uh when you speak in the the remote control , it repeats uh your saying . It performs the action . d did we already decide on the display ? Especially when when we have to look at a cost , I don't think uh No . I don't think you need it . I thought um the market would like uh a sort m sort of titanium casing , but they seem to like natural uh stuff . Um I've chosen the more battery with solar cell uh solution for the energy . The kinetic thing it it's it's a possibility . but I'm I think you should combine it with batteries . it's maybe a bit too too flashy , So it it needs to be rubber . the younger people liked soft material . But they really need the regular chip , if you if you stick with the the simple uh straight-forward uh not curve design , i uh it's too dull . And um if you uh take the double-curved , uh then you cannot um you can only use the rubber buttons and you cannot use the scroll-wheels . But but do we want the curved uh uh design , So I think this is the best of two worlds . what about um the issue I um addressed at the beginning of the meeting ? Um the voice function w with the infrared uh issue . It's it's uh I uh I can imagine it's very dull to talk to a device w if you have to point to another device . But most infrared uh remote controls don't have to be pointed at all . it depends on your walls actually . Um I suggest we use the the sensor sample . Uh the sample sensor and sample speaker . Um with a with a regular chip . And and the scroll uh scroll-wheels . Yes , yes . And uh skip and skip the L\_C\_D\_ part . Yeah . according to Ruud , the the the market likes um new flashy technology , Because if we do have enough um space in in our finance , I would say do integrate it , But we already have the scroll-wheels , the sp uh the speaker uh the speak recognition , the rubber , the fancy colours . Yeah . Okay , I I agree . Um then the corporate identity should be uh in the product . I guess that is something for Roo and Sebastian . Uh you talked about it before , the colours , grey and yellow . The next phase , um Sebastian , um is um the design of the look and feel . The user interface design . And for you , the product evaluation . Um and uh the I\_D\_ and the U\_I\_D\_ need to work together on the prototype drawing on the SMARTboard . can you uh give us a summary of all uh decisions we've made ? The casing is curved , single-curved . Traditional batteries uh and solar . Yeah , with colourful rubber . What about uh the finishing of the case ? Uh if it's possible with uh different um covers , and I think we should use the company colours . Something like black and red . uh black and yellow . Yeah , although I don't think that's very colourful . Except for the yellow of course , It's quite modern actually . I was more thinking about the fruit colours that the Ruud showed us before . um you must have a red uh on and off button . Um so maybe it shouldn't even be two colours , it should be a full colour cover with such an image but uh I'm afraid it's not possible to print a picture on uh the device . The scroll-heel . Yes , the voice recognition we already decided . But there will be some additional buttons , I guess . because they're they're rubber too . Uh didn't did we inc uh include the digi digits or uh leave them to the speech recognition ? What I said in the in the first uh discussion , uh the digit six on the button , it will disappear when it's from rubber . 'Cause things like uh volume could be

uh placed next to the button . So still then , if you feel uh li uh if you feel your remote control , you just rub on the cover , so you rub on the painting . What about um making this rubber and making this plastic ? we should have it the other way around , I guess . A plastic cover with rubber finishing . I'm I'm not so sure , I have to ask with manufacturing , Um I guess you two have to figure that out . We use the regular chip ? Regular . Uh I think our customers will go insane . So if you want the spongy feel , you need uh to make these buttons all all of rubber .

## Complete Meeting Transcript

Hello hello Mister P\_M\_. Well, that's where the thinking goes on. I think you should punish him. You're the P\_M\_. Possibilities, yeah? Yes. So Not at all. Okay. Just press the okay button, it works. How surprising. Oh wait uh wait up. Uh so do you think um when fruit and vegetables are important for clothing and shoes that they are in remote controls also? Not something dull. Okay. But can you can you go back to that slide? The uh just one slide back, no no no. Yes. Okay, and the feel of the material has to be spongy. Has it something to do with that uh natural feeling also, do you think? Okay. It's quite interesting. Yes. I don't know the phone, but I can imagine it. Oh, that one, yes. Now I kn uh oh, I know, I know. Yes, I I've seen it. I've seen it. So So ease of use is important, but technology is twice as important. And what was even more important? Okay. So that's the most important thing for our customers. Mm-hmm. But it's it's kind of uh it's kind of o organic, so that's very good. Yes. Slippery. You have to grab it. Yes. There are there are also remote controls who have uh a little shape underneath where you can put your fingers in, so you can get a really good grip on it. So you you don't have to um attain much pressure to it. It's it's a lot easier. So m Yes. But I'll I'll go into that deeper in my presentation. Okay, but I'll I'll go into that, because there are are some possibilities and some impossibilities. Um I had a talk with uh our manufacturing uh division, and uh we had a talk about all the different components um who are in this design. Uh these are the things we've looked at. And of course I used the web to uh find my information. About the casing, we have three different casing possibilities. We have the uncurved or flat case. Uh that's the most common uh remote con control form uh we're used to is just a it ju it's just a box. I'm sorry I I don't have any pictures of uh of this thing. We have uh a curved one. It's uh curved in two dimensions. You have to imagine it's a bit like a wave form. So it's uh a little more advanced in its in its shape. Uh and we have an even more advanced uh shape, which is curved in three dimension. I c I think you can compare it a little bit with the uh big grey image uh you had in your presentation. The the big remote control, something like that. But it's quite uh advanced and it's it's quite daring to to use I think. Um for these casings we have uh different types of finishing. We can use plastic, which is uh very slippery and maybe not so nice, but you can give it any colour, uh which is the same for rubber, but it's not slippery. We can use wood and titanium. Well, um we cannot use the titanium on the double curve cases. And these latex cases, there's there's just the plastic ones uh won't allow the use of solar cells as an energy source source. Which brings me to the different energy sources. Um well, we even seem to have uh hand dyn dynamos for uh powering our uh remote controls. You really have to imagine like winding up your uh I d It would be very new, but it's a kind of a retro uh style, I think. Uh Well, this is quite interesting. Uh there's there's also a kinetic energy supply. So um when you're watching T\_V\_ uh or when you're you you have to um make some kind of energy kinetic energy by shaking the remote or throwing it against the wall, whatever you wish. It have it it has

to move, that's the the sense of it. And you can store the energy in the in the thing. Mm-hmm. It's very funny indeed. Mm-hmm. Indeed. Mm-hmm. Yes. But you know you know from your own watch your watch uses uh a minimal con it consumes a minimal amount of energy. the the shaking of your body, which is almost uh every activity makes your uh body shake, uh it charges it. But uh the problem here is that it it supplies a a very little amount of kinetic energy. So I think uh you have a problem when you're watching a movie and uh you haven't moved the remote uh i remote control in a in an amount of

time, and you want t to switch uh the channel or something, well, m it might not work. So that's something you have to keep in mind. So, but maybe maybe there's a possibility com to combine it with m uh traditional batteries, so we can save on the batteries and um when there's enough kinet kinetic energy, use the kinetic energy, and otherwise use the batteries. Uh yes, it does. I'll come to that later. And we of course have the traditional uh solar power, which is just uh uh uh uh uh a piece of material on the remote control which transfers light energy into electricity. The user interface controls, um of course we have the push-buttons and uh we also have scroll-wheels. And these scroll-wheels can also be integrated with buttons. So it's just like a mouse. You can scroll 'em, you can also push it. Um uh in the indicators we have the L\_C\_D\_ displays, which means uh you can watch uh in a display w which channel you have chosen or something like that of the li amount of volume which is uh currently uh and we also have double scroll-buttons, which are just two of these things. So we don't really have the the kind of button we had in mind in our uh uh in our last meeting, the the thing with the the round with the four Yes. That is possible too. Yes. Mm-hmm. Well, mayb uh well, m me neither. Maybe when you integrate some functions. Uh it's do it's done before. Yes. It's quite quite good, yes. Well, it's it well, i what he means is there's an button integrated in the scroll-wheel. There's no scenario where you use uh the button in the scroll-wheel. You just use the wheel. About mute. Well, yes. Okay. Yes. Well, okay. Well, that that that's one possibility, okay. Well, okay. It's quite goods. Mm-hmm. Yes. Hmm. But it's done before, uh there are many other devices um like uh telephones and our uh radio, pocket radios. We use this. And Well, it's it's been done years ago and I don't see it anywhere now. So maybe it's not no. Hmm. Yes, but it uses two separate buttons. It doesn't use a. Well. Uh something for uh Roo here. Wi within reach. Yes, you have to. Yes. yes. Yeah, yeah. Okay. Okay, um we have to know, if you want to use uh these rubber double-curved c uh case, um you must use these push uh push-buttons. There's no way you can integrate L\_C\_D\_ displays. There's no way you can integrate scroll-wheels, because it's all curved. There's there are no uh flat areas where you can incorporate these things. So that's a limitation. About um the components, uh just the hardware. We basically have uh three types of chips we can use and uh these chips incorporate all the Logica and um um uh hardware that is needed to send uh to send a signal. Uh we have a simple, regular and advanced chip. And there is something like a sample sensor and sample speaker, which is a little cryptic uh to me. But I think that's the the voice recognition thing that we are uh thinking about. Mm-hmm. Okay. Okay. So so okay. Mm-hmm. Yeah. Okay. Mm-hmm. Okay. Okay. Okay, so that's basically the the voice recognition item we were searching for. Okay. This sample sensor uh requires an regular chip, I thought. Um no op I'm not very sure. No, it's not in here. If we want to use the L\_C\_D\_ display, we really need the advanced version, which is a bit l little bit more costly. If we want to use the scroll-wheels we need the regular version. And if we don't want to use uh any of these uh more advanced functions we can keep with the simple uh chip, which is a bit cheaper. Okay. Um no, but I think that's something for uh Roo here to think about. I I don't think either. No. I don't think you need it. Okay. Okay, well my conclusion, um unfortunately the market has decided the a little uh other than I thought. I thought um the market would like uh a sort m sort of titanium casing, but they seem to like natural uh stuff. So maybe we should think about uh wood

finish. Um I've chosen the more battery with solar cell uh solution for the energy. It's more reliable, it's cheaper. So I do

n't think we should use the dynamo thing. The kinetic thing it's it's a possibility. It's it's more advanced, but I'm I think you should combine it with batteries. Otherwise it will not too advanced, uh well. It's in in some way it can give us an advance, because you will save on your batteries. But Yes. And I think it's more robust. It's more uh Uh it's more functional. The titanium thing uh we have to skip it. So I think we should skip the titanium uh stuff, and we should uh use wood or something like that. Oh okay, sorry. So it it needs to be rubber. Okay. Okay, spongy materials. Okay, um well um these scroll-wheels, I think uh they they can be they can be handy. So Yes, they can. But they really need the regular chip, you cannot use the sa simple Well, I'm not very sure. Maybe that's an uh a different I think so, if you if you stick with the the simple uh straight-forward uh not curve design, i uh it's too dull. I don't think c our customers will like it. And um if you uh take the double-curved, uh then you cannot um you can only use the rubber buttons and you cannot use the scroll-wheels. So I think this is the best of two worlds. Yes. It's it's uh I uh I can imagine it's very dull to talk to a device w if you have to point to another device. It's very unlogical. Well the there has to be some pointing at. But All lights get absorbed, yeah. Yes, because the walls they they reflect the infrared light. So it has an it's easier. Um I suggest we use the the sensor sample. Uh the sample sensor and sample speaker. Um with a with a regular chip. I think uh it gives us the advantage of Yes, yes. And uh skip and skip the L\_C\_D\_ part. I don't think it it's any uh value added thing. So Okay. Technology. Yes. It's not very flashy and new. Mm-hmm. Mm-hmm. Yes. Uh I think our customers will go insane. It's it's too much. Okay. Uh the n the next phase will be um the um not the what is the next phase f Flores? Okay. So i Okay. Okay. Okay, okay. Yes, they can work. They cannot work with double-curved. That's that's problem. I'll check it for you. Yes. Mm-hmm. Okay. Okay. So you will be on the Bahamas. Uh Okay. So can you uh give us a summary of all uh decisions we've made? I'll do. Okay. W start with the casing. Okay, single-curved case. Okay. What about the energy source? I I think they can. Yes. Well, uh It it should be. There should be really no problem. They can be supplementary. That's no problem. So So uh uh just uh the energy source is um the batteries and the solar. Okay. What about uh the finishing of the case? We have decided we wanted to use the rubber? Okay, and I think we should use the company colours. Something like black and red. uh black and yellow. Grey yellow, okay. Oh, I think it's uh it's not very dull. It's quite modern actually. Don't you think? Hmm. Okay. Okay, but uh I'm afraid it's not possible to print a picture on uh the device. Because uh I agree it would be nice to have have something like that on the device itself. But Oh, I've read. Yes. Yes, but our manufacturing department is not so advanced in its uh techniques. They're actually very slow in its techniques. So So I'm afraid it's not possible. Okay, so scroll-wheel. But there will be some additional buttons, I guess. And th the they should be spongy also, because they're they're rubber too. Well uh you can use well, when you use the buttons, they'll they'll be made of rubber too. So it has th the spongy uh feel also. So I I think that's okay. Yes. That's okay. Yes, the signs. Uh I see what you mean. Well, maybe that's possible, because um uh our manufacturing division also offers plastic finishing. So maybe they can combine these two. Yeah. Mm-hmm. Well, I'm I'm not so sure, I think it c should be Well, I'm not sure, I have to ask with manufacturing, but I'm I'm not sure that's what you want, because our customers specifically ask for the spongy feel, and that's what you get with rubber. So if you want the spongy feel, you need uh to make these butto

ns all all of rubber. I think both. I do. I think Okay. Um not quite. Um what about uh the chips? We use the regular chip? Okay. And Well no, I think that's about it. Yes. The only difference between the advanced and the regular version is that the advanced uh version of the chip supports L\_C\_D\_. That's

all. And we've decided not to use L\_C\_D\_. So Okay. Okay. I'll put it online. Do you need to change anything on it? Because otherwise I will already open it. Okay. Is it much changes? Uh I didn't No no. I do not have Only the same information. Hello, Sebastian. I believe uh Miss uh Tentel is with us as well, in the control room. Oh, it's that Roo again, always late. Bongiorno. Hmm. I see some interesting okay. People, welcome back. The third meeting. Um I have some points I would like to uh some some issues I would like to point out. Um first of all, um if you make minutes yourself as well, uh like Sebastian does, um could you put them on the shared folder? If you do not make minutes, no problem, but it's easy for me to see what you uh wrote down, so I could uh can uh um use that in the in the report. Um the second thing, um I was th uh s thinking to myself, I have this little remote control, and I'm talking to it, but I still need to point to the television, because it works with infrared. That's quite strange. Okay. We'll come to that later, I g I think. Um the agenda for now uh uh are there any pre-discussion questions? Okay. Um we wi we will have your individual presentations, uh then the decision on the remote control concept, um and uh the closing. Forty minutes in total for this. So um I think we we can immediis immediately start with the individual presentations, um the progress you've made. Um I think it might be smart to look at uh Ruud's um information first, because I understood there are some uh significant changes in the market situation. Um yeah. Uh w wait a sec wait a se uh could you go to the previous slide? Um because I'm taking minutes and it Um were the important themes enclose. Yeah okay. The feel of to be spongy Okay, so so, yeah, it might not be t uh it it shouldn't be too hard. It it maybe it rubber or or yeah. Okay. Yeah. Well, that's interesting. You could make a few v very colourful ones, and uh a very traditional co cover. Yeah, yeah. Yeah, it is, it is i yeah. Yeah. Do you know the phone? It's the Siemens uh C\_ twenty five, I believe it's it's the one the Post-bank uh gave away, the very You kn you know, Ruud, as well? About th Okay. Okay. Um uh okay. Do you have uh thit that was Okay. Okay, so the the m uh important findings are uh innovation is more important than ease of use for the our target group. And um colouring is important and and uh soft materials. Okay. Okay, Roo, could you do your presentation? Okay, well it's good to to sum up uh the things we already thought about. Shape. Yeah. And what I'm thinking about, maybe um we should make very light but um uh a grip um I mean this is how you hold a remote control. Um it shouldn't be too uh glatt, too slippery, s because um Yeah. Yeah, exactly. Yeah. Yeah, ex for your fingers, yeah. Yeah. It grips automatically. Yeah, okay. Okay, good. Yeah. Way too much I think for our goal, yeah. Okay, b but I think we'll yeah. Okay. Well, it would be very new to the market, but Yeah. I think um, if if I can hook on to that, um the kinetic thing is very funny. I mean solar is of course it's nice, but it's, well, your uh your calculator has a solar panel. Um hand dynamo Well, maybe m Yeah, I know. Yeah. Yeah. And wha Okay. Yeah. Okay, because I guess the voice recognition feature u consumes quite a f uh a lot of power. Yeah. Okay. Well This will be the remote, right? Um with uh maybe a channel selector. What about integrating a scroll-bar on this side? Because this is how you keep it Volume? Well, what about mute? Thi i i m I guess uh th this is my volume button. And I can either on this side or this side um And click it to muten the device. And and it makes it

different from the traditional uh devices on this market. So I'm looking for a way to uh make it a little different than the traditional ones. So maybe um I guess that that's something you two uh need to think about. Uh Ruud, wha what do you thing about uh a scroll-bar? Uh scroll-wheel. Okay. Yeah. Well, all the Sony telephones use it, for example, for volume. Nokia has a well, okay, it's not really a scroll-wheel, but on their side th the the volume button is on the side, because you gri grab it like this. Yeah. I know, it's not really a scroll-wheel. No. Yeah. For you too, yeah. Okay. Sebastian. Um Yeah. It performs the action. Yeah. Yeah. Okay. Uh well uh d did we already decide on the display? To No. On

screen display. Yeah. Okay th Okay. Good. Kineti okay. Okay, it's maybe a bit too too flashy, too yeah. Yeah, but that that's the same with the solar cell. That's no different. Yeah. Okay. No no, but the uh um that's what Sebastian said. He said uh this is what uh this is my personal preference. But but yet, I understood that the market is different. So um No, r rubber with colours. Colourful and Yeah. But but do we want the curved uh uh design, or I it's too dull. Yeah. Yeah. Okay. Okay. Okay, what about um the issue I um addressed at the beginning of the meeting? Um the voice function w with the infrared uh issue. Because it it's of cour Yeah. Well It depends also on your on your Well, it depends on your walls actually. If you have uh have um smooth walls, it it it probably you're probably right. But if you have carpets on the wall, which our natural loving friends probably do have, then um yeah, th th it might be a bit more of a issue. So Yeah. I like the scroll wheels uh idea. Yeah. Well, it looks uh yeah, well um according to Ruud, the the the market likes um new flashy technology, and I mean L\_C\_D\_ is well, ok I know, but it's m it's less um s standard than than Well, we are not very w we do not know uh much about the the f the financial part. That's the problem. Because if we do have enough um space in in our finance, I would say do integrate it, because it it adds a little ext extra high-tech feeling to it. Mm yeah. Okay, okay. Yeah. Okay, I I agree. I think i Ruud, do you have any um anything you would like to um add or or maybe thoughts or No? Sebast uh nee, Roo? Roo, do you have any other Nothing more. Um Sebas Well, we we need to describe uh decisions now. So um on the energy, well, we decided. Chip. The case uh rubber with uh c one one uh one curve. User interface um Um then the corporate identity should be uh in the product. I guess that is something for Roo and Sebastian. Uh you talked about it before, the colours, grey and yellow. Keep it in mind. And um the buttons, well we talked about it now. The next phase, um Sebastian, um is um the design of the look and feel. The user interface design. And for you, the product evaluation. Um I'm sure your personal coach will give you more information on that. Um and uh the I\_D\_ and the U\_I\_D\_ need to work together on the prototype drawing on the SMARTboard. And I'm going uh to plan my holidays. Yeah, it's it's uh when we come back in thirty minutes, uh you will have a uh prototype ready. Yeah? I can. Um maybe one of you could write it down. Great. Um Uh you you need to help me. Um The casing is curved, single-curved. Traditional batteries uh and solar. No, they can be complementary. Uh al al I uh Every device Yeah. Okay, um th Battery and solar, yeah. Yeah, with colourful rubber. Uh if it's possible with uh different um covers, but I'm not sure if our suppliers can uh can help us with uh with such uh uh a wish. Uh grey and yellow or black and yellow. Yeah. Yeah, although I don't think that's very colourful. Except for the yellow of course, but um I could think of a more uh attractive uh c uh set of colours. Well, I was more thinking about the fruit colours that the Ruud showed us before. Well, it it doesn't have to be red. Uh I mean th uh I think these colours are rea

lly what our young people are looking for. Um so maybe it shouldn't even be two colours, it should be a full colour cover with such an image or or I mean thinking in two colours is is too black and white for our m uh c uh market group, I guess. Black and yellow, yeah. Okay, so we have to deal with wh what's possible here. Yeah. Okay. Um more f more more decisions we made. Um Um The scroll-heel. Yes, the voice recognition we already decided. Yeah. Uh I'm going to leave that up to you two. Yeah. I think rubber is nice. Because it uh i I mean what do you touch the button, and what do they want spongy uh uh devices, or or i. Uh is that uh does our our supplier say so? Yeah. You could place a um uh this this would be the button. The scroll-wheel, I mean. And you could place the indica th th the signals the No no, there's no painting, only uh yellow or But it's into the rubber. Yeah, but this is on the pla yeah, I know. Um I think uh I know which you understand af uh I know what you mean. What about um making this rubber and making this plastic? Yeah. Well actually, we should have it the other way around, I

guess. A plastic cover with rubber finishing. I mean, this is this is the finishing. This is um what's on the edge. What you feel. But the front, on which the the buttons are doesn't have to be rubber. I mean I know, but do you touch this or do you touch this? I mean, I I never touch between the buttons. Yeah, the side, exactly, the sideways. The side, but do you touch between the the these buttons? Okay. Well, we do not have very much time uh left. Um I guess you two have to figure that out. I'm going to leave the decision to you, um because you have to make its prototype, and um yeah y you have the most knowledge about the suppliers, the possibilities and uh so I'm going to leave it the decision with you. Um Sebastian, did you write enough decisions down? Yeah. Okay. With those regular chips we can still uh control advanced functions. The chip is is not really Okay, well. Yeah. Okay. Um okay, then I think we are uh quite finished. Um I'll see you guys in thirty minutes and um Yeah? Yeah, um if you write wrote anything down, uh could you put it on the shared folder? Yeah. I know, but well Great. Right. Um Mm, don't think so. Unless uh things have suddenly change again. Uh don't know. Maybe uh you've got new information, like uh last time. Okay. Oop. No. 'Kay. Hmm? Oh.. Yeah, Okay. Yeah. Yeah. My method? Well, findings. Uh Ease of use is important, but uh innovation is more important, and a fancy look and feel is uh even more important. And uh some fashion watchers have found out that the young target group likes fruit and vegetables in their uh clothes, shoes and furniture, and that they want spongy material. Probably watch too much Sponge Bob. Uh the older group uh still prefers dark colours. Simple shapes uh m material. But we since we are concentrating on uh the younger group 'Kay. Well, uh one example given was this, so um I assume they just want something colourful. Not uh specifically uh an apple as a remote control or something. No, uh the younger group likes uh more colourful uh objects. But Which one? This? Yes. Uh well, it might. But personally I wouldn't like a sponge as a remote control. But Maybe soft material or something. But not a real sponge. Yeah, exactly. Yeah, and like uh the older group likes familiar materials, but that doesn't mean we should use wood, So Well, this this is an example of what they would like. But since we're conten concentrating on uh the younger group, I think we should use soft materials and uh make it colourful or uh like cell phones, exch exchangeable covers. So we could provide both for the young and the old what they like. I've seen it, but 'Kay. Uh that's about it. Yes. Uh soft material. Uh the fancy look and feel. Yes. Apparently. Yeah. Um Uh well, it's obvious obviously new. So it might attract uh the young customers. Hmm. And yeah, the yeah, the older people liked wood. No the Yea

h, the younger people liked soft material. Yeah. Yeah. Standard? Nah, um n no, I don't think so. M Hmm. Or black and yellow. Yeah. Uh didn't did we inc uh include the digi digits or uh leave them to the speech recognition? 'Cause things like uh volume could be uh placed next to the button. There the icons. So you don't touch the icons that much. Bongiorno. Punish. You wish. Welcome. Uh Yeah. No. Alright. But they like dark colours, you said in the p Okay. Well then I suggest that the corporate colours are grey and yellow. I had Or we could make oh. Yeah, o o I'm thinking about uh the Bananarama telephone uh telephone from uh Siemens. The yellow uh rubber telephone. It's the it's the rubber uh cover. And it's uh colourful. It looks likes a banana. We have the fruit, we have the colours. We have the simple design. Um thirty five. And the b the light blue and it's also in yellow. Yeah. Mm-hmm. Well, I don't ha really have much to add, um because most of things we already said in uh the previous uh discussion. Um Uh the previous ideas were voice recognition and uh the round button for uh the p channel programming and uh volume. Well, a few interface I uh I found on the internet are are these. These are both with uh with voice recognition, but they're very advanced and very high-tech and just um, well, a weird um shape. So I suggest I couldn't uh I had a small uh mock-up uh sign on the on paper. But it didn't work. My pen didn't load um the information. So I made a really simple f uh a shape

on uh in um PowerPoint. But we could make uh a round uh an oval uh um remote control. Uh yellow. But if you have something like uh the Siemens phone, it's rubber. So it's easy in your hand Uh indeed. Yeah. Great. Oh and um to add on um Ruud's information, in this um interface we can have uh high-tech with the voice recognition and uh, well, the the fancy colours and uh and so on, and still have the ease of use, because we have an easy interface. And all the other remote controls are high-tech in buttons and uh and so on. Yeah. So if you have the voice recognition, you can you can programme like thirty uh um thirty c uh controls on it. Yeah. Right. Great. Like the watch. But if you're watching a movie, how many times uh you take the the remote control and and if uh if you have a watch, you have the kinetic uh idea in a watch also. You you walk and uh but uh you you're sitting on a couch. Mm-hmm. Mm-hmm. Oh, we can just make four push-buttons in a form of a round. But I th I don't think uh the scroll-wheels I had some I had some information about it too. I don't think there's any possibility for us to use scroll-wheels. I d I can't see uh any uh scenario where you would use a scroll-wheel with a button on it. Yeah. Yeah, uh that's a possibility, but But Flores, think about a scenario where y where you would use the scroll-button for A volume, okay. Yeah. Wheel. Yeah, I believe uh if you have uh what we've earlier said, um the grip uh places in in the remote control. You have your hand on one place on the remote control, so you have to place all the buttons in a range of your thumb. So in that case uh the volume button on the side uh of the remote control would be perfect. Yeah yeah, you can um I have some information about it. Uh in the voice recognition you say a word you can programme words like uh v uh volume up. Of mute, let's say mute. Um you programme it, you m mute and you g you give um an uh an action to it that that's really the mute function and uh when you speak in the the remote control, it repeats uh your saying. So that's the sample sensor. So if you say mute, it says mute again, and then it's um well, I believe it's uh Yeah, and then uh he he repeats its action what which he believes it is. So you say mute, he repeats mute and you makes a computer sound mute, and then goes to the mute function. Yeah. Well, I don't have um I haven't looked for uh for information about it, but I don't think information uh y I don't think you need it

on a display. Especially when when we have to look at a cost, I don't think uh 'cause uh uh all any T\_V\_ can uh can uh view a digit on uh on screen, yeah. But what about um the markets uh wants colourful designs? So if you use titanium Okay. Oh, sorry. Yeah. Yeah. And I would think And they can be implemented with a regular chip? Okay, but we also uh we already need the regular chip for the sample uh sensor speaker oh, evalu But most infrared uh remote controls don't have to be pointed at all. Well, if you if you take your hand before it, okay, it won't work, but you can point it just to the other wall. Yeah. And the regular chip. And and the scroll uh scroll-wheels. Yeah. No. Think so too. But we already have the scroll-wheels, the sp uh the speaker uh the speak recognition, the rubber, the fancy colours. Um no. Nothing more. Uh but uh can't scroll-wheels uh work with one uh one-curved case? Yeah, okay. Sorry, yeah. Oh, sorry. Yeah. Yeah. The project drawing is for the next Yeah, right. Single-curved. But can there be uh wor can they work together? Or do we have to choose between them? 'Cause if we have to choose yeah? Okay. What if not? Okay. Yeah. Grey and yellow. Yellow case and grey buttons, I think. I believe the But you have already um you must have a red uh on and off button. And um Well well Well, there is. Just a week ago, a keyboard manufacturer would print, with and uh No. A scroll-wheel. Voice recognition, of course. What what did you say? Yeah. Yeah, or you could use plastic buttons. In the rubber. Yeah, b But then you just have the the fact that um the drawings on the buttons will disappear eventually. What I said in the in the first uh discussion, uh the digit six on the button, it will disappear when it's from rubber. It is not uh something uh it's no information I read about it or so, but it's just from No, but but uh it Yeah, b yeah. Yeah, that's possible, but then you have still the images on the rubber of

the case. So still then, if you feel uh li uh if you feel your remote control, you just rub on the cover, so you rub on the painting. Yeah. Yeah, but but the the plus or the minus. You have to draw the Yeah, it's on the cover. So if you uh You just move the problem. Y uh can you separate these uh these I do. Or the s uh the sideways. Or the the back. Or the back. I think Yes, especially when there are I a few buttons on it, you have uh a lot of space to touch. So you just have it in your hand completely or or i you play with it. Yeah. Yeah. Regular. Use with.. For the finishing touch. Uh yeah. But um Sebastian has everything.

---

# Meeting ID: 96

Data Source: Train

## Executive Summary

So today is um our third meeting . It will be about the conceptual design uh . um . We decided not to go for speech recognition technologies because of some reasons and we are not decided about u the use of L\_C\_D\_ screen on on the remote control because of costs . Uh at the end of the meeting we should take decision on that point . So each of you have some presentatio presentation to perform I investigate deeper the preference of the users . What I found in order of importance from less to more important is that people want an easy to use device . After they they want something new technologic technologically speaking , what they what they find more more interesting , more or more important it's uh a fancy look and feel instead of uh instead of the current the current trend which was f the functional look and feel . So now more more cool aspect , ma more a cooler aspect uh rather than a device with many functions and many buttons with instead of i instead of ha of a device which can do many things , a device which is pleasant to to watch , to see . all this fashion it's it's fruit and the the theme is fruit and vegetables . And also in the in the U\_S\_A\_ the the current the mor the most popular feeling it's it's a spongy . What what do you mean by fruit and vegetables and spongy ? I didn't miss and I saw that the fruit , there are many fr pictures of fruits and vegetables in the clothes . So we're not gonna have a remote control in the shape of of a banana , Vegetable textures and all this kind . So I ha I haven't thought of any particular fruit , but the general aspect of the of the remote control may may could remind some kind of vegetable , instead of vegetable , some natur mm uh natural object or something . or you want just some kind of like fruit logo on the No , not n not not too much focus , not too much focu not n not too s not too similar to a fruit because next year the ten the trend the trend will be different . I'm not , I'm not really sure if uh that would really appeal to everyone though , like maybe just like a little bit n a little fruit picture somewhere in the corner , Is fruit cool ? Okay , but it has to be easy to uh to use though and to hold you know , Well , probably the only thing is a banana that I can think of , a cucumber . Maybe too long . and you you you will not have pla enough a lot of place to put a L\_C\_D\_ on a banana also . and also it's I'm not convinced about this L\_C\_D\_ Uh do you want a an L\_C\_D\_ with twenty five Euros ? you're simply looking s to a remote control that looks like a banana with few buttons with only a few buttons . Okay . So I received an email um around lunchtime letting me know that the brilliant minds at our technology division had developed an integrated programmable sample sensor sample speaker unit , So you are User Interface guy . It means that it can recognize , it can do like a

match on a on a certain phrase that you speak and then can play back a phrase in response to that . I guess you could build that in , you could you could link the the recognition of a certain phrase to some function on on the remote control . but it basically means we c we can kind of consider this from uh you know uh a theoretical or usability kind of viewpoint without worrying too much about you know how to develop it because we have this already done . Is this a technology that recognize keywords speech keywords ? it's it'll recognize uh I guess keywords , but you know keywords in a certain order like a phrase . So this is not s really to do to do control . It's designed it's designed as a fun kind of thing , yeah comp completely pointless for the inter for from the interaction point of v point of view . So this is out of discussion . I think it doesn't really add much to the functional design and it's it's it's not mature enough to use as a speech recognition engine , so I've just done a quick mock-up of uh uh some of the features of our potential funky-looking uh remote control But um , I've just indicated here , we could have actually two scroll wheels , But I think it's important , you know , to have two scroll wheels because , you know , you want one for for the channel , but you also want one for for the volume , I've also included this turbo button because I think , you know , every design should have a turbo button , so with this turbo button you can , say , skip over t channels if uh , you know , if I'm if I'm going if I'm scrolling past them but I mean we can discuss about what other kind of buttons we need , um . it's just you know a couple of scroll wheels and a button cause it's hard to get so many buttons on a banana well , I guess you need an on and off switch , but you could you could o you could turn it turn it on by taking the top off the banana maybe , you know , So i it looks like we're going completely to forget about the L\_C\_D\_ thing . I I think we could use somehow the s coffee machine dialogue interface or so . No we can we can't use that . Well , I f I think it's probably more than , than our can handle because it's designed for a coffee machine , you know , to say hello in the morning . I don't I don't know if that speech recognition is , you know , even if we can do it , I think it's not really appropriate for uh television environment . It might be useful to have some kind of base station , even if it's just you press on a button on it and uh and the remote control starts beeping , you know , this is a way of finding the remote . So this is going to be about the component design . So first thing is we need power source for the remote control . So I was of the idea that we can have two kind of power supplies , one is the usual batteries which are there , they could be chargeable batteries if there's a basis station kind of thing and on top of that we can have solar cells , when the lighting conditions are good they can be used so it'll be pretty uh innovative kind . Then uh we need plastic with some elasticity so that if your if the remote control falls it's not broken directly into pieces , I guess that fits in with the spongy kind of design philosophy . and then it should be double curve . The s science for the ease of handling and there are some other issues why we need double curve . with plastic you can have double curve but with uh certain other materials we cannot have double curve . but plastic is I think is the most appropriate one , it'll bring the cost down Yeah but it's more easier to do a banana in plastic than uh in wood . but are we set on the banana idea ? the shape of a banana is not it's not really handy . Yes it is . Yeah , okay , so capsicum or pepper . Yeah . I don't know , it seems a little bit kind of bulky to me , like But like a banana you can you can be holding like this and have the scroll wheel kind of on top Okay , so push buttons for the traditional users so that they don't feel they are alienated , Then uh there are different kind of chips , one one is the basic chip and the regular chip and one an adva advanced chip . Pricing is a factor for us , that's why we'll go for the regular chip . So are there any issues where we place this this chip

to make sure you can actually hear the the speaker from the outside of the banana ? Uh , so we can have it at one of the boundaries so that things are slightly better . or as hearing is concerned , we can have some gap at some place , so our T\_V\_ remote can have little extra things to support additional devices like V\_C\_R\_ D\_V\_D\_ players which are usually attached with the T\_V\_ , It depends , if we like , if we are concentrating on like a fruit design , then maybe maybe we wanna sell a collection of fruit , you know , like a different fruit for each device . So you're having the basis station and there is a button , if you press that button wherever the remote it'll start beeping so you know where the remote is . Uh I think that's a pretty handy feature . Yeah but I'm a bit worried about the budget . basis station is nothing more , just it's a wire which is coming from the main cable and uh you're having one socket on which the thing sits . L\_C\_D\_ has already been ruled out , A\_S\_R\_ has been ruled out . I'm just wondering actually , 'cause , you know , I this whole fruit thing with the banana , it's um it seemed like it first seems a bit kind of uh niche , like only a few people would really want a banana , but what if it was kind of uh a stylised banana ? You know , rather than having it kind of you know yellow and really looking exactly like a banana , you could make it kind of silver . If you make something that looks like a banana it should have the colour of a banana . maybe like still in the shape of a banana . Um , but you know , just maybe maybe not exactly the same texture as a banana Before before st before ending the meeting I'd like to to draw some sketch about the pro future prot prototype . So we need to take some de decisions about um about what we're going to do . so we're going for a stylish banana shape . We'll have a base station extra uh on the side . Uh , we have a R\_F\_ for um for beeping for beeping . So we that means we need a button on th on the on the basis . and your tur turbo turbo uh button . Yeah , which I think it's it's probably best actually on the on the underneath of the the device , And and you have two wheels . Oh we need a we need a power um on off switch as well . Well , I dunno if the traditional user is gonna buy a a banana remote But you know our targets are very high , means fifty million Euros is the profit which we want make . You have to uh work on the look and feel uh design and you have to work on the user interface , in fact you two you have to work together to model the first uh f first prototype . Uh Marketing Expert uh have to go to product evaluation .

## Complete Meeting Transcript

Afternoon. Yeah, we had falafel. Mm-hmm. Spongy means it it's like sp But what's your suggestion how we can have some shape like that on the remote? Mm-hmm. Means buttons are in the shape of fruits, buttons are in the frape shape of fruits or something, apple, banana, something like that. Mm-hmm. Mm-hmm. That we can discuss afterwards. Banana. Mm-hmm. I don't th it will be rolling a lot. But it's just a speaker right? It's not a microphone. Mm-hmm. Actually I'm not reading microphone there, so that's why you can all have conversation, it just to speak to you. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm, mm-hmm. Okay. Mm-hmm, mm-hmm, mm-hmm. In-house. Mm-hmm. Mm-hmm, mm-hmm. Mm-hmm, mm-hmm. Mm-hmm. Yeah okay, let's go ahead. Stable thing, that's right. To have, mm-hmm, mm-hmm. Mm-hmm, mm-hmm. Mm-hmm. Mm-hmm. Communicate. It's one way. Mm-hmm. Mm-hmm. Yeah, that's right, yeah. So it's a speech synthesis kind of thing, something has been uh

stored and it's just uh spoken out. Mm-hmm. Yeah. That's right. That's right. So this is going to be about the component design. So first thing is we need power source for the remote control. So I was of the idea that we can have two kind of power supplies, one is the usual batteries which are there, they could be chargeable batteries if there's a basis station kind of thing and on top of that we can have solar cells, when the lighting conditions are good they can be used so it'll be pretty uh innovative kind. Then uh we need plastic with some elasticity so that if your if the remote control falls it's not broken directly into pieces, there should be some flexibility in t Yeah. So there should we should think of something like that and then it should be double curve. The s science for the ease of handling and there are some other issues why we need double curve. Then controls for the traditional u traditional users we can have the push buttons so that they don't feel that it's an alien thing for them. Double curve is, you have curves on both the sides if I'm right. So it's symmetrical kind of thing, whatever it is. So, it could be curve, so it could be convex, conve concave, depending on what what we want. So there are flats, there are single curve and there are double curves. These are the three things, and there are different materials, with plastic you can have double curve but with uh certain other materials we cannot have double curve. So there there was uh there were many other materials like wood, titanium and all those things, but plastic is I think is the most appropriate one, it'll bring the cost down and anyway it's Wooden cases Mm-hmm. Mm-hmm. Is it an e apple which has Banana is more handier as compared to this I think, and to capsicum. Okay, so push buttons for the traditional users so that they don't feel they are alienated, just and a scroll button with push technology for channel selection, volume control and teletext browsing. These are the three scroll buttons which are already available with us in the company and we we can go ahead with that. Yeah, we can go to the next slide. Then uh there are different kind of chips, one one is the basic chip and the regular chip and one an adva advanced chip. So we can have regular chip for control. Pricing is a factor for us, that's why we'll go for the regular chip. And uh regular chip supports speaker support, so this functionality could be used for tracing the mobile phone which has been misplaced. It could be a beep kind of thing. Yes, yes, that's right, it's it's onto the chip, most most probably, not not hundred per cent sure about that. That will be the volume control I think which which a user shou it it should be already pre-defined. It should be whatever will be the case, the chip is always going to be sitting inside. Mm-hmm. Uh, so we can have it at one of the boundaries so that things are slightly better. As or as hearing is concerned, we can have some gap at some place, so that That's right. Okay. Yeah. So these these were the componen

t selection and these things. We can go to the next slide. And uh these were the findings which I I saw with the web web, that user wants to have control more than one device wants to control more than one device from the same remote control, so our T\_V\_ remote can have little extra things to support additional devices like V\_C\_R\_ D\_V\_D\_ players which are usually attached with the T\_V\_, because users are like this and they don't want to have one remote control for everything, so with this additional little, we might be having slightly better market for us. Mm. Of fruits. Mm-hmm. Remotes objects, okay. And uh as well as I could see on the web the scroll button is becoming really uh hot thing s and we should have it on the remote. So you're having a basis station. Okay. Your usually your remote sits on that. So you and it's that's why it can have chargeable batteries. Now let's say Basis station is with the thing. It's like a telephone handset is there and the basis station for the telephone hand set is there. So now what user gets additionally he doesn't have to buy batteries, they're rechargeable batteries, so over the period of cor time he'll recover the cost. So you're having the basis station and there is a button, if you press that button wherever the remote it'll start beeping so you know where the remote is. Uh Mm-hmm, mm-hmm, mm-hmm, mm-hmm. Uh this is basis station is nothing more, just it's a wire

which is coming from the main cable and uh you're having one socket on which the thing sits. That's right. But all these things are usually in-house so we don't have much problems. So component cost is going to be the least. Anyway, we are not using really advanced technology, L\_C\_D\_ has already been ruled out, A\_S\_R\_ has been ruled out. So it's the basic thing but very trendy and very user-friendly. And Mm-hmm. A yeah, otherwise it'll be mis means you don't get b any feeling then. It's neither a banana nor a And uh going to the last slide. Okay. Okay. Okay, so. Anyway, users'll be so the findings is users'll be very interested in our locator device to find their misplaced remotes. So that was very I thought it's a very good suggestion by everybody. That's it. Yep. Mm-hmm. That's right. The basis station. That's right. There's less space on this to put with the buttons. Uh what about a The base station. Right. Mm-hmm. Yeah. That's right, yeah, we need that, yeah. Basis station. Yeah, yeah. Turbo button. Okay. Uh for the remote? Remotes don't have power on off switch. Okay. S no, that'll be controlled by the those buttons'll be there already, yeah. Means on the remote. Because remote is going to have both the interfaces, scroll as well as buttons. They are not going to cost you much, everything is in-house and now you don't want the traditional users to be apprehensive of this. Oh, yeah. That's that's another issue which I didn't think of. But you know our targets are very high, means fifty million Euros is the profit which we want make. Twenty five. Twelve point five is the profit on one. Uh forty th four. Point point four million? Point four million. In the market. Mm-hmm. For the future prototypes. So meeting's over? Okay. Okay. Okay. Thank you. The problem is after all this meeting there is Okay? Good afternoon. Hope you have good lunch. Oh. Nice. And you? Okay. So today is um our third meeting. It will be about the conceptual design uh. If I come back to uh the minutes of the last meetings um. We decided not to go for speech recognition technologies because of some reasons and we are not decided about u the use of L\_C\_D\_ screen on on the remote control because of costs. So maybe we cou wi will be able to clarify this this question to today. Uh at the end of the meeting we should take decision on that point. So I hope uh that your respective pr presentations uh will help us. So each of you have some presentatio presentation to perform um who starts? So marketing. So you are you saved your y your presentation somewhere? So

you're four? Which is trend watch. Okay. Mr Marketing Experts. So Mm-hmm. Next slide? Yeah. Okay. Mm. Drawings of bananas. Uh-huh. Well so this is in the next slide certainly. It's not? So maybe you maybe you can display a banana on the L\_C\_D\_. Apple for channel one. Okay. That's a question. Maybe too long. A banana. Okay. Yeah and you you you will not have pla enough a lot of place to put a L\_C\_D\_ on a banana also. Well, you're the Marketing Expert you should tell us if it is too much or not. So So you you you suggest to go f Okay. S so you're simply you're simply looking s to a remote control that looks like a banana with few buttons with only a few buttons. Okay good. So maybe you can go ahead? Okay. Thanks. Um. Okay, I'll give the floor. So you are User Interface guy. So you're three? And it's this one. Go for it. I there's something that I unclear really understanding. Is this a technology that recognize keywords speech keywords? And it's just to, it's just to playback something? Yeah yeah. So this is not s really to do to to do control. Yeah. This is just more like a poi pois yeah. Yeah yeah. So it it's c uh it it is a uh uh easy uh a fancy thing that you you can bring to we can bring to the remote control that will not have any uh yeah comp completely pointless for the inter for from the interaction point of v point of view. Okay. Yeah yeah. So this is so this is this is much more than tak taking this technology, bringing it to the remote control and using it. So this is out of discussion. So if if it is something that you can we can bring easily and to put it into the banana remote control No this is mm banana-bando, yeah. Uh then it could be cool yeah. Okay. Okay. It doesn't look like a banana at all. Yeah. But you you can fit i you're saying now you can fit it to Yeah. Mm. It's enough. Switch on. Yeah.

Okay. So it looks like we're going completely to forget about the L\_C\_D\_ thing. I think that No we can we can't use that. We can't use that to to comman co communicate, it's just a thing No. Yeah. Yeah. A good good good thing. You want to go to move to your slides? You're finished? Yeah I think so. Mm-hmm. Mm. Exactly yeah. Oh, good idea. Very good. Okay, let's move on. So you're two? Okay. Mm-hmm. Yeah. Yeah. Mm but i but there is no elasticity which could be Yeah but the components inside. Yeah. Very too expensive to do. And also uh Yeah but it's more easier to do a banana in plastic than uh in wood. Well it look like it looks like you are all targeting that yeah? Yes it is. Yeah? Pumpkin. Green. Um um um, yes I see. Pep pepperoni. Poivron. Uh pepper. But um they do d Yeah. Yeah. It's not re it you you think it's really fancy and fun? You think that young people that are Yeah. More than a banana? Yeah. It's kind it's kind of it's more uh it's really ergonomic, it's fit in the hand and you've a lot of surface to to put the controls. Okay let's move on. So time is running, let's move on. Okay. S objects. Crazy objects. Okay. Okay, good. Bu it's it's. You s you you thing. Yeah. Mm-hmm. You think that yellow it's kitsch. If you make something that looks like a banana it should have the colour of a banana. O otherwise Roughly. Yeah. Okay. Let's move on. Uh uh yeah. Before before st before ending the meeting I'd like to to draw some sketch about the pro future prot prototype. Go for it. Well no, not not you, you can finish your slides before Mm okay. Okay. That's all? Okay, so mm so well done for the presentations. So we need to take some de decisions about um about what we're going to do. So I I propose that you go to the whiteboard and we're going to report all the ideas we had we had during this these presentations just to draw some sketch about what will be the prod final product and uh where Superman go banana and uh uh extra func functionalities such as wheels, um the speaker unit um well not in order not to lost the um the device, I do I don't remember you call it? Basis station, yeah. Uh so um so we're goin

g for a stylish banana shape. Yeah, right. We I if it i if it has really the model shape of a bana you could the the starting is good but it could it should have more the shape of a banana if you want to point really a at the thing. If you don't want to to to do that movement which is which is difficult if you don't have to do it in fact, it's better. So ti time is running, we have to we have to we have to to move forward. So let's skip to uh this uh this this this idea. Yeah. So we have this. We have a a basis um, how do you call it? A base station. We'll have a base station extra uh on the side. Yeah. Uh, we have a R\_F\_ for um for beeping for beeping. We need b R\_F\_ to beep. So we that means we need a button on th on the on the basis. Basis station, thank you. Can you go quickly please? Okay. So we are going to add uh also um you as you suggested the whee some wheels to control the volumes and channels and your turbo turbo button. Yeah, on the th yeah, maybe here. And the and the wheel a a at the level of the thumb for instance. And and you have two wheels. Okay right. Good. So no L\_C\_D\_. Okay great. Um. Very good. Yeah. Oh, just the switch, no f not for the T\_V\_ for the T\_V\_. Uh so you On the side. Twenty five. Yeah. So. Well. No. Time is running, we have to close the meeting in a few minutes. So, okay, the next step, you can come back to your seat. The next step is to go for to f is to go to uh to building a prototype, based on this, okay? So next meeting you guys have to prepare the followi things. You have to uh work on the look and feel uh design and you have to work on the user interface, in fact you two you have to work together to model the first uh f first prototype. Uh Marketing Expert uh have to go to product evaluation. Okay? It's too difficult. It's not a possi it will not be possible to implement it for the next prototype, so t it's in the next prototype so let's skip it. Yeah, maybe, for the n if if it works well, we'll go for uh an orange one. Yeah yeah, honour the fruit. Okay. Thanks very much. We'll see n next meeting. Bye. Thank you. Okay,. Yep. Four, yeah. Yeah that's me. Uh. Well I investigate the preference more d I investigate deeper the preference of the users. Uh so the the current investigation th uh th uh

sorry the current the n current trends? Yeah? Okay. Okay. Well wha what I found um can you Yeah. Thank you. What I found in order of importance from less to more important is that people want an easy to use device. After they they want something new technologic technologically speaking, but the most what they what they find more more interesting, more or more important it's uh a fancy look and feel instead of uh instead of the current the current trend which was f the functional look and feel. So now more more cool aspect, ma more a cooler aspect uh rather than a device with many functions and many buttons with instead of i instead of ha of a device which can do many things, a device which is pleasant to to watch, to see. Uh also Well in in Euro in in Paris and and Milan the in Paris and in Paris and Milan the the current trend of uh of clothes, furniture and all this all this fashion it's it's fruit and the the the theme is fruit and vegetables. And also in the in the U\_S\_A\_ the the current the mor the most popular feeling it's it's a spongy. Spongy means eponge? So maybe we should we should think in in this direction, so Fruit vegetables is the the new have you seen the last exposition of clothes in Milan? Yeah, I I didn't miss an I didn't miss and I saw that the fruit, there are many fr pictures of fruits and vegetables in the clothes. No no, not not yet, not yet. Yeah, yeah. So te textu textures, yeah. Yeah. Vegetable textures and all this kind. Uh yeah, yeah. Uh no no, it's not. It's And Um. I ha I haven't thought of any particular fruit, but the general aspect of the of the remote control may may could remind some kind of vegetable, some kind of instead of vegetable, some natur

mm uh natural object or something. But yeah it it depends on the Yeah maybe the shape the shape No, not n not not too much focus, not too much focu not n not too s not too similar to a fruit because next year the ten the trend the trend will be different. So we shouldn't be at re really attached to to the trend but For instance, yeah. African or as an elephant? Well ma maybe we we should further specify what target are we focusing. I think in my opinion we should focus on on young people because they are more open to new devi new devices and also yeah according to the marketing report ninety p ninety five percent of young people was was was able to to buy a a n a cooler remote control. What? What? Yeah? Uh Is the new trend of the No I think we we should think about a a shape with it a device with a shape of some Yeah. Don don't you think we can find uh the shape of a fruit which is handy to use? Or m Maybe. Um Yeah. Yeah but I li I like your idea that we shouldn't have a lot of buttons b buttons so Uh do you want a an L\_C\_D\_ with twenty five Euros? I think Well, according to the to the report people are more interested in in a fa fancy look and feel and in a technological inno in innovation, so, I will give more importance to the look and feel than rather than the new inputs and also it's I'm not convinced about this L\_C\_D\_ because you need uh internet connection, you need more things, it's not just buying a new control re remote, you need buying control remote, buying uh more things. It's not so simple. For instance, yeah. Yeah for for for given an an example yeah. Yeah no, it's what I already said. Yeah but you can u Yeah but the can we use it for saying okay, channel fifty, channel twenty? M Mando. Banana-mando yeah. Looks like a tr look likes a a tro a tropical fruit. Yeah. What's a turbo button? It con it controls the speed? Yeah. So sounds crazy. I like crazy ideas. Yeah, of course. I I think we could use somehow the s coffee machine dialogue interface or so. You we can? We can't. Yeah, but we can say channel twenty five. No? It's not a lot one hundred templates, it's not Ah, it's designed for a cof okay. Is it design for a coffee machine? Okay. Yeah. Maybe you could ask your the you could ask the engineering department if we can Yeah. Yeah. Actually I was thinking that the the shape of a banana is not it's not really handy. Uh I don't know the name o o in English uh This it's not a fruit it's a vegetable. Green. And you put in the salad. Um Oui c'est ca Pepper. And it's al it also suits with the double curve for easy of No, I mean in a I'm sure it's fun. But banana is not so handy, I think that's handier. Yeah you're right. I think that would be funny at the beginning but after one month you will be tired of be

surrounded of fruits. No but I think just one fruit to control everything. A power fr a power M a Mando, a Supermando fruit. Actually I I didn't understand very well this trace speaker lost control. So you you have to buy two things, the banana and the basis station. Yeah. Yeah but I'm a bit worried about the budget. Yeah. No, I I Maybe li like that. What about what about this shape? More or less. Yeah, but how many buttons do we need? What a What about Four millions? What about a I wo what about adding the this word spotting, keyword spotting recognition saying volume up volume down? It's too difficult but people like innovation and that's really uh innovative and I don't know if it would cost a lot, just a few five words. Okay. Plus plus, okay. Maybe objective banana? Thank you. Hi. Uh, yes, I had something similar but non-vegetarian. Yeah. What what do you mean by fruit and vegetables and spongy? What you mean clothe No, I missed that one. Oh, they're okay so they're not like dressed as a carrot they just have like pictures of fruit on, okay. So we're not gonna have a remote control in the shape of of a banana, just maybe Okay and So which fruit are you thinking of? Oh, so you want the remote control to be the

shape of a fruit, or you want just some kind of like fruit logo on the So something that looks half like a fruit and half like an elephant. But okay, I'm not, I'm not really sure if uh that would really appeal to everyone though, maybe just to fashion gurus, like maybe just like a little bit n a little fruit picture somewhere in the corner, but I don't know about uh I dunno how ergonomic a, an orange is. To fruit? But is it uh is fruit cool? Is fruit cool? Well I guess, you know, Apple has the iPod so, imagi just 'cause they have an apple on their on their product, doesn't mean fruit is cool. Okay, but it has to be easy to uh to use though and to hold you know, you don't wanna pear or a watermelon. Well, probably the only thing is a banana that I can think of, a cucumber. I dunno. Maybe. Too green. So, but I mean you also have to you have to also have, fit r all the buttons and you know. It's, it The thing is you have t normally with um with buttons, they have to be at some point attached to a circuit board so if you're gonna have things like on a cylindrical kind of device it may be difficult to kind of to build. Yeah. Well, this is Okay. Yeah. Yep. Yep. Okay. So. S next uh slide. Okay. So I received an email um around lunchtime letting me know that the brilliant minds at our technology division had developed an integrated programmable sample sensor sample speaker unit, um which is a way for you to have a conversation with your coffee machine and or remote control. It's no, what it is, it's it's very It has a has a microphone, has a speaker, it's got a little chip and it allows you t Well, it's a sample sensor sample speaker. Sample sensor sample speaker. It means that it can recognize, it can do like a match on a on a certain phrase that you speak and then can play back a phrase in response to that. But uh there's no kind of um understanding of the phrase. So, I mean, you know, I guess you could build that in, you could you could link the the recognition of a certain phrase to some function on on the remote control. But basically the thing is, we have this technology available in-house. So, um but the thing is obviously there's still gonna be a cost if you decided to integrate that because you still have to pay for the c production of the components, so um it it but it basically means we c we can kind of consider this from uh you know uh a theoretical or usability kind of viewpoint without worrying too much about you know how to develop it because we have this already done. Whilst you know, some people might get annoyed if we uh if we just dump it, It's it's no, well, it's it'll recognize uh I guess keywords, but you know keywords in a certain order like a phrase. You train it for a certain uh, for a certain phrase, you say the the example they said that they have uh up and running with their prototype is um well they've actually integrated into the into the the coffee machine that uh that we're producing is, you can say good morning to the coffee machine and it can recognize that phrase and it'll playback good morning, how would you like your coffee? Yeah. So actually that was a bad example, 'cause it doesn't actually ask how do you want your coffee because it

can't really understand the response, so. Only, like, only in the sense that it it can recognize a set a set target kind of word an It's designed it's designed as a fun kind of thing, but I guess you could use it as uh as a way to implement uh Completely pointless yeah. Yeah. Yeah, unless you know, you like having conversation with your remote control. Well yeah, that's the thing, if you can but you have to pro though I think it's a fairly simple design so you would have to record into the device every possible combination, you have to s tr train it to l to learn channel fifteen, that whole thing, not just the word channel and the word fifteen, it doesn't have that kind of logic in it. So Yeah, that would be some development work. Yeah. Banana-mando. Banana-man I

uh I I I don't think it's worth it though, I think it doesn't really add much to the functional design and it's it's not mature enough to use as a speech recognition engine, so Um, yeah. So if we can just move on to the next slide, I've just done a quick mock-up of uh uh some of the features of our potential funky-looking uh remote control Well, you see, I was I was unaware at this point of th of the fruit focus, um, so at the moment it's more of a box focus. Yeah, well, this is actu this could be a genetically engineered fruit that's designed to be you know square so that it packs tighter in the boxes. But um, I've just indicated here, we could have actually two scroll wheels, 'cause I think the scroll wheel is a fairly um key part of, you know, I think everyone has has agreed that it's that it could be quite a useful um thing, so. But I think it's important, you know, to have two scroll wheels because, you know, you want one for for the channel, but you also want one for for the volume, because it's it's the volume i it's, you know it's very handy for it to have uh instant kind of uh feedback uh and response, so. But um, I've also included this turbo button because I think, you know, every design should have a turbo button, and well so this is you know, a unique problem with with televisions is that if you have this scro this scroll wheel for the television, the uh the tuner on the T\_V\_ is not gonna be able to to switch between stations as fast as you can scroll, so you know, the th the person might want to have a uh Might want to be able to scroll past television stations without seeing what's on them, in which case it just waits until you stop scrolling and then, you know, displays that station. Or they might want to scroll and and have a quick glimpse of it, even if it lags behind what they're doing. Yeah, so with this turbo button you can, say, skip over t channels if uh, you know, if I'm if I'm going if I'm scrolling past them and you know, it's um, you could have a little red light that comes up when they press it so they feel you know it's really going fast or whatever. So yeah, that's um, those are the two important uh features I think we need on the remote, but I mean we can discuss about what other kind of buttons we need, um. You know, i it could be, you know, if we if we wanna have like a very cheap kind of device, I mean, we could either consider that maybe we want to sell this as a very, if it's gonna be a banana, you know that's a pretty gimmicky kind of thing that doesn't have that much functionality, it's just you know a couple of scroll wheels and a button cause it's hard to get so many buttons on a banana and it's still very it may even be for most for some people more functional than their current remote, but if they have these scroll wheels, so, um you know, what other buttons do we want? I mean we could have well, I guess you need an on and off switch, but you could you could o you could turn it turn it on by taking the top off the banana maybe, you know, it's kind of like a spy kind of flick thing. That's why you're a marketing guru. Well, that's the thing, as have we decided that we can only spend, uh, twenty five Euro? Well not spend, but you know, charge twenty five Euro. But then you have to have a template for every channel, for a hundred channels, you have to be able to to recognize Mm. Well, I f I think it's probably more than, than our can handle because it's designed for a coffee machine, you know, to say hello in the morning. Well that's its current application, I would presume that it's kind of, they wouldn't design it to handle a hundred things th so. But uh Well I just I just made the point, I don't I don't know if that speech recognition is, you know,

even if we can do it, I think it's not really appropriate for uh television environment. But um I did have one thing from a previous meeting, you were talking about um being able to find the remote control and I was talking about extend

in being able to extend the remote control by having you know, a base station that can control other things as well. It might be useful to have some kind of base station, even if it's just you press on a button on it and uh and the remote control starts beeping, you know, this is a way of finding the remote. Y in that case maybe the maybe the speech recognition the speech thing could be useful just to say I'm here but uh it's probably a bit of overkill if you could just have a a beeping It's speech It's it's speech synthesis and s it's speech kind of, not really speech recognition, but kind of pattern matching, yeah yeah. I guess that fits in with the spongy kind of design philosophy. So, just one second, when you say double curve, what do you actually mean? You reckon you could like draw us a thing on the, on the whiteboard 'cause I'm not sure Okay, but like, kind of convex or concave? Mm-hmm. Okay. Okay. Although, you know, wood could be uh quite a stylish uh option, if you take like, nice quality kind of wood that's got a nice grain and you kind of put some, some varnish on. Well it depends, I mean, you have the outs the wood itself is not gonna break so you don't have to worry too much about the case being broken, it's the inside. Yeah but inside you know you could have you can still have some kind of cushioning that's not visible to the to the user. And I mean you could also, you can have just a very thin veneer of wood as well. That's true, but are we set on the banana idea? It's like a pumpkin or Green. What does it taste like? Ah yeah, is it what's it in French? Yeah, okay, so capsicum or pepper. Yeah. I don't know, it seems a little bit kind of bulky to me, like like with a banana you can have Well But like a banana you can you can be holding like this and have the scroll wheel kind of on top and just roll it back and forth like that, but with uh I don't know how you would hold a capsicum and So is that, when you say speaker support, you mean it just has some output pinned which which which kind of Okay, but the speaker is actually attached to the to the chip in some way, or is just the the signal? Okay. Okay. So are there any issues where we place this this chip to make sure you can actually hear the the speaker from the outside of the banana? Okay. Yeah, but the speaker, if the speaker is actually on the chip, then if it's too far away from the the casing, or if the casing is too thick, then you may not hear the the speaker. Yeah. Yeah. So that's something we have to keep in mind with the actual physical design is to keep the the speaker close enough to the outside. Although, if It depends, if we like, if we are concentrating on like a fruit design, then maybe maybe we wanna sell a collection of fruit, you know, like a different fruit for each device. Cause that, you know, that sometimes people like to collect um you know things that of a similar type. Well, you're the one who wanted to do fruit in the first place. Like a power fruit. Yeah. Well I think that's a pretty handy feature. I think it's kind of people would find that worth it even if it wasn't uh a recharging station, even if they didn't have to buy extra batteries, you know. So Although you do need to include R\_F\_ kind of circuitry in the remote. Okay. I'm just wondering actually, 'cause, you know, I this whole fruit thing with the banana, it's um it seemed like it first seems a bit kind of uh niche, like only a few people would really want a banana, but what if it was kind of uh a stylised banana? You know, rather than having it kind of you know yellow and really looking exactly like a banana, you could make it kind of silver. And um, you know to give you kind of the idea of a banana but without it looking you know completely kitsch. For better want of a better word you know? Well, you know, I don't know how many peop Well they Yeah, like this colour this colour Maybe, you know, maybe like still in the shape of a banana. No, exactly. Exactly. Um, b

ut you know, just maybe maybe not exactly the same texture as a banana and just kind of, you know because the thing is it's gonna be a little bit difficult to make um to give like the texture of a banana

anyway and to k to have the exact shape. I think if you're gonna not be able to do it properly you may as well do it in a stylised way that just looks a bit more kind of, you know, twenty first century rather than sixties or seventies. Okay. Yeah. Okay. Yeah, so, I guess you wanna hold like the way the end of the banana you wanna kind of hold as ma you maybe wanna kinda hold like a gun rather than 'cause you don't want it to point kind of towards the floor. So you know, so if you have like Okay, so So okay, so I guess we need, you know, something that can fit a banana shaped object. Okay, so it's uh Yeah. Alright, so we need uh okay. Yeah. Yeah. Yeah, which I think it's it's probably best actually on the on the underneath of the the device, so you have Yes. Yeah, so you have the thumb kind of here. So yeah, you need one one here and one on on the other side, so you got volume an and channel. And, uh No L\_C\_D\_. Oh we need a we need a power um on off switch as well. Yeah. Yeah. Where? Okay. Well, I dunno if the traditional user is gonna buy a a banana remote in the first place, you know. Y I mean you need to kind of keep it um Yeah, how many of these did we wanna sell? I can't remember, what was Yeah, but how many units did we need to to sell? Four point four million. That's a lot of fruit. Okay. Okay. Okay. Uh. That can be the t That can be like the turbo banana plus plus commando. Okay. Yep. We have to go design the prototype.

# Meeting ID: 98

Data Source: Train

## Executive Summary

The project manager Sebastian opens the meeting. The rest introduce themselves, including Michael the interface designer, Guillermo the marketing expert, and Hemant the industrial designer. The project manager states the goal of the project, which is to develop a new remote control. It should be original, trendy, and user-friendly. He also mentions the three-step project- functional design, conceptual design, and detailed design. Then they take turns drawing their favorite animal on the white board. After that they briefly discuss finances. The remote control's target selling price of twenty-five Euro dollars and will be for the international market. They need to generate a profit of fifty million Euros. The question of whether the remote control should be for a specific device was brought up but not answered. The project manager closes the meeting, telling each group member what he is responsible for and reminding them that they will receive more information by email.

## Complete Meeting Transcript

Okay. Good morning everybody. Oh, everybody is not ready. Alright. Okay, let's go. So, we're here today to to have our first kick-off meeting about uh this new project we're going to tak to talk about in a few minutes. Um so I will be uh Sebastian the Project Manager. Um you are the Okay. Okay, very good. Thanks for being here. Um so let's have a look to the the agenda. So, we are going to go through this agenda uh and mainly first to uh to make to to be used to the tools uh available in this nice and smart meeting room we have here. Um then we'll go to uh the plans for project and have general discussions about it. So, the goal of this project is to uh developed a new remote control. Um it should be original, trendy, and also user friendly. As usual we will follow the the project method um that we are using in the in our company. It is in three step as you know. First the functional design. The second's a conceptual design, and then the detailed design. During each step uh of each design we wi you will work uh s separately, individually on uh your specific tasks and will m we will meet to um to discuss and take decisions about uh what you've you've you did and what uh we will do next. So first, we have to to train ourself with all the um the tools availables in the in this nice meeting room and uh particularly the the white board so uh we are going to go through the white board and take some um s some notes or

do some drawings. So who want to start? Mister. You have one in mind? Okay. Th thank you. Very interesting. Guillermo you want to? It would be very funny for us. Oh. Okay. Thank you. Hemant. Poor elephant. Yes. We have to I have to catch you, sorry. We have to to go through the meeting. Thank you. Yeah we'll discuss a f a fly or do we'll do another meeting abo on elephants. So so another important part of the project is about money, uh and about so about finances. So we should target selling price of twenty-five Euro for this remote control and uh we have um which which would generate a profit of of um fifty million Euros, okay. And we should target the inter an international market. O this is the next topic we have to discuss exactly, so let's go to it. So um we should decide which kind of remote control we want to uh we want to uh we want to go. Should be should should it be um specific remote control to some specific device? Should it be a universal one? And uh etcetera. So um so I'm waiting for your for your inputs very quickly because we have only three three minutes to go. Okay. Okay I think this is more a job to our market person yeah. So it should be the topic of maybe of the next meeting just to to have an overview of this and uh in which direction we should go. So we need to close the meeting. Uh we'll have a new meeting soon and uh so the work every every of you ha have t d to do. So um you have to work on the on the working design, you have to uh work on the technical functions, and uh you have to work on us user requirements specs, alright? Um you will receive some information by emails, i as usual. Thanks for coming today. Thanks. Uh almost. Ready. I'm uh Michael. I'm the user interface designer. Ah well if no one else wants to, yeah. Okay so, want me to draw my favourite animal. Let's see. Well, I don't really have a favourite animal, but um uh I think I have one in mind, so uh I'm gonna about the uh spider because you can actually draw it pretty well in the corner of a white board. The spider has a spider lives in a web and uh it has eight legs, and uh it can move all about the web in two dimensions. Unless it's a three dimensional web which y they have sometimes. There are some spiders that live in like that have like uh kind of a a big ball of a of a web. And uh the other thing is some spiders can actually uh fly like uh they have uh they let out like uh a stream of like the web building material but it's it acts like a parachute so they can actually kind of go and find new uh build a new web somewhere

else. So I think they did this in uh in Charlotte's Web that movie that little uh well it's actually a book first but uh um at the end all the the spiders kinda flew away. So, that's my animal. Maybe it's happy 'cause it just ate someone. So you don't like pink panthers? So is this uh an Indian or an African elephant, 'cause you haven't drawn the ears? Okay. We can discuss that off-line. So could I just ask one question, um is this a stand-alone unit that we're gonna be selling? So it's gonna be you already have a T\_V\_ but you're buying an extra remote control for it or something? Okay, alright. Okay well, so, it seems the the first thing that they've kinda specified is the price like based on how much profit we wanna make, which seems to a kind of a little strange if we don't know what the the product is yet, but I guess if that's if that's the requirement that we need to to design the the product to actually fit that that price bracket so, I guess we're gonna need to find out what's actually you know, what people ar are willing to pay for um what kind of product they're expecting for twenty-five Euro because it seems quite a lot for a remote control, so it's Yeah. Okay. Alright. Hi I'm Guillermo. I'm the Marketing Expert. 'kay I dunno why, but when I was a child I I wanted to be a a panther not a pink panther, or maybe yes. Uh yeah yeah. Okay it's a friendly panther. Yeah maybe. Um. Actually, honestly I I I dunno what's what's his it's be behaviour, I dunno if it's the male who who hunts or it's the female uh, I I I have watched that lions di didn't hunt it's the the female lions who who hunt, so but I like it because it's fast, and it's black as well, so it can he it can hide itself very easily and it's it's it looks like um powerful, strong, uh I dunno. I I watch a a film about a black panther when I was a child and I was in that age when

everything was shocking me a lot. Okay. I like it. Yeah. Good morning. And I am Hemant, the industrial designer. But don't you think it's very difficult to draw a panther? So bad I don't like it. Um sure. Oh yeah. Thanks. This label is coming out once in a while. It's not very strong. Okay. So, not the favourite animal, but I think I'll draw elephant. I'll try to draw elephant. It's a problem. Okay, thanks. Okay so, elephant goes like this, and then it has four feet. I don't know whether there's any dist there should be any distance or not, but I think this is the easiest. And then we have it's trunk. And yep something like this. An eye, cute. Yeah, so and sometimes they have a hump. It seems that uh elephants are pretty friendly and they they have one very important way a different way of walking. So when they walk, wherever they are going to put their first feet, the second feet will always be. When they'll come to that position the second, the third feet will be there. That's the way they walk. And that's very peculiar about them. None of the other animals walk like this. And they are very useful to human beings. At least few hundred years ago when there was no means of transportations or something, or when they had to carry huge um loads from one place to another, elephants were very useful. And they are found in um usually the warm countries. And um they are the biggest terrestrial animal. That's what I know about them. So, that's what I wanted to tell about elephants. There are two kind of uh yeah, they are very different, Indian and African elephants. So Indian elephant is having one bump, I think, and the African have two. And then there's a difference in the trunk of the animals, these elephants who are Indian and So at some for some elephants it's the trunk is having one Do we have some message there? Wind up? Okay, some other time. Thank you. Thanks. Marketing person. Mm-hmm. Thanks.

Data Source: Train

## Executive Summary

Um it's our conceptual design meeting our agenda , I'm gonna review the minutes of the last meeting , then we'll have your three presentations um and then we'll have to make a decision on the remote control concepts , Um these are our minutes from r the functional design . We decided our target group is the focus on who can afford it , and we said it's for all age groups , different um functions of it . Our main objectives were simplicity and fashion . specific functions are something to keep the remote from getting lost , large buttons for the essential functions , a possibility for extra functions , like a sliding a sliding piece and a long-life battery or a charging station . I'd like to do it in this order , first do the conceptual specification of components , properties and materials um and then the conceptual specification of user interface and finally trend watching . Components design . The main elements of remote controls in general , and therefore ours as well , are the case , the buttons , the circuit board with the chip and the battery . uh the options that I've gotten from headquarters about what we can do , um there's there's the shape of a case , we could do a flat sh a flat case , a curved case or maybe even a double double-curved case . I haven't seen any pictures of what this exactly looks like yet , and we can make our case out of plastic , the m the main base will be plastic , but we have all these sort of fashion and technological elements we can add in , wood , latex , titanium , rubber or other coloured types of plastic . for buttons we have um pushbuttons , but we also have scror scroll wheels , which can have integrated pushbuttons , and have an L\_ L\_C\_D\_ screen . or we could go all high-tech Um circuit board and chip we can have a simple one , a regular one or an advanced one , And then battery I think is where things get most exciting . Um we can we can have your sort of basic double A\_ batteries , but we also have these options of um using a kinetic battery , Um so simple movements like pushing buttons would recharge the battery . Or a solar battery , although there are slight um complications with solar batteries as in we can't use a latex case if we have a solar battery . Or um something they only described as the type of battery you find in torches from about fifty years ago , flashlights . Um personal preferences that I was thinking through here's what we've been talking about all through , fashion and simplicity . So if we're going for fashion in our cases , I think that what we're gonna wanna look at is a curved or a double-curved case , probably with a variety of design elements . Maybe titanium , maybe some wood . We're gonna have to investigate that better when I get specifics of the actual materials , And we wanna go for simplicity . Probably pushbuttons , but I'm sort of intrigued by the idea of a scroll

scroll wheel , if anyone has anything And I'm really intrigued by the idea of a kinetic battery . But I think we'd also wanna go for a simple chip or regular chip to keep our costs down . Uh we really only need a regular or advanced chip if we're gonna start using an L\_C\_D\_ . Solar I don't think would be such a good idea , Is double-curved like would be like two hands kind of thing ? I'm not sure . but I'll let you know as soon as I get any pictures . I know if we do have a double-curved case , it can't have any titanium in it . um the weight of these different elements , have you no idea , no idea . Um I'm assuming that a kinetic battery isn't gonna take up that much weight , but if anyone has any specific questions , don't hesitate to email me or something . I'm gonna describe the the concept of the user interface of this device . so we need to determine what the essential functions of the device are We have a number of different choices for a design concept um Uh once we've chosen a concept for it , we can then design the features around the concept , M we don't want lots of buttons , uh complicated features . Here's a fairly simple device . This is an iPod from Apple . Uh you use these four buttons to move around a range of settings on the small L\_C\_D\_ screen . So I think that's that's a good kind of model that we could have . Um here's another example . and I think it looks pretty cool . Uh it's nice and colourful , it's nice and bright . if you're watching T\_V\_ in the dark or whatever , you can work out which button's which I like I like this idea of just having buttons for the features that you use most often . we'd either have a small L\_C\_D\_ display on the device itself , or uh have a menu display that comes up on your television there's no point having a television that you can't tune or that you can't set the contrast , so we need to find a way of including these somehow . So you'd be advocating an L\_C\_D\_ then ? I think that's that's one way to go , Um I mean there are advantages and disadvantages if you have an L\_C\_D\_ display , an L\_C\_D\_ display would have to be quite small , Um it would also have to have uh a kind of backlighting in it , The alternative is to have an on-screen display on your television that you control through your remote control . Uh but I think that you do need to have some kind of function where it's um you have to you can see the title of the show or possibly a description of it . I think I think we're talking menu like contrast and tuning the V\_C\_R\_ or something if I've understood you correctly , rather than menu as what's on . we're gonna look a little bit at trend watching . that was a market investigation on remote controls that was recently conducted , and then also some fashion watchers in Paris and Milan commented on some things that are gonna be going on this year . and right now i d they're saying that currently there's a functional look and feel preference , but that really , over the next year it it that's gonna be switching to fancy look and feel remotes , they're sort of wanting us to remember that the number one thing for everyone is that it's fancy look and feel . And as these are ranked , the top one is doubly important to the second one , which is doubly important to the third one , The second thing that was mentioned as important was the technological innovations . And then ease of use was the third most important , And then the fashion watch talks about that this year's top trend for clothes , shoes and furniture is fruits and vegetables and that there's a preference for spongy , tight material . And so that brings us to my personal preferences . Who wants a spongy remote or one with fruit and vegetable padding . Personally , I don't really think that I want one that's gonna go out of style or go stale , excuse the pun , um in a year , so and if necessarily this whole fashion to technology y edas ease of use is necessarily the right ranking . Also , considering that the research has been carried out by Real Reaction , I'm a little hesitant as to like , how these questions may have been worded , but if we're working for

this company then I guess no matter what , we have to stress fashion the most . Um do you have any ideas how to possibly use these ? Um how to how to use a fruit or vegetable or um or the spongy material at all ? could we make a s like could we make a spongy remote ? If it's latex if it's latexy my understanding of a latex case is that it's in fact hard to protect stuff inside , there's something to be said , I mean we we got that thing earlier from you about um not wanting it to R\_ R\_ repetitive stress injuries and things I'm envisioning more like , you know , the material that you have when you sit on like a bicycle , could we go in fruit and vegetable colours ? um couple main ones being like , I dunno , lemons or strawberries or something . I Is it supposed to be shaped like a vegetable ? Uh like uh I dunno , like uh carrots or something . Or maybe the buttons could be shaped like different fruits . What about the idea of like a round remote ? Instead of like a vertical up and down one . Like in terms of holding it . Like that's a f shape of a fruit . would you think you you do you think you'd be able to hold it ? I love the idea of the wheel like the iPod . or is it li more like a scroll thing ? and you press the centre button , that's that's your all-purpose select button right there . I think why it would be good for us is 'cause like you could have the same wheel sort of effect for like channel flipping and then the other one could be like for volume . I think an L\_C\_D\_ screen might be good in theory , but not as useful in practice . Um I've one more slide before we close , but in that slide is when we need to make decisions about this these kinds of things , Could Could we uh could we have changeable covers like for your mobile ? In different fruit and vegetable colours , and then like the the covers could be spongy latex components concept . Energy , chip on print . can you just explain what that is real quick ? what do people think about this kinetic battery idea ? I think it's awesome . I think it's really cool . as as long as we consider the the cost and the uh how reliable it is , I got a whole bunch of information on how circuit boards are produced . which is chip on print is where the machine prints on the wires and solders it all together for us . Al all circuit boards are pretty much the same , I think . I don't really know what to tell you as far as decisions . I guess maybe if we decided on like a simple , a regular , or an advanced chip , maybe . if we're gonna have pushbuttons , they require a simple chip , but a scroll wheel requires a regular chip , Do we want a scroll wheel , Um I don't think we ne really need the scroll whe wheel . It would be nice for changing the volume , but I don't know how useful it'd be for changing the channel . you really need buttons for changing a channel . We have five minutes left for the meeting , so . and the volume would just be like the same way , forward and backward as I'm just thinking like it would make it much like sleeker sort of looking . When you get on the on-screen menu of all your functions that your remote could do for you without the buttons and you could have a scroll wheel to go through those menus . I think yeah , I think a scroll wheel would be nice , but it's not necessary . Um Uh I'm kinda liking the idea of latex , if if spongy is the in thing . could it be hard , and then something around it ? I would be more okay with like a titanium actual thing and then maybe like a mobile phone kind of thing . what I've seen , just not related to this , but of latex cases before , is that there's uh like a hard plastic inside , and it's just covered with the latex . Um and probably in colours , maybe fruity , vegetable colours . and we want a curved case , Or a double-curved ? Um And I think if we wanna keep our costs down , we should just go for pushbuttons , For channel surfing I think a scroll an actual like an iPod's kind of scroll thing would be too fast , I think it might be better to put our money into the stuff like the kinetic battery and the cool case I mean I'm not like hard-sold on the scroll wheel , it's more just to give it a different kind of look , we're gonna go with um type pushbuttons , and then supplements , So we're gonna have like a menu button ,

we're doing an on-screen menu that we can scroll through . uh volume , favourite channels , uh and menu . Pre-set channels I think maybe numbers seems is kind of old-fashioned . finishing the meeting now . Um our next meeting starts in thirty minutes , um you each have things to do , look and feel design , user interface design , product evaluation , and you two are going to work together on a prototype using modelling clay . You'll get specific instructions from your personal coach . Let's go with a simple chip ? Um did we decide on a chip ? but if it's gonna be in a latex type thing and that's gonna look cool , then that's probably gonna have a bigger impact than the scroll wheel .

## Complete Meeting Transcript

Yep. Uh-huh. Don't think so. Jess. Alright, so I'm gonna describe the the concept of the user interface of this des device. Um we've talked about uh the two essential properties of the user interface. We want it to be simple and we want it to be fashionable. Um other we've also got to remember that this is a device that serves as a useful purpose. Uh we want people to be able to use it s as a remote control, so we need to determine what the essential functions of the d of the device are and make sure that we include that we've included all of those and that we actually end up with a device that is going to be useful to people. We have a number of different choices for a design concept um and s that's that's something that that I'll show you some examples of um, but essentially we need to choose how how is this device going to work, how how what kind of model is there going to be for user interaction with this device. Uh once we've chosen a a concept for it, we can then design the features around the concept, making sure that we get all the essential functions in the device and uh the extra functions and the more advanced features. And of course we also have to make it look cool. So basically, that's what we don't want. M we don't want lots of buttons, uh complicated features. We want something that looks nice and simple. Here's a a fairly simple device. This is an an iPod from Apple. Um I think the main thing to notice about it is it just has four buttons. It's very minimalistic in its design. Uh you use these four buttons to m to move around a range of settings on the small L\_C\_D\_ screen. Um the thing I like about this is that it's very very quick to access the main features. Uh you can just about make out uh that the button three buttons are uh previous track, next track and play pause. They're the main the main features of the iPod, the things you will use a all the time. Um then if you want to do anything more advanced, you go into the little menu on the L\_C\_D\_ screen and you use the buttons just to scroll around and and find the more advanced features that you want. So I think that's that's a good a good kind of model that we could have. Um here's a another example. This is uh it's an interesting idea and I think i it looks pretty cool. Um it's certainly got novelty value. Uh it's nice and colourful, it's nice and bright. Uh it's also something that you can kind of feel your way around. The buttons are are different shapes and and you can sort of yeah if you're watching T\_V\_ in the dark or whatever, you can work out which button's which and basically, yeah it's ith it's fun. So I I like I like this idea of just having buttons for the features that you use most often. So you'd need a few buttons to select your favourite channels. I mean most people, when they watch T\_V\_, they have two hundred and fifty channels on their T\_V\_ and they watch of 'bout four of them at the most. So, you have buttons for your favourite channel, changing the volume, which is something you do all the time when you're watching T\_V\_, and the button to switch it off, in case you get bored. Um other features, things like adjusting the brightness,

tuning the T\_V\_, uh I don't know what else you do with a T\_V\_. Um but these are these are all necessary functions. Uh you can't have a t there's no point having a television that you can't tune or that you can't set the contrast, so we need to find a way of including these somehow. Um and one other suggestions I'd make is to in is to include in a menu system, a bit like on the iPod. So we'd either have a small L\_C\_D\_ display on the device itself, or uh have a dis a menu display that comes up on your television and can b be controlled through the device. And that would allow you to access access the advanced features uh whilst keeping a very small and simple set of buttons for the features that you use most often. I think that's that's one way to go, yes. Um I mean there are there are advantages and disadvantages

ges if you if you have an L\_C\_D\_ display, it's it's nice, because it's it lets you just sort of sit there and sit and control your television from your armchair. There are disadvantages, an an L\_C\_D\_ display would have to be quite small, 'cause we're we're I well we're I assume we're gonna be making quite a small device. Um it would also have to have uh a kind of backlighting in it, 'cause you ten you tend to watch T\_V\_ in the dark, but you need to be able to see your L\_D\_D\_ L\_C\_D\_ display. The alternative is to have a an on-screen display on your television that you control through your remote control. Uh a bit like a bit like how they have these um digital boxes where you you press the buttons and it comes up with your this thing of watch lo what's on each channel. I mean that that's also a good idea. It's it can it does have it's problems as well, if you've got a small T\_V\_ and you're sitting on the other side of a room, it's hard to read the little text that comes up. Uh but that's a that's a design decision that we can make. Yeah. Yeah. Yeah, that that would be one of the features, yes. But it's it's it's something to bear in mind is that if we put a display on the remote control the c uh communication is one way, so you can't have the televisions and information back to the remote control, at least I don't think you can. Um I'm not sure. Is that going on? Okay. Uh that should be alright, actually. A kind of thing that Yeah. Yeah. Yeah. I Is it supposed to be shaped like a vegetable? Uh like uh I dunno, like uh carrots or something. Maybe, or Kind of like a potato. Yeah. Depends. When you when you use a remote, do you press the buttons with your thumb, usually? Or your fingers? Or maybe you want something that's shaped like a mobile phone, so you you hold it in one hand, and you press the buttons with your thumb. Yeah. Maybe. But if you've only got like four or five buttons anyway, then it's it's not so much a problem, perhaps. So you hold it in one hand and you press you press the buttons with your thumb and And you find that works quite well? Is that The button on an iPod, is it what is it, is it just four buttons or is it li more like a scroll thing? Right. Oh, I see, right, yeah. Oh, okay. Yeah, that's quite a good design. Yeah. I think it could be difficult in practice, yeah. Also z yeah, 'cause you would be z looking down at the L\_C\_D\_ screen, than back up at your T\_V\_ and people don't wanna do that. Like, to make it different fruits. Yeah, it's possible. I think maybe th the packaging, it should be like a lemon and the the packaging is like the peel. So instead of opening the box you just kind of peel it, and the remote control's inside. Don't know. Yeah, um I think it's good, as as long as we consider the the cost and the uh how reliable it is, but as far as I know, the technology is good. Al all circuit boards are pretty much the same, I think. Uh it's fairly fairly standard. Um I don't think we ne really need the scroll whe wheel. I mean it might be nice for changing the volume. Uh but I don't think it would really work. Yeah, you really need buttons for changing a channel. Yeah. Yeah. Yeah. I think yeah, I think a scroll wheel would be nice, but it's not necessary. Um Yeah. 'Kay. Yeah. Yeah. Yeah. Um Yep. Um And I think if we wanna keep our costs down, we should just go for pushbuttons, 'cause then we can have a a simple chip and it's simpler, it's it's cheaper to make pushbuttons than it is a scroll button. So in terms of uh in terms of uh economics it's probably better to have pushbuttons. Yeah, yeah, it's uh it's it's fairly simple. Yeah.

Yeah. Interesting. Yep. Uh what do you mean by supplements, exactly? Um Yep. Yeah. Um in Yeah. On off, uh volume, favourite channels, uh and menu. Yeah, yeah about yeah like yeah, a bit like radio presets. Um Uh we wouldn't even need the numbers. I think maybe numbers seems is kind of old-fashioned. Yeah, yeah, you can just and you need some kind of, I dunno, sort of up d

own kind of button, but the volume control could double for that, for example. Cool. Yep. Clay. I wasn't expecting that. Mm yeah. Okay. That would be me. Alright. Well. Alright. Um I'm very excited by this one actually guys I uh had a lot of fun doing it. Components design. This is where you look at what does it take to make a remote control and what should we make our specific remote control out of. Um. So, we need to examine each element separately, but we're designing a full thing, so you wanna keep it integrated as a whole. The main elements of remote controls in general, and therefore ours as well, are the case, the buttons, the circuit board with the chip and the battery. These are all things that we had sort of addressed before, but I'm gonna take each one a little bit separately here as we figure out what they should be made of and what they should look like. The case, uh the options that I've gotten from headquarters about what we can do, um there's there's the shape of a case, we could do a flat sh a flat case, a curved case or maybe even a double double-curved case. I haven't seen any pictures of what this exactly looks like yet, just keep that in mind, but these are the options that we have from manufacturing and we can make our case out of plastic, the m the main base will be plastic, but we have all these sort of fashion and technological elements we can add in, wood, latex, titanium, rubber or other coloured types of plastic. That would be our case. Um buttons, for buttons we have um pushbuttons, which is what Real Reaction uses the most often, but we also have scror scroll wheels, which can have integrated pushbuttons, or we could go all high-tech and have an L\_C\_D\_ screen. Um circuit board and chip we can have a simple one, a regular one or an advanced one, depending on what our other needs are. And then battery I think is where things get most exciting. We're talking about long-life batteries here. Um we can we can have your sort of basic double A\_ batteries, but we also have these options of um using a kinetic battery, like are used in high-tech watches, where you just have to move it a little bit to get it to power up. Um so simple movements like pushing buttons would recharge the battery. Or a solar battery, although there are slight um complications with solar batteries as in we can't use a latex case if we have a solar battery. Or um something they only described as the type of battery you find in torches from about fifty years ago, flashlights. Not quite sure what that is, but that's the description that I received, so that's what I'm passing on to you. So those are our options. Um personal preferences that I was thinking through here's what we've been talking about all through, fashion and simplicity. So if we're going for fashion in our cases, I think that what we're gonna wanna look at is a curved or a double-curved case, probably with a variety of design elements. Maybe titanium, maybe some wood. We're gonna have to investigate that better when I get specifics of the actual materials, but that's sort of what I have in mind. And we wanna go for simplicity. Probably pushbuttons, but I'm sort of intrigued by the idea of a scroll scroll wheel, if anyone has anything any ideas on that? I mean I know the iPods and things right now have touch scroll um buttons which are exactly like what they're describing, so that might be something we wanna look into. And I'm really intrigued by the idea of a kinetic battery. Solar I don't think would be such a good idea, because how often are you sure that your remote control will get a certain amount of light. But this idea of the kinetic, that you don't have to replace, and that a simple just shaking it around will make it work, I think that that m would be a very interesting thing. But I think we'd also wanna go for e a simple chip or regular chip to keep our costs down. Uh we really only need a regular or advanced chip t if we're gonna start using an L\_C\_D\_. So I

think we want to be aware of not making things overly technological if they don't need to be, 'cause that'll keep our manufacturing price way down. That's what I have for options. Um I'd appreciate anyone's input, but that's what I'm seeing for the future of the the look of this thing. I'm not sure. I haven't received any specific visuals of this yet. This is what I'm sort of Yeah. I'm not sure, but I'll let you know as soon as I get any pictures. I know if we do have a double-curved case, it can't have any titanium in it. But the titanium, they were quite they're marketing quite hard to us as being used in the space programme, so that could be quite interesting. Space-age remote. Just all things to keep in mind. Yeah. That's about all I have to do, guys. I hope I didn't go through that too quickly. Yeah, n no idea, no idea. Um I'm assuming that a kinetic battery isn't gonna take up that much weight, and that a titanium is very light, I know, um but other than that's really basic, I mean, that's all I have gotten so far. Alright? Any other questions? No? Okay. I have save this in the uh shared projects, if anyone wants to look and I have c considerable notes on the topic as well, if anyone needs any more information. Uh Just in my notebook, but if anyone has any specific questions, don't hesitate to email me or something. Alright? Uh I guess I can I know. G oh, geez. Hmm. Hmm. So you'd be advocating an L\_C\_D\_ then? Okay. Mm-hmm. Right. Right. Okay. Mm-hmm. 'Kay. Well Are you are you tak Yeah. No, I think I think we're talking menu like contrast and tuning the V\_C\_R\_ or something if I've understood you correctly, rather than menu as what's on. Oh, good point. Yeah. No signal. Oop, there we go. Okay. Mm. That there's all kinds of scope for imagination in that one though. If it's latex if it's latexy Um, mean An uh I if th my understanding of a latex case is that it's in fact hard to protect stuff inside, but that it's covered with the latex, which is spongier and softer on your hands. It's there's something to be said, I mean we we got that thing earlier from you about um not wanting it to R\_ R\_ repetitive stress injuries and things and and Yeah, something grippable, I mean we don't we don't we don't wanna go spongy, maybe. Yeah. Mm-hmm. Yeah, I think that given the list of materials I w I was forwarded it's that seems doable. could we go in fruit and vegetable colours? We could colour-co-ordinate them, li The buttons could be fruit-shaped. Oh well it's quite easy to s shape thing like carrot isn't it? Or maybe the buttons could be shaped like different fruits. be yeah. It'd be harder to f bu uh buttons I think. It'd be harder to press button. Um I Yeah, that's ts how I tend to do it. No just thumb-sized. Jus Yeah. That's true. Right. I When I'm when I'm pressing buttons on my iPod, that's how I do it, hold it and press the four. Yeah. Yeah, or in and use my thumb or my pointer finger on the touch scroll wheel. Yeah It wel well yeah, it would I mean each version of it has been a little bit different, but Oh yeah, you had one of the in-between ones, when they weren't doing that anymore. Ts and you press the centre button, that's that's your all-purpose select button right there. Since it's the one in the centre that's not marked, yeah. Yeah. Uh uh t Yeah. Hmm. Yeah. Yeah, I think an L\_C\_D\_ screen might be good in theory, but not as useful in practice. Yeah. Right. Um Oh we probably have to get going, don't we? 'Kay. Could Could we uh could we have changeable covers like for your mobile? In different fruit and vegetable colours, yeah. Exactly. And you could co-ordinate with your house or whatever. All these options. Ooh. Oh. Yeah. Mm. Options. Uh-hu oh, oh yes. Right, I had sort of skipped over that hoping it wouldn't get be necessary but um Alright, so um decisions, what the okay deci decisions on energy I'm thinking is based on the battery. Um I dunno, what do people think about this kinetic battery idea? Am I Yeah. Yeah

. Right, I haven't gotten any yeah, any more information on cost other than it's more expensive than a regular battery, but um but if we're using a an i a cheaper chip, then it'll even out, I think. Um circuit boards. Um yeah, I got a whole bunch of information on how circuit boards are produced. They're they're thin fibreglass with copper wires etched on to them, and di I think they're quite easily printed on by machine, which is chip on print is where the machine prints on the wires and solders it all together

for us. I don't really know what to tell you as far as decisions. I wasn't really given any options, I was just given that this is how they're done. Um yeah, I can't really tell you. I can I can tell you a whole lot about how it works. But I don't know any decisions on Yeah. I'm sorry, I did f Yeah. Right. Well okay, here's the here's the thing on the chips that I that I got. Um simple, regular, advanced chip on print. The chip on print includes an infrared sensor, so we don't have to worry about that. Um, 'kay, the pushbutton if we're gonna have pushbuttons, they require a simple chip, but a scroll wheel requires a regular chip, and an L\_C\_D\_ requires advanced. Do we want a scroll wheel, or do we just want pushbuttons? Oh. Yeah, th it'd be it'd be handy for going through if there was an on-screen menu of your channel choices, than you can scroll down on the scroll. Yeah. Yeah. Yeah. Hmm. F or for all those secret functions? When you get on the on-screen menu of all your functions that your remote could do for you without the buttons and you could have a scroll wheel to go through those menus. Right. So we could either go with a simple or a regular chip, depending and maybe we could table that decision for later. I don't know. Okay. Well, let's think about that while we talk about the case. Uh I'm kinda liking the idea of latex, if if spongy is the in thing. Okay. Uh yeah, everything I've N oh wha what I've what I've seen, just not related to this, but of latex cases before, is that there's uh like a hard plastic inside, and it's just covered with the latex. Not too thick a layer of latex, just enough to be grippable, like bike handles or or anything that you've seen like that. The inside is hard. I don't think we need to worry about protecting the circuit board, I think that that's done for us. Yeah. Yeah. Oh and we want a curved case, yeah? Or a double-curved? Yeah, okay. We don't really know what the difference Good point. Yeah. I say pushbuttons at least unless we get any information but I have no idea how much more expensive a scroll wheel is than than a pushbutton, but it's gotta be some more expensive, so I think it might be better to put our money into the stuff like the kinetic battery and the cool case because Yeah. Oh. Alright. So what are what are our buttons gonna be? On off So like one through five, or No. Mm. Yeah, up down. Ooh. Simple chip. Okay, cool. Clay. Mm-hmm. Okay. I g yeah. Time is it? Okay. Lovely to see you all again. Um it's our conceptual design meeting and it's starting at approximately fourteen twenty five and so we have forty minutes for this one again and so we'll go just after three o'clock. Um okay our agenda, we're gonna do an opening, I'm gonna review the minutes of the last meeting, then we'll have your three presentations um and then we'll have to make a decision on the remote control concepts, and finally we'll close. So opening. Um these are our minutes from r the functional design. We decided our target group is the focus on who can afford it, because we have international appeal and we said it's for all age groups, different um functions of it. Our main objectives were simplicity and fashion. And s um in specific functions are something to keep the remote from getting lost, large buttons for the essential functions, a possibility for extra functions, like a sliding a sliding piece and a long-life battery or a charging station. Okay, now three presentations. I'd like to do

it in this order, first do the conceptual specification of components, properties and materials um and then the conceptual specification of user interface and finally trend watching. Mm. 'kay. Function F\_ eight it. There we go. Mm. Hmm. Mm. Yeah, I wonder Mm-hmm. Just an interesting marketing kind of element. Uh just a real quick question um the weight of these different elements, have you no idea, okay. Mm-hmm. Mm-hmm. Okay. Mm 'kay. Thank you, perfect. Um if you made notes yourself you can put those on our um underneath our oh, uh in your book, then don't worry about that. 'Kay now we're um concepts concepts of user interface. Yeah, um. This one's so much tighter than the other one. Okay. Nope. There we go. Here you are. Mm. Okay. Mm-hmm. Mm-hmm. Mm. I do think that um one of the important features for a remote is seeing a menu and seeing what's on. Um and so like favourite channels is is applicable, but I think th that you do need to have some kind of function where it's um you

have t you can see the title of the show or possibly a description of it. Like I I know I use that often enough. Well if it if it was a L\_ L\_C\_D\_ on th on the remote, I don't know that you could f that you'd be able to see a Okay. Okay. 'Cause that would be more specifically a digital box, mm-hmm. Mm. Okay, now we're moving on to market. Marketing. Eight. Oops, it's not plugged in, quite in well enough. There we are. Mm 'kay. S sweet. Okay, do we have any s some questions for this, let's see um. Um do you have any ideas how to possibly use these? Um how to how to use a fruit or vegetable or um or the spongy material at all? Like could we make a s like could we make a spongy remote? It would be easier on the hands. It's kind of and then it we would have to find a way to protect like the chip and all that, I dunno. But Mm-hmm. Mm-hmm. Mm-hmm. F for sure, or maybe like um couple main ones being like, I dunno, lemons or strawberries or something. Could they be smelly? I don't know. Or carrot shaped, mm. Like large button, that's what I was thinking of, yeah. Might would you think you you do you think you'd be able to hold it? 'Cause I think the reason they're long is yeah. Harder to push. I usually hold it in one hand. Maybe But then the buttons would have to be very small. Don't you think? But I mean in order to get to all of them, you know. They would have to be within a certain amount of space with each other. Mm-hmm. Mm-hmm. Mm-hmm. It's a scroll, yeah, it's a wheel. The one I have doesn't have the four on i like around it, I don't think. Mm. Okay um we have we've about fifteen minutes left, so I'm I'm gonna continue with my pres presentation. Um I've one more slide before we close, but in that slide is when we need to make decisions about this these kinds of things, so I'll just bring that up and show you all before we move on. Um Yeah, and then like the the covers could be spongy latex wherea but the actual model could be titanium. Ah hmm hmm hmm. Okay, um components concept. Energy, chip on print. G That's th th this is the agenda they gave me. So can you just explain what that is real quick? Mm-hmm. I think it's awesome. I think it's really cool. Okay. If they're if they're really options. Okay. Um okay, then we'll move on to the case. Um oh bu I guess maybe if we decided on like a simple, a regular, or an advanced chip, maybe. It would be nice for changing the volume, but I don't know how useful it'd be for changing the channel. 'Cause you don't have control over numbers or We have five minutes left for the meeting, so. So, have a scroll for volume? F Um. I think w well I think when we go on to the une userface, we're gonna have to decide the interface we're gonna have to decide um whether we're gonna have a scroll or not. Okay, let's do case. I'm a little um I'm a little hesitant about it, because I'm worried about protecting the stuff on the inside. Um Yeah, I would be more okay with like a titanium actual thing and then maybe like a mobile p

hone kind of thing. Mm-hmm. Okay. Mm-hmm. Okay. Ge o Okay. So we uh we do want latex. Okay. Latex. Um and probably in colours, maybe fruity, vegetable colours. Fruity colours. Okay um let's go to the ufe user interface then we'll come back to the chip I suppose. Well, we don't really know what the difference is, right? Yeah. Um okay, interface, the type and the supplements. So push or scroll, right? Or both? Mm-hmm. And if we had a sc an on-screen um kind of thing that you could scroll through, like you can use your buttons to scroll through things. I think that yeah. For channel surfing I think a scroll an actual like an iPod's kind of scroll thing would be too fast, I dunno. Mm-hmm. Is that okay with you? How you feeling? Mm-hmm. It might be cool enough. Okay, so we're gonna go with um type pushbuttons, and then supplements, how are we gonna do that? Um I assume that's what else we're gonna like h ha the um the additional buttons we can use. So we're gonna have like a menu button, so that we can access on-screen things then? Okay, um so we're doing an on-screen menu that we can scroll through. Pre-set channels and then we're gonna need um numbers one through zero, right? Well, but in order to pre-set a cha oh I guess you can just hold it down when you get to one when you're scrolling through. Mm-hmm. Okay, um finishing the meeting now. Um our next meeting starts in thirty

minutes, um you each have things to do, look and feel design, user interface design, product evaluation, and you two are going to work together on a prototype using modelling clay. You'll get specific instructions from your personal coach. Um did we decide on a chip? Let's go with a simple chip? Okay. We are done. Thank you everyone. Oh I di these are already in our shared folder, so. Fourteen twenty six. Is double-curved like would be like two hands kind of thing? Okay. 'Cause I'm imagining like double-curved is like, you know, like two sides that curve and then like one curve would just be like a single vertical-ish kind of looking thing, but I've no idea. Sounds good. Thanks. Wait, but is that separate from what he was saying? Should I plug that in? Maybe it's just not Is it on? Ri What F\_ do you have to press, five? I just keep pressing lots of 'em. Well, I don't know how relevant all of this gonna be. If anything, the that they gave me. Alright. Oh yeah. Okay, so we're gonna look a little bit at trend watching. Basically, I was given um an executive summary that was a market investigation on remote controls that was recently conducted, and then also some fashion watchers in Paris and Milan commented on some things that are gonna be going on this year. So first um they had people they ranked um the important aspects of r remote controls, and right now i d they're saying that currently there's a functional look and feel preference, but that really, over the next year it it that's gonna be switching to fancy look and feel remotes, so that just goes back to the whole desire of our c Real Reaction company wanting to focus on fashion and so, even though we're stressing, when we're talking, we've all been talking about this like simplicity and easy to use idea, they're sort of wanting us to remember that the number one thing for everyone is that it's fancy look and feel. And as these are ranked, the top one is doubly important to the second one, which is doubly important to the third one, so just to take that weight into account. The second thing that was mentioned as important was the technological innovations. That would be like if we use something like the space material or the L\_C\_D\_ screen, things like that. And then ease of use was the third most important, whi so really, no matter what, we need to focus the most on fancy look and feel, according to this. I don't know how much we agree with that. And then the fashion watch talks about that this year's top trend for clothes, shoes and furniture is fruits and vegetables and tha that there's a preference f

or spongy, tight material. And so that brings us to my personal preferences. Who wants a spongy remote or one with fruit and vegetable padding. Personally, I don't really think that I want one that's gonna go out of style or go stale, excuse the pun, um in a year, so even though this is coming from us as, you know, trend watch, market research, I don't know how much of it we necessarily wanna take away. Also, considering that the d research b has been carried out by Real Reaction, I'm a little hesitant as to like, how these questions may have been worded, and if necessarily this whole fashion to technology y edas ease of use is necessarily the right ranking. Personally, like I might reverse it, but if we're working for this company then I guess no matter what, we have to stress fashion the most. But it doesn't necessarily need to be a spongy material. Yeah. I don't have a lot of notes to share if you want them, that pretty much sums it up. So yeah. Yeah, what can I possibly enlighten on? Mm-hmm. Yeah, so something, m m instead of a necess yeah, grip, I'm thinking grip more than like sinking into your hands, you know, i and I think I'm envisioning more like, you know, the material that you have when you sit on like a bicycle, so that it doesn't hurt when you're sitting down for a long time, like I'm imagining that sort of thing, I don't know what th that material's called. Oh God. What about the idea of like a round remote? Instead of like a vertical up and down one. Like in terms of holding it. Like that's a f shape of a fruit. Just to tie it in a little. Yeah. Yeah, 'cause otherwise your fingers can't move around. But I like i I love the idea of the wheel like the iPod. 'Cause th It's like five, 'cause there's one in the middle. I think why it would be good for us is 'cause like you could have the same wheel sort of effect

for like channel flipping and then the other one could be like for volume. Like just the idea of like those so few buttons for main things, but then how you could go back to the menu and like, I dunno if we would want it on the screen there or on the actual T\_V\_. I kind of am wanting to say on the T\_V\_, 'cause if you're changing the brightness, don't you wanna see it happening, kind of? And then you could still have that available. Mm-hmm. Mm-hmm. Uh-huh. If I get any more information of fruits and vegetables, I'll let you know. Well, there we go. The iPod packaging is me like was so that was like half the fun. It's like the way it all comes all cute. Lemons? Yeah, I mean, it would t totally take care of our problem of not wanting to change batteries. Costs. But over time Yeah, it's a But if you c if you could scroll through the channels, and then the volume would just be and the volume would just be like the same way, forward and backward as I'm just thinking like it would make it much like sleeker sort of looking. And otherwise, no matter how may buttons we have, we're gonna have like, you know, black with red sticking out and th no it's gonna inevitably sort of start looking like those group of sort of ugly ones that we saw stacked up. Oh could it be hard, and then something around it? I'm thinking curved of some sort. Yeah. And let's like see if we get anything else. I mean I'm not like hard-sold on the scroll wheel, it's more just to give it a different kind of look, but if it's gonna be in a latex type thing and that's gonna look cool, then that's probably gonna have a bigger impact than the scroll wheel. Like a radio type sorta situation? Wow.

---

# Meeting ID: 117

Data Source: Train

## Executive Summary

this is the beginning of the third meeting , the conceptual design meeting . Um our agenda should be um that we're opening the meeting , the minutes from the previous meeting are on the shared f drive at this point . Um and we should each have a presentation to make . Um we have certain decisions to make Um there are the decisions we have to turn to , but we'll come back to them in a minute after I take us to the minutes of the previous meeting . Um Sarah , you presented a marketing research report um which pretty much rep represented that fifteen to thirty five year olds uh it has to be hand-held , power , channel , volume , number keys , possibly a speech recognition . And then Steph did a second presentation um that those functions plus streamlining them with big user-friendly keys that were easy to use . Kate presented a working design of going after going over the basics on the whiteboard um that it should be a simple mass-produced device , because of the twelve and a half Pence cost . Um but we did talk about possibly using rechargeable batteries and having a docking place as a selling point . we agreed that the target market would be fifteen to thirty five with more money than sense , that were decision makers . Alternatively it would be a manufacturer to enclose it with the T\_V\_ , Um and that the function we agreed was volume , power , numbers , enter , channels , a way to move between channels , easy to use and hand-held . Um at that point we agreed that Sarah would look at the current cost of competition , what what do the current ones sell for . Um and Steph was gonna look at ec ergonomics . Kate was gonna look at cost and feasibility of the various possibilities that we discussed . first thing I want to address is um one of the points that Florence brought up , which was uh current cost of the competition devices , and and they're uh twenty to sixty Euros , depending on uh branding . But I think that with the current um price that we're searching for , we're well within , even on the lower end , of the uh of the market . I investigated the remote control market in greater detail , What's hot , fruit and veg . Spongy . And this is all over the catwalks , Paris , Milan , and I'm talking about clothing , furniture , shoes . This is really interesting change from past years , because it is much more organic , And I think if we're to refashion our view of what we want in a remote control , we should perhaps think about incorporating technologically interesting fabrics and some of the bold colours into a simple handset . on um what again are the most important priorities in uh decision making about uh purchasing . Functional is out . Fancy . And f the fancy , and that's exactly the term , I'm I'm thinking polished , elegant , you know , kind of innovative , but a cut above . This is twice as important as the next finding , which is

technologically innovative . This is interesting , 'cause I think in the last meeting we were talking about technology as being so important , but maybe what's innovative is having it simple with um with uh technologically superior fabrics or uh , you know , designed in interesting substances . Ease of use . Again , pretty low , I mean it's the top three , but each of the uh fancy and technologically innovative are far more important . I think we should cloak the streamlined remote control device in a series of fruit fruit themed sleeves . It sounds like the the uh covers that they use for the remote , you know , your t your cell phone . I was thinking though that instead of having something uh like patterned , you know , so , you know , something similar to a summer dress . you know , it would have like fruit and veg , is that we actually make these spongy . initially I thought we could start with kind of um fruit that would suit kind of uh a long uh hand-held , so banana , pineapple and pear . They could be interchangeable , they're spongy , So what we're talking about is changing . this concept . Everyone has a T\_V\_ remote , but the person who is really perhaps active in personalising , I'm thinking the teenager , the someone fifteen to thirty five would go out and get this additional thing the same way as you mentioned that people would get the cell phone covers . So I really open this up to uh any other feedback . This spongy fruit and veg . I I think we're gonna have some trouble when we get down to the component design on this . And as for as for um well budgeting as well , if we're gonna have lots of different interchangeable components . we can make these things out of wood , titanium , plastic or rubber . I suppose rubber is the closest to spongy , I was thinking titanium myself . I have been influenced by pictures of iPods , I think many of us would associate those with fancy . it would be uh a a very simple product that would have a spongy sleeve that would be interchangeable . So Perhaps perhaps that desi that particular suggestion needs to go back to management W w would it be helpful if um I described the components a bit , I think possibly it might be more useful if Kate went next . I was really thinking a lot about the I\_ uh the iMac kind of gel gem tone . you're gonna be a little disappointed with some of the things I have to tell you , I've been looking at the the basics of how these devices actually have to work in order to operate , and I've had some discussions with the ma manufacturing division , who have told me what's actually available , you know , what the current state of the art in components is , and some of the exciting new things they've got , this is the innards of a remote control um . and that's the the back of the interface . And this is a push-button one , so you see these little little buttons here , they're little rubber rubber buttons that go through onto the the board at the back and they push these buttons here . that's the basic construction that we've got to got to accommodate . We got to have something that pushes the little buttons that um talk to the chip that encodes the message that sends the the message to the receiver . So first of all um I wanna talk about what possibilities we've got for the energy source . Um we can have your bog standard double double A\_ batteries in a replaceable um little compartment . We can have a hand a wind-up , yeah , but i it maybe is doesn't quite go with the um the fruit and veg . Um one that one that I think is quite interesting is the kinetic energy source , where um you you actually get the energy by moving the device , Or we we had talked about solar power , but I thing that we agreed that that's not so good in the dark . I'm afraid this is the options we've got on on the case . It can be made of plastic , rubber , wood o if you like , or titanium . Um and the nearest we've got to st to spongy there I guess is rubber , and basically it can have a flat surface , a curved surface or a double curved surface , but I think if we wanna use standard components , we're gonna have difficulty with anything much beyond that . push button , that's that's the one

we're all familiar with . what does the interface look like ? Um we can have scroll buttons and the the scroll button can incorporate a push , so you can have it like on a mouse where you can use it to go up and down , change volume or channel or something like that and push to select something . Um you can have multiple scroll buttons , And we can also incorporate an L\_C\_D\_ display in the remote , but this will increase the cost . Um the electronics that actually makes the device work , we've basically got three , simple , regular , advanced , If we want the nice cheap one , the simple , then we can only have push buttons . Um pay a little bit more for a regular chip and you can have scroll buttons . And the manufacturing division tell me that they have recently developed um sample sensor sample speaker devices . I don't know what that is , but I think they think it's quite important I I think we've got two options . We can either go for a really cheap model , keep all of the costs down , Or we can have something that looks a bit nicer , I think it , um won't necessarily I uh look like a pineapple , Um but it could have an L\_C\_D\_ screen and it could have multiple scroll buttons , Um do you have any idea if if this could if the fancy model could be done in twelve Euros fifty ? and it could have the the company's new development of the um sample sensor and speaker . I'm afraid I don't have that information available . Um manufacturing didn't actually give attach any prices to any of this , I'm afraid . so what I had been thinking was something chunky and yellow and plastic with black buttons with a logo on it . I I don't know how important that is to keep it exactly the colours of the Real Reaction company . That's before I heard about all this hot tips about the future , fruit-wise . We we could we could do um a double curved rubber one , which would allow um say a banana , but um unfortunately I see from my notes that if we do that , we have to have a push button as the interface , I don't actually have a huge amount of different information then what Kate says , just that my method was to look at the , well , my my inspirations , which was a big collection of lots of different models of remote controls and other things that use a similar sort of thing , including M\_P\_ three players , uh like you know , hi-fi remotes , not just television and these things . Uh having a think about the feature of ea the features of each ones , Uh I've been especially interested in the iPod style scroll wheel , um what functions we actually need , It has uh scroll wheels without without a display , but it had a similar thing to this thing on the right . So I was thinking that uh um a really simple a really simple interface with just a couple of scroll things on it um and then instead of a display the display could appear on the television screen . and it comes up with what's showing on that channel at the moment , you can scroll along and you can see what's on the other channels while you're watching the same channel on the screen . Uh but I'm also equally taken with this chunky plastic kiddie remote , um which is really nice and fun and good to hold and nice , big , easy buttons to press , but still quite simple and quite cost effective . what seems kind of ideal for me would be to just have a fairly simple , uh not fancy but not totally minimalist , I mean just pretty simple plastic , probably , I was thinking , yellow and black , just because that's the company's colours , with very very few buttons , but that would correspond to a screen that would appear on the television screen , like , you know , just small along the bottom Yeah , I'd I'd certainly support that idea . And uh and I definitely support uh the use of plastic and or rubber . I mean titanium would be great , but I think it might be a bit too expensive and too kinda spacey . we can't for example have a double curved case in titanium unfortunately . But as for actually arranging them let me go back to the to the picture of the kiddie one . And I quite like it , 'cause it's just smooth and hand-held and it's got these easily reachable buttons so something a bit like that with buttons arranged in a kind of circle . Up , down , left , right . Do

you want scroll buttons in that as well ? I I was thinking not actually scroll , like a like mouse scroll , like this s style thing where you c have up , down , left and right . And enter in the middle , and when when you click on each one , it you can go into a new menu for that . It seems that that uh you guys are quite keen on the plastic , Uh just something else I need to bring to your attention Um we need to come up with some specifics of the components , um the materials , things like making the decision on the energy um and the case and the interface type things . If we're k trying to keep it colourful and slightly organic , then I think titanium's too futuristic . Whereas a plastic's so cheap and easy and mouldable and everything else . And the the having the the the screen on the television screen I think is a good idea , I think I think that's a g nice clean design , But they all have this this feature of this uh It's not quite a scroll wheel , but it's a kind of selection in this circle , But we can implement it with simple push buttons , either a channel up and down , volume up and down , next appearing programmes up and down , uh and then also when you get into the different menus on the screen , it's got your things like settings and contrast up and down . So all you really need is these four buttons with the enter in the middle . Do you think we could put it in a in a fruit colour ? And have it abstract . we could call like a fruit name , Mm . We we could actually do it in rubber instead of plastic if you'd rather if you feel if you like the spongy I'm thinking maybe we need to be a little bit more abstract if the design constraints are so This is actually the volume up and down , but they both say V\_ on them , so uh we do need to avoid little ambiguities like these . But we wouldn't have a specific volume up and down . If we're having the scroll wheel , then it's gonna double up as all the other up and down functions . They want us to decide what form of energy are we going to use , which the choices that we've discussed were pretty much battery , kinetic or solar . You were saying that the kinetic would be useful , um as opposed to a battery that you have to either put it in a recharger or um keep replacing the batteries . Um or solar that you'd have difficulty with it if it's a dark day , that it'll die on you , and no way to do it . unfortunately I don't have costing information . I i in terms of workability , I I think the the two front-runners are the standard battery or the kinetic , What's the uh feelings of the group on the kinetic ? I've used kinetic in terms of watches you don't even notice um that it's there . I've never come across it before , but it sounds fantastic . it would make the whole thing a lot lighter , more convenient . a good selling point . So the consensus seems to be use the kinetic if it's at all possible . But it does depend how much I mean how much it costs and how much more development and research it needs . Mm . Um the next thing that they wanted us to do was look at chip on print as a decision . Um chip on print is just a manufacturing technique um and I would certainly recommend it , I think , Um what about the case ? I think they're talking there about do we want wood , plastic , titanium or rubber , Do you not think it might need like a kind of a hard plastic inner shell with the actual delicate workings inside , and then a kind of spongy Yeah , s thick spongy cover , and I think we've discussed not having titanium . Um we've sort of eliminated wood . We said plastic or rubber . I'd I'd need to talk to manufacturing again about whether that's actually possible , but I agree , it's uh sounds like a nice idea if it is . Um the next part they want is the user interface concept . Then I'll just say I support either from a marketing point of view I support either decision that the designers make on that . like four buttons , up , down , left and right with enter in the middle , that will correspond to a menu on the screen . I'd like push buttons with but the next meeting starts in thirty minutes . Um this is gonna sound weird , And they actually want a look and feel design , user interface design , Marketing they want product evaluation . Um the look

and feel design is for Kate , uh Steph gets the user interface design , Um the two of you get to play with a Pla modelling clay um to do a prototype . you get product evaluation . Uh and everybody gets individual instructions in the usual way . And that's the end of this meeting .

## Complete Meeting Transcript

I respond to either. No worries. Okay, first thing I want to address is um one of the points that Florence brought up, which was uh current cost of the competition devices, similar to the ones that Stephanie uh showed us and and they're uh twenty to sixty Euros, depending on uh branding. Some of them that have a higher brand recognition are on the more expensive end. But I think that with the current um price that we're searching for, we're well within, even on the lower end, of the uh of the market. But I'm going to move on to more interesting um more vibrant things. So, I investigated the remote control market in greater detail, and my uh the theme of what I was to work on was uh trend watch. And I know that you all are a distance from cutting edge marketing research, so you know, I'm just gonna try to cloak it in really professional terms here. What's hot, fruit and veg. Spongy. And this is all over the catwalks, Paris, Milan, and I'm talking about clothing, furniture, shoes. This is really interesting change from past years, because it is much more organic, um some would say approachable. And I think if we're to refashion our view of what we want in a remote control, we should perhaps think about incorporating technologically interesting fabrics and some of the bold colours into a simple handset. So. I also did a little research on um what again are the most important priorities in uh decision making about uh purchasing. Fancy. Functional is out. And f the fancy, and that's exactly the term, I'm I'm thinking polished, elegant, you know, kind of innovative, but a cut above. This is twice as important as the next finding, which is technologically innovative. This is interesting, 'cause I think in the last meeting we were talking about technology as being so important, but maybe what's innovative is having it simple with um with uh technologically superior fabrics or uh, you know, designed in interesting substances. Ease of use. Again, pretty low, I mean it's the top three, but each of the uh fancy and technologically innovative are far more important. So I think we should cloak the streamlined remote control device in a series of fruit fruit themed sleeves. Y yeah, you know Exactly. Exactly. I was thinking though that instead of having something uh like patterned, you know, so, you know, something similar to a summer dress. you know, it would have like fruit and veg, is that we actually make these spongy. They could be ini initially I thought we could start with kind of um fruit that would suit kind of uh a long uh hand-held, so banana, pineapple and pear. Um it could actually the sleeve could take up a lot of the development and the remote control, we'd just need to get reductionist on it. They could be interchangeable, they're spongy, that goes back to ergonomic, and the youngsters love 'em, fun for the whole family, everyone can have their own. So what we're talking about is changing. this concept. Everyone has a T\_V\_ remote, but then we add in the fact that they could each have their own individual fruit. That's what's hot on the catwalks. So, this is my This is what I'm thinking. Y yeah, but I think I think what this would allow is perhaps a person in the family who had the most opinion about it we all need a remote, but the person who is really perhaps active in personalising, I'm thinking the teenager, the someone fifteen to thirty five would go out and get this additional thing the same way as you mentioned that people would get the cell phone covers. Yeah. W and plus I think Uh yeah. Yeah. Yeah. So this is an idea and I I you know, this is exactly what the research has uh has shown. So I really open this up to

uh any other feedback. This spongy fruit and veg. Thanks. Alright. I I just have my ear to the market, guys. Is spongiest, yeah. That would add Mm-hmm. They are and they they would fulfil the uh first um priority, which is fancy. I think many of us would associate those with fancy. Something else we could do i

s uh call it something that's fruit and veg oriented. We could call it uh The name. Well it would be uh a a very simple product that would have a spongy sleeve that would be interchangeable. So That, you know, that might be And then we could keep it titanium. Yeah. Or s or smelly. Scratchy Uh well I was really thinking a lot about the I\_ uh the iMac kind of gel gem tone. It's hot on the streets, guys. Mm. Hmm. Hmm. Hmm. Mm. That sounds good. Any idea you you mentioned that there would be a cost difference. Um do you have any idea if if this could if the fancy model could be done in twelve Euros fifty? Hmm. Because, you know what, I'm being quite serious when I say that that um the things I mentioned are hot. But I think the important thing might be to choose one. You know, if if what you're telling me is is um some of these things aren't just f aren't feasible, maybe we could something about naming, we could call it, you know, Blackberry. That's uh Alright, well let's see then. Yeah. Yeah. But yeah, I'm trying to streamline mine a little bit. Yeah. Hmm. Yeah. Mm. Thank you, Kate. Mm. Oh I think um Florence resolved it by F\_ eight again. Maybe. Mm. Hmm. It's a duplication. Mm-hmm. Mm-hmm. To uh m make it. Oh nice. Um Hmm. Mm. Wow. Do you think with um It seems that that uh you guys are quite keen on the plastic, perhaps the something reminiscent of the child's remote. Do you think we could put it in a in a fruit colour? And have it abstract. You know, we could call like a fruit name, but it would be a little more abstract. Mm-hmm. I'm just just throwing out ideas. Yeah. I'm thinking maybe we need to be a little bit more abstract if the design constraints are so Mm-hmm. Mm-hmm. Nice. Good point. I've used kinetic in terms of watches and it's very very uh handy, you don't even notice um that it's there. It's Mm-hmm. It could tie in with the fanciful design as uh, you know, throw the banana, you know, just gotta keep it moving. Be Yeah. Yeah. Mm-hmm. But I could market that as a um as a a I was thinking actually a a cost saver down the road, in terms of battery, you know. Mm-hmm. You know, kind of the That's exactly what I was thinking. I'm sold. Mm. Kind of like an internal egg. Yeah. And with sports on television. You know. I su Then I'll just say I support either from a marketing point of view I support either decision that the designers make on that. No we can't, actually. That's why I was looking over your shoulder Mm. Sounds good. That's really all I got, guys. Just just carry on. Mm-hmm. Mm-hmm. Sorry. I'm glad to see the marketing budget is being so well spent on. I think that's a good idea. Don't you? Yeah, I I think we're gonna have some trouble when we get down to the component design on this. Spongy is gonna be difficult, I'm afraid. Yeah, I mean basically we can make these things out of wood, titanium, plastic or rubber. I suppose rubber is the closest to spongy, yeah. I was thinking titanium myself. Yeah. W w would it be helpful if um I described the components a bit, because I think it would give you um maybe bring this discussion back to Earth of what we can actually physically do. Right, well I I I think some of this um you're gonna be a little disappointed with some of the things I have to tell you, but I'm afraid this is the real world. So um I've been looking at the the basics of how these devices actually have to work in order to operate, and I've had some discussions with the ma manufacturing division, who have told me what's actually available, you know, what the current state of the art in components is, and some of the exciting new things they've got, but I'm not sure that it's quite what you want um. Now this isn't a very good overhead, but this is just to show you, this is the innards of a remote control um. I really need a pen or something but uh does my mouse work? No. Um oh yeah, can you see my little mouse pointer? Right. This is this is the a a a remote that's been opened up and that's the the

back of the interface. And this is a push-button one, so you see these little little buttons here, they're little rubber rubber buttons that go through onto the the board at the back and they push these buttons here. Um and we that's the basic construction that we've got to got to accommodate. We got to have something that pushes the little buttons that um talk to the chip that encodes the message that sends the the message to the receiver. So um I wan I wanna go through not not just addressing the um uh the the points that you made, Sarah, but um doing my presentation in the order I wrote it. So first of all um I wanna talk about what possibilities we've got for the energy source. Um we can have your bog standard double double A\_ batteries in a replaceable um little compartment. We can have a hand sorry a wind-up, yeah, which I think is quite an interesting concept for a sorry for a remote control, but i it maybe is doesn't quite go with the um the fruit and veg. Um one that one that I think is quite interesting is the kinetic energy source, where um you you actually get the energy by moving the device, which is quite a ni a nice and neat one. You have to it means that if it's sitting there for a long time it probably won't work, but you have to sort of throw it between your hands every now and then, it'll work. Or we we had talked about solar power, but I thing that we agreed that that's not so good in the dark. Now I'm afraid this is the options we've got on on the case. It can be made of plastic, rubber, wood o if you like, or titanium. Um and the nearest we've got to st to spongy there I guess is rubber, but um I'm gonna come back to the advantages of titanium, and basically it can have a flat surface, a curved surface or a double curved surface, but I think if we wanna use standard components, we're gonna have difficulty with anything much beyond that. Okay, what does the interface look like? Um well push button, that's that's the one we're all familiar with. Um we can have scroll buttons and the the scroll button can incorporate a push, so you can have it like on a mouse where you can use it to go up and down, change volume or channel or something like that and push to select something. Um you can have multiple scroll buttons, um this is maybe getting a little bit complicated, but um it's it the technology is there. And we can also incorporate an L\_C\_D\_ display in the remote, but this will increase the cost. Um the electronics that actually makes the device work, we've basically got three, simple, regular, advanced, and the price goes up as we choose each of this. If we want the nice cheap one, the simple, then we can only have push buttons. All the other fancy interface designs go out the window, I'm afraid. Um pay a little bit more for a regular chip and you can have scroll buttons. If you want the advanced chip it obviously costs more, but it that's what you need if you want the L\_C\_D\_ display. And the manufacturing devision tell me that they have recently developed um sample sensor sample speaker devices. Now I don't know what that is, but I think they think it's quite important and we might want to incorporate it somewhere. Um ou our real expertise is in push buttons, I have to say, but maybe you think that's old technology. And well I I think we've got two options. We can either go for a really cheap model, keep all of the costs down, um which means a flat plastic case with an ordinary battery and simple push buttons. Or we can have something that looks a bit nicer, I think it, um won't necessarily I uh look like a pineapple, but um that may or may not be a good thing. Sorry. Um but it could have an L\_C\_D\_ screen and it could have multiple scroll buttons, and it could have the the company's new development of the um sample sensor and speaker. So, thank you. Yeah, I'm afraid I don't have that information available. Um manufacturing didn't actually give attach any prices to any of this, I'm afraid. Yeah mm-hmm. Bana

na? We we could we could do um a double curved rubber one, which would allow um say a banana, but um unfortunately I see from my notes that if we do that, we have to have a push button as the interface, we can't do anything fancier. Yep. I If you do F\_ uh F\_N\_ F\_ eight again, it's it'll I think it yeah, you you will do an Hmm. Hmm. Yeah. Yeah, I'd I'd certainly support that idea. It's difficult to make fancy

shapes in it as well, we can't for example have a double curved case in titanium unfortunately. And the the having the the the screen on the television screen I think is a good idea, 'cause um otherwise we're we're putting up the price not only for putting building the L\_C\_D\_ in, but for the electronics as well. There is that. Do you want scroll buttons in that as well? Mm-hmm. Right. Yeah. I think I think that's a g nice clean design, it's playing to our strengths which are in push button technology. Yeah. But we can implement it with simple push buttons, which is much cheaper. In fact Oh that's really nice. Hmm. Mm. We we could actually do it in rubber instead of plastic if you'd rather if you feel if you like the spongy Hmm. Yeah. Yeah. Yeah. Mm. Oh unfortunately I don't have costing information. I i in terms of workability, I I think the the two front-runners are the standard battery or the kinetic, but I'm sorry I don't figures on the difference in cost. And and how much you do have to keep it moving, 'cause I'm conscious that watching T\_V\_ can be quite a sed sedentary activity. Yeah. True, yeah, m more more environmentally friendly. Oh right, okay, I'd that that's something I maybe should have covered. Um chip on print is just a manufacturing technique um and I would certainly recommend it, I think, because I'm not sure I have an alternative. I i it's just the way that the the the uh th the way it's ac it's actually built and you you print onto the circuit board like you might print onto paper. Well if if Sarah's keen on a spongy feel, the the rubber that we're talking about is the same as you have in those little stress balls, so it's yeah. Yeah. I'd I'd need to talk to manufacturing again about whether that's actually possible, but I agree, it's uh sounds like a nice idea if it is. I should I should r Which I think technically is just push button and uh I'd certainly support that that that brings the cost down quite a lot and it's something that we're an ex the company's an expert on. You know, I think the the company's s next project should to design a better overhead device that switches immediately. Yeah. Yes. Yep. Yeah, Right. Yes. So when your dad's sitting there, overriding your decision, going no we're gonna watch this, you can bring out your own remote and be like zap, no we're gonna watch this. Yep. And as for as for um well budgeting as well, if we're gonna have lots of different interchangeable components. Is this to the market? I was thinking titanium, I was thinking it's just I have been influenced by pictures of iPods, and they're also minimalist and shiny. Yeah, but it's kind of pointless, isn't it? Yeah. Let's delegate. Yeah, maybe. Or I think possibly it might be more useful if Kate went next. Um You can even have them in different flavours as well. So that if you just wanna sit there and chew on the remote, it could be like pear flavour, yeah. Scratch and sniff. A wind-up. Bear bear in mind it has to be the colours and styles of the company, so what I had been thinking was something chunky and yellow and plastic with black buttons with a logo on it. But um I I don't know how important that is to keep it exactly the colours of the Real Reaction company. It's just what I'd understood we'd be doing. That's before I heard about all this hot tips about the future, fruit-wise. Shall we wait 'til I've 'til I've showed you what well, my extensive presentation on what sort of interfaces are available. You did seem to include just in more detail what I've got though. So so mine's a bit pointless. Right.

F\_N\_ and F\_ eight, did you say? I don't have it on mine though. Should I do it again? Right then. I don't actually have a huge amount of different information then what Kate says, just that my method was to look at the, well, my my inspirations, which was a big collection of lots of different models of remote controls and other things that use a similar sort of thing, including M\_P\_ three players, uh like you know, hi-fi remotes, not just television and these things. Uh having a think about the feature of ea the features of each ones, um what functions we actually need, and then how to group and arrange these on the actual the actual plastic or rubber hand-held piece. Uh I've been especially interested in the iPod style scroll wheel, which Well, I couldn't find a the picture of the iPod w only linked to a web browser, so I couldn't copy and paste it, but it had a similar thing to this thing on the right. It has uh scroll wheels

without without a display, but they they scroll like a computer mouse. So I was thinking that uh um a really simple a really simple interface with just a couple of scroll things on it um and then instead of a display the display could appear on the television screen. Like I guess an existing Sky or cable one does. Like, you know, you press enter and it comes up with what's showing on that channel at the moment, and you can do you can scroll along and it'll show you what's on in the next half hour, and you scroll up and you can see what's on the other channels while you're watching the same channel on the screen. Uh but I'm also equally taken with this chunky plastic kiddie remote, um which is really nice and fun and good to hold and nice, big, easy buttons to press, but still quite simple and quite cost effective. So what seems kind of ideal for me would be to just have a fairly simple, uh not fancy but not totally minimalist, I mean just pretty simple plastic, probably, I was thinking, yellow and black, just because that's the company's colours, with very very few buttons, but that would correspond to a screen that would appear on the television screen, like, you know, just small along the bottom instead of instead of having the iPod style display screen on the actual remotes, which is far too expensive. And when you've got a screen sitting there in front of you, you might as well have it appearing uh on the screen in front of you, it doesn't obscure much of the actual picture you're watching. And so on that you can, just much in the same way as an existing Sky remote, scroll along, scroll up and down. And uh and I definitely support uh the use of plastic and or rubber. I mean titanium would be great, but I think it might be a bit too expensive and too kinda spacey. If we're k trying to keep it colourful and slightly organic, then I think titanium's too futuristic. Yeah. Whereas a plastic's so cheap and easy and mouldable and everything else. Uh then And it's a little bit pointless as well I think. Like when when when you've got when you've got the screen there, it doesn't have to be anything fancy, just a little menu showing yeah, a menu, you go into one menu and then it can have your different options, whether you wanna change the settings or the you know, your information about programme that's on at the moment. I don't think that's to taxing to uh s engineer. Um. But as for actually arranging them let me go back to the to the picture of the kiddie one. And I quite like it, 'cause it's just smooth and hand-held and it's got these easily reachable buttons that quite nicely uh spaced out, so something a bit like that with buttons arranged in a kind of circle. Up, down, left, right. I I was thinking not actually scroll, like a like mouse scroll, but you know, a I can't quite d uh describe it. you see on the one on the right, down at the bottom, is the mouse. Yeah, see where the mouse is, like this s style thing where you c have up, down, left and right. And enter in the middle, so you pick your menu an

d then your different options and when when you click on each one, it you can go into a new menu for that. I'm getting a bit uh specific here. Really we'd have to use something to show you, but If I don't think I can get it up on the screen. Ah here we go. Right. Well, the iPod spinning wheel is uh really complicated. It does scroll, but it is hugely complicated. What else have we got? Them, they're terrible. But they all have this this feature of this uh It's not quite a scroll wheel, but it's a kind of selection in this circle, which I think is a really good idea. Yeah, like up, down, left and right. Which is good. And then and then Yeah, so I mean either a channel up and down, volume up and down, next appearing programmes up and down, uh and then also when you get into the different menus on the screen, it's got your things like settings and contrast up and down. So all you really need is these four buttons with the enter in the middle. And that's it. Look at look at this one. Almost impossible to misplace or I or lose. Might take up your whole living room. Possibly. Yeah. That also is possible. Just Uh just something else I need to bring to your attention is have you have you seen these on a remote? This is actually the volume up and down, but they both say V\_ on them, which, when you first look at it, you expect that to be the down, because it looks like a downward pointing arrow, but it's actually the V\_ to indicate that it's

the volume, so uh we do need to avoid little ambiguities like these. But we wouldn't have a specific volume up and down. If we're having the scroll wheel, then it's gonna double up as all the other up and down functions. But then, that's complicated. It sounds great. I've never come across it before, but it sounds fantastic. Sounds like it could be a really good economical it would make the whole thing a lot lighter, more convenient. Yeah. 'Cause it's really a quite attractive thought, isn't it? It's like yeah, a good selling point. But it does depend how much I mean how much it costs and how much more development and research it needs. Do your exercises while you're watching the T\_V\_. Yeah, that's what I was thinking as well. Do you not think it might need like a kind of a hard plastic inner shell with the actual delicate workings inside, and then a kind of spongy Yeah, a thick spongy cover, so it feels like the whole thing's spongy, but actually you're not damaging anything by squeezing it. Because I mean you could just get carried away with the with the tact Yeah. Well you do get a bit carried away with things that are tactile, you just wanna stroke them and squeeze them, and Just copy the one on the left. No um a scroll Well, like four buttons, up, down, left and right with enter in the middle, that will correspond to a menu on the screen. Yeah, I'd like push buttons with So push buttons No, it's still it's still plugged in on mine actually. Now it's gone again. Oh yes. Great. I don't think so. Play-Doh. Hi Kate. Okay, carry on. Alright um this is the beginning of the third meeting, the conceptual design meeting. Um our agenda should be um that we're opening the meeting, I have the minutes from the previous meeting are on the shared f drive at this point. Um and we should each have a presentation to make. Um we have certain decisions to make and we have forty minutes total. It's twenty five after two at the moment, so forty minutes is five after three, um which I'll be keeping an eye on the clock for us. Okay. Um there are the decisions we have to turn to, but we'll come back to them in a minute after I take us to the minutes of the previous meeting. Right um as we remember, I opened the meeting, the four of us were present, the meeting the first meeting's minutes were reviewed and approved. Um Sarah, you presented a marketing research report um which pretty much represented that fifteen to thirty five year olds uh it has to be hand-held, power, channel, volume, number keys, possibly a speed

ch recognition. And then Steph did a second presentation um that those functions plus streamlining them with big user-friendly keys that were easy to use. I think all of us agreed with those things. Kate presented a working design of going after going over the basics on the whiteboard um that it should be a simple mass-produced device, because of the twelve and a half Pence cost. Um but we did talk about possibly using rechargeable batteries and having a docking place as a selling point. Um and the new requirements that it for be for T\_V\_ only um and that it include the logo slogan and colour of the uh corporate design be included. Um the corporate image. So we agreed that the target market would be fifteen to thirty five with more money than sense, that were decision makers. Alternatively it would be a manufacturer to enclose it with the T\_V\_, but it still should meet those parameters. Um and that the function we agreed was volume, power, numbers, enter, channels, a way to move between channels, easy to use and hand-held. Um at that point we agreed that Sarah would look at the current cost of competition, what what do the current ones sell for. Um and Steph was gonna look at ergonomics. Kate was gonna look at cost and feasibility of the various possibilities that we discussed. And I was to type up these minutes and work on the final report. Is this a fair presentation of what our last meeting was? Okay. Right. So we're ready to close that and go back to our That one. Right. We're up to the point of the Go back. Um the three presentations. So we're going to pull the plug on me and turn to Sarah. Is that okay? Is that alright with everybody else? Especially since Kate asked to be last. Sarah, I'm sorry if I misspelled your name, I didn't know whether it was S\_A\_R\_A\_ or S\_A\_R\_H\_. You respond to whatever you get, huh? Okay. Um, did you do your Hit Ah, there it is. Ta-da. Mm 'kay. 'Kay. Mm. It

sounds like the the uh covers that they use for the remote, you know, your t your cell phone. Mm. Hmm. Uh-huh mm. In most families, don't isn't the remote is a remote. Mm. Mm. Well actually some households do have three and four T\_V\_s and they would have a remote for each one, so. Hmm. Hmm. Are we talking about the device itself or the c or a cover for the device that would be an interchangeable cov cover as a separate product? Perhaps perhaps that desi that particular suggestion needs to go back to management and perhaps go to another group to actually design as a separate product. Wo would that be agreeable? Do you wanna be next or you want Kate to go next? Okay, we'll move the Mm. Mm. Alright. Remember, we only have forty minutes Hmm. Mm. Hmm. Thank you, Kate. Yes. There we go. Do it again. Keep doing it until you get it in both you get it there, you get it yours without that one, and then you get it with both. Yeah. This time it should come up both. Okay. Mm-hmm. Mm. Hmm. Mm. Huh. It's a selection wheel. Okay. Okay. Or call it a or call it a banana and have it in yellow. Okay. Mm-hmm. Mm-hmm. Hmm. Hmm. Mm 'kay. I wanna thank you all for all your presentations. We have about ten minutes left, in which time we have to make some decisions on the remote control concepts. Um and I think you all have been self-stimulating of working together. Um we need to come up with some specifics of the components, um the materials, things like making the decision on the energy um and the case and the interface type things. So let's Mm. Right. They want us to decide what form of energy are we going to use, which the choices that we've discussed were pretty much battery, kinetic or solar. Um this is where Kate's expertise comes in, and our decision making will be a little bit guided by Kate at this point. The You were saying that the kinetic would be useful, that is you just have to move it some and you'd be able to use it um as opposed to a battery that you have to either put it in a recharger or um keep replacing the batteries. Um or solar that yo

u'd have difficulty with it if it's a dark day, that it'll die on you, and no way to do it. That's the day you wanna use the T\_V\_. Um so what's our pleasure here, what would be the cost consequences of each of the three? Okay. Mm 'kay. What's the uh feelings of the group on the kinetic? Hmm. Hmm. So the consensus seems to be use the kinetic if it's at all possible. It costs. Mm. Mm. Mm. Hmm. Yeah. Thanks for the reminder for five minutes to finish, thanks. Um the next thing that they wanted us to do was look at chip on print as a decision. Oh. Okay. What about the ca yeah. Oh, the way we uh-huh. Oh, okay. Um what about the case? I think they're talking there about do we want wood, plastic, titanium or rubber, and I think we've discussed not having titanium. One, it's too expensive, um and second, it won't do this double um curves. Um we've sort of eliminated wood. We said plastic or rubber. What's the pleasure? What about you? Cover. Uh-huh. Plastic inside. Hmm. Okay. Um the next part they want is the user interface concept. I'm sorry to push you, but we only have a couple minutes to finish with. Okay, and it says interface. What type and what supplements? Okay, um that's that. Um this is gonna sound weird, but the next meeting starts in thirty minutes. Whew. And they actually want a look and feel design, user interface design, you can look and see this as well as I can. Marketing they want product evaluation. Oh. Oh my, I'm sorry. Oh, okay. Sorry about that. missed that one. This ought to be fun trying to get this thing to work. Ah, ta-da. Ah. Yes, because I can't even see mine. Next meeting starts in thirty minutes, these are the individual actions. Yeah, right. Um the look and feel design is for Kate, uh Steph gets the user interface design, you get product evaluation. Um the two of you get to play with a Pla modelling clay um to do a prototype. Uh and everybody gets individual instructions in the usual way. Anything else we need to do? Go to it. And that's the end of this meeting. That's for her benefit.

# Meeting ID: 2

Data Source: Train

## Executive Summary

well w what I didn't actually realise it was that the uh this is for a specific television . So the all in one idea goes out the window . now , it was function F\_ eight . f oh sorry F\_ eight . and if you just click that it'll go ahead , one at a time . Uh , yes , I have to look at the uh market potential for this product , Uh then uh the methodology I adopted to find out all this was market survey . Seventy five percent of users they do find it that the remote controls available in the market are ugly . uh we have to take care of this fact also like our design , uh should be appropriate , should be good looking for the consumers . Uh and even uh the good thing about this is that eighty percent of users they are willing to pay high uh pay more for this uh good looking remote controls also . but rather than those having more functions in the remote controls we should emphasise what actually consumer want , what they operate , rather than making it too complicated . Because mostly it has been found that fifty percent of the users they use only ten percent of the buttons , Oh you wanna go back ? Just escape . If we look at the costs whether the consumers they are willing to uh pay more for speech recognition in a remote control or not , we can find that they up to a thirty five years age group we have a very good disliking for this uh this uh point , like for speech recognition in a remote control . because it will definitely enhance our sales in this ag in this particular age group from uh fifteen to thirty five , They find that thirt uh thirty five percent uh thirty four percent of the consumers they find too difficult to operate a remote control . Yeah . No signal . Computer adjusting , yeah . Um , F\_ five and escape'll bring it back and just uh the left button for advancing . uh I'm concerned with um w what effect the apparatus should have on the user I want to point out that our motto , put the fashion in electronics , the basic that was the basic function to send messages to the television set . but I've got some pictures here of some leading ones . These are two leading um remote controls at the moment . I mean this one's got loads of buttons , Um , personally I prefer this one just because it's looks easier use , it's a bit more sleek with more of this silver stuff , Um , well I think we need to I I think the ergonomics is quite um important , um And um I thought not too edgy and like a box , so I think what we can miss out on the buttons we can make up for in design and and how nice it looks . was maybe a bit of a gimmick to set us apart from other people , like glow-in-the-dark Easy finder with the a whistle function or something , or rechargeable station because it's a pain when you run out of batteries . and uh I was just curious to know , have we done any research into how many people can whistle ? is that a function we want in the remote ? you

could have the basically um instead of a whistle if it's got the voice recognition you could have it just , you know , where are you ? . Um a much easier thing is just any loud noise like clapping um , shouting , you know , uh and then , what would the response be ? It beeps back at you or something ? Oh you need to twiddle the thingamibobsy thing . So I plug it in , press F\_ five ? and I jotted down some notes as to what are the b needs and uh what kind of novel features we can add to differentiate our product from the others . And uh a novel feature which uh we just brought up was this this automatic speech recognition feature or noise detection feature for when you lose the remote , there could be a little microphone on it , and any noise over a certain threshold um it'll pick up as a a distress signal um from you and it'll beep back and say you know oh here I am or something of this sort . But sure surely that would have to be um sort of specific rather than above a threshold 'cause if you had a loud movie on you're likely to get it beeping back at you . and then as for the user interface it should be trendy , right , so more low tech and not too many buttons . So I think I missed the budget thing , it was fifty million Euros ? so we're making that at twelve and a half Euros a time . Well I guess more realistically then , we need a product that's got some kinda nifty outer casing , An energy source which'd probably just be uh your regular batteries cheap plastic uh , you know , Would it be possible to have the rechargeable idea ? Yeah , yeah , we could do that too . Or a little base station or something , . uh the canonical user interface for these would be just a bunch of buttons , but since we're a cutting edge company , we uh of course will have alternatives like uh speech recognition , whistling recognition and rocket power Um and lastly the transmission interface is uh , just some engineering thing you don't have to worry about . Um so here's you know , a great schematic that my uh apprentice designer gave me . uh personal preferences , I think uh programmable options which um just require a small amount of memory , just um so the user can put in their favourite channels and maybe their preferred volume settings so that when they turn it on it's not blasting . And the uh , the bells and whistles that we mentioned you know , they take more budgeting , um more technical uh expenditure of effort and it's also much more likely to not work if if we add these bells and whistles . Right , also so um a notice I got not very long before the meeting , We had that um to dis-include teletext um because it's become outdated , and everybody uses the internet anyway . Um it's only for the television , and um instead of colours and sorta colour options , they want corporate colour and slogan somehow implemented in the new design . Um , everything , all their sort of uh you know the uh corporate website and everything's yellow . And the logo uh the sort of slogan we put the fa fashion in electronics uh Okay , so , we have to decide on which functions we're going to actually have . speech recognition potentially , flat screen interface , L\_C\_D\_ interface um we also want to limit the number of buttons Um so I mean a a the sort of inkling I'm getting from little bits of um web chatter that I'm getting sent is that they're quite interested in a T\_F\_T\_ display , interactive display . Um glow in the dark , is that sort of with a light inside it or is it sort of glow in the dark material ? But if we add speech recognition as well as glow in the dark then both these factors will help their locating the remote control , I know of no products um that use speech recognition well . but what about um something that's built into the T\_V\_ um that you can press and it'll send out a little signal um that that will activate the remote control starts to beep . You just say you know , um whatever you whatever you want the remote for , you just shout your command to it and it would do it for you if it's within you know , within hearing range . I like the whole sort of remote feedback thing . we can still use the glow in the dark as a gimmick essentially , and we can have sort of a a a trimming as well , of the glow in the dark

material , just as gimmickyness . there's a good chance the the T\_F\_T\_ screen would break or uh get damaged . So we'll stick with sort of programmability um for the buttons that we do have . Uh maybe Raj you could find out what people would think about that , Um I think we're gonna scratch the speech recognition as a bit of a Oh no it's it's much cheaper than the T\_F\_T\_ , it's just a microphone and some some integrated circuits . so we'll go with speech recognition , yeah ? Um , speech recognition , limited buttons , organic design . Glow in dark . if it's not too expensive s I think it's a good gimmick . And also , integrating the , remember to integrate the logo and the s slogan . getting strings of um information , I'll try and forward any specific to anybody in particular , What I thought as well about the material is um maybe not this kind of material , but maybe more like um this kind of rubbery material , Um , a bit more durable and that can also be ergonomic So we have to safety point of view also , we have to take care . And I'll see if I can argue with boss about putting the We put the fashion in electronics Okay , that felt a bit more like a something with order and and reason to it than the last one . Oh , everybody needs k questionnaire .

## Complete Meeting Transcript

Okay. Okay. Mm-hmm. Wow. So, sorry I was just gonna say, what was the question for this? Or is are you coming on to that? Okay. So these percentages are are what? Hmm. Mm, mm. Mm-hmm. Mm-hmm. Yep, sure, that's cool, um Yeah. I can turn my computer quickly if that's okay. Um, yep. Okay, and then what do I press, F\_ eight? Oh right. Okay, cool. Oh. Yeah. No signal. Okay. Cool. Okay and then how do I press the the big one, to get it on to the big F\_ five and I press that again to get it off as well do I? Okay, so um I'm the interface design designer, User Interface Designer sorry, uh I'm concerned with um w what effect the apparatus should have on the user and um I'm I'm also I want to point out that our motto, put the fashion in electronics, so obviously we as a company we want to make our products trendy and fashionable, it's a big concern of ours. Okay, and how do I press n just the next button? The arrow? Okay. So um I looked at existing designs and also um the information that Raj gave us was very useful about what people like, what people dislike. Um and what people fashionable, because we said people between twenty five and thirty five were the main um buyers of of our T\_V\_ I think. So um what they like and what they find fashionable. And ergonomics, we said um, I don't know I haven't actually been able to do any of this myself, but um maybe that comes up, I don't know. And the findings, well the basic that was the basic function to send messages to the television set. That's what people want to do. Um, so they need to be included, um, but I've got some pictures here of some leading ones. I don't know how to get to them, do I press F\_ five is it? escape? Oh okay, cool. I haven't got my glasses on so I hope it's this one. These are two leading um remote controls at the moment. You know they're grey, they've I mean this one's got loads of buttons, it's hard to tell from here what they actually do, and they don't look very exciting at all. Um, personally I prefer this one just because it's looks easier use, it's a bit more sleek with more of this silver stuff, um, but there you go, that's what we're up against, and I think we can do much better than that. Um hang on. F\_ five, okay, sorry. Personal preferences. Um, well I think we need to I I think the ergonomics is quite um important, um Uh-huh. And um I thought not too edgy and like a box, more kind of hand-held more um not as uh computery and or organic, yeah, more organic shape I think. Um simple designs, like the last one we

just saw, not too many buttons and as Raj pointed out, only ten percent fifty percent of people only use ten percent of the buttons, so I think what we can miss out on the buttons we can make up for in design and and how nice it looks. Um, hand-held and portable I think is portamint is important because T\_F\_T\_ have just um released um I think is it a a remote control for presentations or uh and a big seven inch big screen, anyway, so um Yeah, no seven inches isn't that big but um anyway um so hand-held and portable and uh m I thought about other functions for T\_V\_ but as you pointed out people don't actually want that, so maybe we forget about that. It's for one T\_V\_ oh right okay, sure. And so the last thing I thought w which I quickly mentioned in the other one was maybe a bit of a gimmick to set us apart from other people, like glow-in-the-dark um which does already e exist but it's not very widely used I don't think. Easy finder with the a whistle function or something, or rechargeable station because it's a pain when you run out of batteries. And I think that, yep, that's it. Okay? Mm-hmm. Um, I haven't been able to Mm-hmm, yeah or some sort of voice Yeah. Mm-hmm. Yeah, something. Oh you need to twiddle the thingamibobsy thing. Okay. Mm-hmm. Mm-hmm. Mm-hmm. Yeah sure. Well I like that design. Yeah, not a problem. Mm-hmm. Or a little base station or something,. That might cost more though, 'cause obviously with batteries we don't need to provide,

well we provide the first batteries, but it's more, it's that's cheaper to just provide batteries. A battery in it, kinda. Okay. Okay. Mm. Mm that's a good idea actually I like the programmable options. Mm 'kay. Mm-hmm. Okay. Corporate colour. Okay. Mm-hmm. Yeah. Okay. 'Kay. Mm-hmm. Mm-hmm. Although the the danger with that is, it could look a bit cheap. Yeah. Well Mm. On the number of buttons, kind of functions and stuff. Mm-hmm, okay. Okay, cool. Mm-hmm, mm-hmm. Mm-hmm. Yeah. Yeah. Okay. Um Glow in the dark material I was thinking. Um, so I I guess that would be cheaper than a light I think. Often lost s was that, yeah. Mm-hmm. Mm-hmm. Mm-hmm, mm-hmm. Mm. Mm-hmm. 'Kay. Well what about this might get a bit too expensive actually, but what about um something that's built into the T\_V\_ um that you can press and it'll send out a little signal you know like the ones that we can't hear or something um that that will activate the remote control starts to beep. If you find if y Yeah. Mm. Yeah, that's the only thing, yeah. That comes with our remote control. Yeah. Mm-hmm. That could also be built into the T\_V\_ though, which might make our remote control a bit obsolete. Yeah, okay. Mm. And the expense. Mm-hmm. Mm. Maybe not even all of it 'cause we said um colours and fashion w were important so maybe um just like a little I line that's kind of around the outside and then you can make the rest a different colour. Mm-hmm. Mm-hmm. Yeah, 'cause what I thought, main Slogan, yeah. Right. Mm-hmm. 'Cause yeah, that w more than finding it, that was more like you know if you're watching a film in the dark, you can um still see the remote control. That was more of a a gimmick. Mm. Yeah, unnecessary. Yeah. Mm. So is that one of our definite requirements that they wa that it needs a T\_F\_T\_ screen? Yeah you think so? Okay. Mm-hmm, that's cool. Um if it's not too expensive s I think it's a good gimmick. Mm-hmm. And where is it sorry? Oh. Okay, cool. Okay. Okay. What I thought as well about the material is um maybe not this kind of material, but maybe more like um this kind of rubbery material, it's a bit more bouncy, like you said they get chucked around a lot. Um, a bit more durable and that can also be ergonomic and it kind of feels a bit different from all the other remote controls. The rubber rather than Mm-hmm, mm-hmm. Oh I think wi with the more organic shape of it it won't be as it won't as have many sharp corners as that, so that's something good, um I dunno, I mean That's a good idea. Interesting. Yeah, d with the colour, um does it have to be all yellow, do you know? No. Yeah. Having a little bit. Okay cool. Mm mm. Mm-hmm, okay. Cool. Oh yeah, that's a good one that. Yeah so. Wow. Has anybo oh. Has anybody pressed okay, it vibrates. It's pretty cool. Yeah, got small writing. I don't wanna waste it. Yeah. Yeah. Um. So how S Sh do you want me to hold it? So, after

that? F\_ eight. f oh sorry F\_ eight. Okay. Yeah. Yeah. Uh, me again, Rajan the Marketing Expert. Uh, as we have decided in the last meeting that I have to find out, sorry, yeah sure. Yeah, yeah. Uh actually, sorry I have to see the other, sorry. Yeah, thank you. Uh, yes, I have to look at the uh market potential for this product, uh, like consumer likings and everything, what is the potential for this product and are we able to achieve our a net profit or our aims or not? Then Sorry. Okay. Yeah, I can, okay. Uh then uh the methodology I adopted to find out all this was market survey. A a detailed market survey on consumers was done to find out their likings and dislikings, what they prefer what they not prefer, w what problems they do encounter in all this type of things. And what we got was, we found that if you uh, what they th what problems they are having with different uh remote controls available in the market. Seventy five percent of users they do find it that the remote controls available in the market are ugly. They are not so good looking. So, we have to put stress on th

is, uh we have to take care of this fact also like our design, uh should be appropriate, should be good looking for the consumers. And yes that's wi uh this will definitely, this can definitely put uh uh enhance our sales. Uh and even uh the good thing about this is that eighty percent of users they are willing to pay high uh pay more for this uh good looking remote controls also. So even if the available market goes for the available uh even if the market goes for the available remote control is less even then we can sell it at twenty five Euros, which maybe which may seem quite high but if our looks are are if the re remote control we design have a good better uh better look uh designs, then we can hope that consumers will prefer these g remote controls. Then And the second thing, some some companies they think that they should have more and more functions of the users uh or in their remote controls, but rather than those having more functions in the remote controls we should emphasise what actually consumer want, what they operate, rather than making it too complicated. Because mostly it has been found that fifty percent of the users they use only ten percent of the buttons, so there is no point of having ninety percent buttons making the remote controls too bulky, too complicated too expensive a because I think I believe that technology is useful only if uh the consumers they want to use it. Otherwise there is no point of having all this type of things. So this will not only reduce the cost of our remote controls but it will increase our profit also. So we have to take care of this fact also. Then. Uh it was function I want to go to. Uh, escape, okay thank you. Then if we look at this slide, uh these are in your shared documents, you can see, like Uh, sorry. Ah t look all the market potential, what uh how we should design consu our remote controls, what they should be there so as to en enhance our profit, enhance our sales. Yeah, these are different age group persons like uh sorry, I can open it in another way. Uh, yes. If we look at the costs whether the consumers they are willing to uh pay more for speech recognition in a remote control or not, we can find that they up to a thirty five years age group we have a very good disliking for this uh this uh point, like for speech recognition in a remote control. So we can emphasise on this point also like, because it will definitely enhance our sales in this ag in this particular age group from uh fifteen to thirty five, and I uh and I think that most of the users of the rem uh T\_V\_ are belong to this age group. So we should look Yeah. We can look at that that factor also, so yes. Yeah. So, and And then Yes. I think so. Uh if we look at this data how how uh h how what are the problems the consumers are facing with the existing remote controls in the market. They find that thirt uh thirty five percent uh thirty four percent of the consumers they find too difficult to operate a remote control. So it should be in such a way that it should be easy to learn how to operate these remote controls and we should provide pl uh spe uh proper manuals for its use also so as that people consumers could easily learn. They need not to have any, much technical knowledge to see uh to know how to operate these remote controls. So this is also a very goo uh major factor to loo uh take into

consideration to enhance our profits and sales. So um this is all about uh market potential by me. Uh, yes, th thank you. Yeah we have to take that out. Sorry. Sorry. Uh sorry, I have. Brian, this one also I. Yeah. Thank you very much Brian. If you want me to help, yeah. Yeah. Uh F\_ eight. Function F\_ eight. Mm s. It's not coming. Function F\_ eight, okay. Yeah. Computer. Computer adjusting, yeah. Yeah. Escape. Yeah. Yeah. Exactly. Yeah. Yeah. Yeah. Hmm. Fifty million was uh prof As a profit. Yeah, me too. Yeah. About cost. Okay. Uh. I Uh may I say something about? Uh actually I think it's really really very impor

tant point uh as if we look at the market because people mor fifty percent people they find that the remote controls are often lost somewhere in the remote, in the room. But yeah are lost and means they forget where they have kept the remote control last time. But if we add speech recognition as well as glow in the dark then both these factors will help their locating the remote control, like if they come and speak something at the remote control uh replies to something something and it glows in the dark. Both these factors uh both these points will help them to locate the where they have kept this remote control, and this will definitely enhance our uh market sales, so we should take it into consideration also. Yeah. Totally, it takes cheap speech recognition, she they wi Yeah. Glow in dark. Here? Sure. Uh it is in shared documents? Project uh projector. Hmm. It is not giving anything. Shared documents. Um but we have to take care like But we have to take care of our children also if they means if children catch hold of your or if they chew it it shouldn't be too harmful. So, whatever material we use it should be yeah. So we have to safety point of view also, we have to take care. Yeah. Small logo with the like a small yellow strip or y yellow with the logo in it. Yeah. Hmm. That's good. Check here. Um minutes from the last meeting which were essentially that we uh had decided on roles for each of you, however, um there are some changes that I've got from on high that um are a bit uh well w what I didn't actually realise it was that the uh this is for a specific television. So the all in one idea goes out the window. And they require that the uh actually I'll get to that at the end point number four, um we'll get what you've got and then we can see what we can adapt from it. So um, presentations, were you anybody got, raring to go? Raring to go? Okay. Good stuff. Mm. Oh I need to plug you in. Just about. Uh there we go, just screw 'em on in. Gonna have to swap them round so now, it was function F\_ eight. That's the wee blue one. Blue one F\_ eight. Should do it, good one. Hold on, sorry. and if you just click that it'll go ahead, one at a time. Sorry, uh. P press F\_ five to start it first. Jesus. Excellent. Oh you wanna go back? Just escape. Okay. Okay. Okay. Speech recognition. Hmm. We're als we we're looking at who buys it as well. Uh, which I think the twenty five to thirty five is uh usual, sort of. Fifteen to twe Okay. Okay, thank you. Um, follow on with Helen? Yeah please. Oh, so we do yeah. Fun and games. Don't know if the cable's gonna be long enough. I think I just kicked over whatever it runs on underneath as well. Okay. Function F\_ eight. Hmm. There you go. Uh F\_ five. Um, F\_ five and escape'll bring it back and just uh the left button for advancing. Uh just a left uh left mouse button. Mm-hmm. Okay. 'Kay. That can come under Arlo as well. Uh. Uh if you if you escape then you can see your bar. Uh okay. 'Kay. Mm-hmm. We hope so. Yeah, particularly if we've uh there was a bit in Raj's about R\_S\_I\_ and things as well. Organic. Mm-hmm. Sales,. Okay. Yeah it's like a, yeah. It's. Right. And also the company want to keep it stuck to the T\_V\_ for uh to keep down the production time. Mm-hmm. Yeah. Okay. Yeah. That's cool. Um, do you have trouble whistling? Really? Ooh. Yeah, I suppose that's true. Well I suppo uh you could y you could have the you could have the basically um instead of a whistle if it's got the voice recognition you could have it just, you know, where are you?. Hmm. Sounds good. Function F\_ eight for the um the uh Yeah. Alright. Let's remember that. Mm-hmm. But sure surely that would have to be um sort of specific rather than above a threshold 'cause if you had a loud movie on you're likely to get it beeping back at you. Sorry I

didn't mean to derail you there. Ah is that what that is? Well that's cool. If you if you can build space craft you'll have no problem with a remote control, yeah. Right okay. Is th

at just switches on the speech recognition and it's entirely speech operated, is it? Yeah. Yeah. Ah now it's fifty million Euros we've gotta uh we've gotta make profit, so we're making that at twelve and a half Euros a time. Okay. Would it be possible to have the rechargeable idea? Is that gonna mark up a lot? Yeah. Yeah, yeah. I mean if you think about these base stations now it's essentially just a lead with a sort of self connecting brake in it, so I don't think it'd up up the price that much. Okay. Okay. Right. Yeah. 'Kay, thank you very much, um I'll take that back. Right, also so um a notice I got not very long before the meeting, so didn't manage to forward it on to you, it is let's see, I'll find it myself, um Ta nah. We had that um to dis-include teletext um because it's become outdated, and everybody uses the internet anyway. Um, dunno what Oracle would have to say with that but never mind. Um it's only for the television, which I'm presuming means it's for a specific television, and um instead of colours and sorta colour options, they want corporate colour and slogan somehow implemented in the new design. Yellow. I presume. Um, everything, all their sort of uh you know the uh corporate website and everything's yellow. And the logo uh the sort of slogan we put the fa fashion in electronics uh I don't know exactly how sort of incorpor I mean, I guess if you're going for a sort of globular shape you could kind of have it working its way round it or something. Uh, where am I? Okay, so, we have to decide on which functions we're going to actually have. Uh, now, we had as listed options we had speech recognition potentially, flat screen interface, L\_C\_D\_ interface um we also want to limit the number of buttons so we'll pretty much take that one as read. We'll use the the basic functions for a television. No teletext. Um okay hold on. Not enough buttons you mean? So sorta strike a balance between a a few and a or it looks like we're just cutting on the um I do however have this from over my head, that they don't want teletext on it. Uh maybe Raj you could find out what people would think about that, or maybe they'll send some information about that, about um what people, whether people would require um teletext in a remote teletext option in a remote control. Okay um. So uh I take it your position Arlo is that the bells and whistles we've gotta come up with the a gimmick but not too complicated a gimmick. Um so I mean a a the sort of inkling I'm getting from little bits of um web chatter that I'm getting sent is that they're quite interested in a T\_F\_T\_ display, interactive display. However that does sound a bit like the more complicated design that rav uh sorry Raj um said people didn't like. Although I guess if there's a sort of If you think about standard interfaces that people use already, sort of Windows-style drop down menus or whatever, I think maybe that's a bit, going a bit far but you know like in a basic sense that you could have your basic selection of buttons, and if you hit a sort of menu at the top you have um it goes to a different selection of buttons, so it sorta keeps it simple. Um glow in the dark, is that sort of with a light inside it or is it sort of glow in the dark material? Okay. So Yeah. Yeah. Lost, yeah. That's cool. That's cool. Okay, cool. Um speech recognition I take it I don't, I've I know of no products um that use speech recognition well. Really? Mm-hmm. Yeah, or a yeah an advert an advert for B\_B\_C\_ two on B\_B\_C\_ one'll switch the channel for you kinda thing. Mm. Uh-huh. Ah, that's a good idea. So like a kind of backwards remote from the telly. Right. That we should just stick on, yeah. Yeah. And that's a sort of basic R\_F\_ kind of frequency so it'll be cheap. Uh-huh. Yeah. It might do us out of a job. Um Okay. I like the whole sort of remote feedback thing. Um so I think rather than and that also kind of takes out the speech recognition in terms of the interference of it

not working very well and things like that, so I th yeah and expense and the time. So I think if we're going to go well I mean like the thing about the there's the problem with the T\_F\_T\_ or the L\_C\_D\_ kind of thing is if you're also wanting the the kind of uh organic globby sort of feeling to it then you might

have trouble incorporating the screen. Um, but I guess not I thin we'll just we'll just pretend that's not a problem. Um uh and how are you about the glow in the dark material? Is that Contrast contra well. Yeah, okay. So if it's dow it's d uh yeah. Or if it's down under the couch cushions um which is where I usually find mine. Um Okay, well we can use we can still use the glow in the dark as a gimmick essentially, um if we're gonna have to if we're gonna have the logo on as well, bright yellow logo in our our um slogan. Uh then you know they're gonna be fairly brightly coloured anyway, and we can have sort of a a a trimming as well, of the glow in the dark material, just as gimmickyness. Mm-hmm. Alright, so n sorta if if we're gon if we're gonna go with the idea of um uh of feedback, sort of remote finder, then that kinda stuffs that one out then. Do you think? Uh it makes it fairly unnecessary then. Okay. Um, okay so scratch that. Uh so we've got do we want to go with the T\_F\_T\_ idea or the is that far too expensive? Well I mean I think I think the sort of find the finder things I mean it's uh I could probably write the circuit diagram for that myself. Um Mm-hmm. Okay. Um no, I mean that was going on ravs uh Raj's sort of um marketing research I guess. Um Uh So we'll stick with sort of programmability um for the buttons that we do have. Um. So that's sort of included in your sub-module kind of stuff, um Uh you were finding out about teletext. If you could find out that uh Um I think we're gonna scratch the speech recognition as a bit of a um expensive, no? Oh right, okay. Is it not the circuits that cost Oh right, okay. Uh well that kind of takes back the R\_F\_ the R\_F\_ remote sort of idea as well. Um. Five minutes. Okay. Decisions. Uh, votes, let's vote. Who wants T\_F\_T\_? No-one does. Excellent, so we'll go with speech recognition, yeah? Um, speech recognition, limited buttons, organic design. And what else was I thinking of that I haven't written down and therefore fallen out my head, programmability. Uh Uh o okay. And also, integrating the, remember to integrate the logo and the s slogan. Okay, so. Um can you put all these reports in the project documents folder if they're not already in there as well. So, it just helps me summarize them. And um I'll put any I'm I'm putting anything I do in there anyway, so uh Uh pro uh project documents. On A\_M\_I\_ scenario controller. Where am I? Project documents, yeah, it's on your desktop as well. And I will tr getting strings of um information, I'll try and forward any specific to anybody in particular, as soon as I get them now, rather than I was about to sort of tell you about the changes before the meeting, and then the meeting turned up, so I did. So Okay. Yeah. More sort of um flesh-like than plasticky sort of. Oh no, ethics, that's gonna cost us money. Okay, safety. Yeah. It sme smells good for children. That sounds, yeah it's gonna have to be it's gonna be have a big yellow foam ball, yeah, sorry. Please God no. Um. Well, I wouldn't th I mean, my reaction to an all-yellow remote control wouldn't be anything other than horror, so I think just having it surrounding the logo. Yeah. And I'll see if I can argue with boss about putting the what was it? We put we put fashion into Whoops, it's not working. Can't believe I've forgotten it. We put the fashion in electronics. I bet that'll catch on well. Okay, any last worries, queries? Okay. S s I know what you're thinking. Okay then, lunchtime, yay. Okay, that felt a bit more like a something with order and and reason to it than the last one. This is quite fun actually. I really don't Yeah, yeah. Wow you've your first page. I

was just writing really big. I've finished the meeting now. Oh, everybody needs k questionnaire. It's a inspired design. Hmm. Of course. So uh, I noticed your talk about speech recognition and whistling, and uh I was just curious to know, have we done any research into how many people can whistle? Um, or if is that a function we want in the remote? I don't, but I I know a lot of people do right. Yeah it just I mean it has to be a certain kind of whistle too, right? That's costly though. Um a much easier thing is just any loud noise like clapping um, shouting, you know, uh and then, what would the response be? It beeps back at you or something? Okay. Well, uh let me set this up. So I plug it in, press F\_ five? Function F\_ five? Or function F\_ eight? Okay. Okay. I think it's uh just to lock it in. It's got it. Okay. Um.

So as the Industrial Designer my job is to take an input from you guys, um so it's good you went first, and I jotted down some notes as to what are the b needs and uh what kind of novel features we can add to differentiate our product from the others. Um so Raj told us that uh consumers are willing to spend more for fancy products, and um he also mentioned that uh the current products don't always match users' operating behaviour. Um, a lot of the buttons aren't used, and uh he mentioned that they're not fun to use. And uh a novel feature which uh we just brought up was this this automatic speech recognition feature or noise detection feature for when you lose the remote, there could be a little microphone on it, and any noise over a certain threshold um it'll pick up as a a distress signal um from you and it'll beep back and say you know oh here I am or something of this sort. Oh yeah, yeah, that's true. Well maybe you could have a um hmm tha that would be a consideration to take into account yes. Um. Yeah well tha that's uh for later down the road um, and then as for the user interface it should be trendy, um and not computery, right, so more low tech and not too many buttons. So I took these all into consideration and also I have some limitations from the boss. Right um, and practical limitations which I kinda threw out the window. And so I did a little research and unfortunately all I had to work on was our uh our corporate archives of the great products we've made before, which include, you know, um space craft, coffee makers, and bullet trains Or uh or a high speed train. Right and having personally worked with all these products uh I have a great deal of experience with uh with industrial design of these. Right. So, I figured, just put 'em all together. You got a a caffeine powered space shuttle train transport to your T\_V\_, and um as for the user interface problem, you know, too many buttons. Give it one button and and it's a you know, for the the cowboy in all of us I I'm not quite sure what the the function is there but Yeah it's a g I mean you could have a you know a Right. So I think I I missed the budget thing, it was fifty million Euros? And we gotta sell twenty five of them? Right. Okay. Oh okay, so I I mixed those numbers. Okay. Well I guess more realistically then, we need a product that's got some kinda nifty outer casing, cheap plastic uh, you know, um that should be just like uh a tenth of the price maybe or less. An energy source which'd probably just be uh your regular batteries um, we don't wanna have it Uh. Yeah, yeah, we could do that too. Um, I hadn't thought of that. Yeah. Right. Right, so so the unirs the user interface uh the canonical user interface for these would be just a bunch of buttons, but since we're a cutting edge company, we uh of course will have alternatives like uh speech recognition, whistling recognition and rocket power behind our product. Um and lastly the transmission interface is uh, just some engineering thing you don't have to worry about. Um so here's you know, a great schematic that my uh apprentice designer gave me. Um as you can see the the remote control hav

e parts and those parts look like that and um you know it's got a little operating procedure that looks something like that. And I suppose you all know how it works because we've all used it and we wouldn't be in a company designing remote controls if we didn't know what they were so uh personal preferences, I think uh programmable options which um just require a small amount of memory, uh non volatile memory, just um so the user can put in their favourite channels and maybe their preferred volume settings so that when they turn it on it's not blasting. Oh okay. And the uh, the bells and whistles that we mentioned you know, they take more budgeting, um more technical uh expenditure of effort and it's also much more likely to not work if if we add these bells and whistles. That's all I got. Ooh that's tight. Okay, I don't think we need to screw it in. Just push it. Yellow. Yeah yeah. Well hmm. Oh it's They're act there there was a remote control that came out two years ago that had a some basic speech recognition on it. You could programme it with your channels and then you say you know like uh B\_B\_C\_ one and it goes to that channel. Yeah, it didn't work very well though because of this noise

interference problem. They mentioned you know if the television says you are listening to B\_B\_C\_ one. Right, right, and so there was a lot of this, you'd be watching the T\_V\_ and then all of a sudden it'd it'd pick up a noise and turn it off or you know or turn the volume off or something, but if you can work around that that noise problem Right. Right and then it would do just you know, uh subtractive kind of cancellation of the noise. What you could do then would be you have uh a remote controlled by the T\_V\_ speaker, or not a remo I'm sorry, a microphone by the T\_V\_ speaker and a transmitter there that sends back to your remote, 'cause you can't um expect uh the the television manufacturers to to put that feature into their T\_V\_s. But yeah, then you have like the little se separate module by the T\_V\_ speaker which Right, and then the remote control would know um what's being produced by the television. Right, right. Right, right. Um. Yeah that's certainly possible then an another thing was about this losing the remote and trying to find it again. If you do have this sorta speech interface to it, you don't even need to find it. You just say you know, um whatever you whatever you want the remote for, you know to change the channel or to uh turn the T\_V\_ on and off, you just shout your command to it and it would do it for you if it's within you know, within hearing range. And uh you know it could be somewhere in the room y that you've no idea where it is and it would still do its job. Well, hopefully we're uh we're ahead of the curve. Hmm. Um. Mm. Yeah, no th the material's cheap but it's just uh the the glow in the dark material needs some light to charge it you know, and then uh if you're, if you're sitting in the dark for too long it uh it won't glow any more. Right. Right. Mm-hmm. Um yeah we're getting a lot of features now, I I think Yeah. Well, I think a consideration too is that these uh remotes get abused a lot, you know they get thrown around, there's a good chance the the T\_F\_T\_ screen would break or uh get damaged. They're pretty fragile. Yeah mm. Oh. Oh no it's it's much cheaper than the T\_F\_T\_, it's just a microphone and some some integrated circuits. And it'd it'd be a small vocabulary speech recognition system, like a Okay. Yeah. Yeah yeah. So it should be when you save on your desktop, so it goes save as, or And then uh hit that little folder up thing again. Again. All the way to the top, yeah that's up to desktop. Right and then project documents. Mm. Did you get my email? Okay. Just making sure. Yeah. Wow. We could go comp yeah. We could go completely out of the box and make the thing a big red ball foam ball. And it's got the thing on the inside. And there's no buttons at all, it's always on, and just yell at it, and it

works. And then ch children will love it. Oh yellow, yellow ball. Right. Twelve thirty. Mm. Yep. Yeah I've been using up the pages. Another questionnaire.

---

# Meeting ID: 80

Data Source: Train

## Executive Summary

The Project Manager reviewed new requirements for the project with the group and discussed their implementation. The Industrial Designer presented the basic components of a remote control device and how they work together. He showed that the size of the chip they will use is dependent on how many complicated functions are included. The User Interface Designer stressed that the project should focus on a simple design for the device. The group discussed not being able to include a teletext component, and that the product design would have to be the main selling point of the device. The Marketing Expert discussed his marketing strategy for the project, again stressing the attractiveness of the product design. The Industrial Designer proposed including a battery charging stand with the device but it was decided that it was not a useful feature. The group continued to discuss the marketing strategy for the device as it would not include many advanced technological functions; they discussed including a guarantee for the remote and using a unique form factor.

## Complete Meeting Transcript

Yeah. Well uh what comes up for me is that if we're gonna if we're gonna be marketing a product that is going to be uh having no teletext, people are very comfortable with the idea of having teletext and using teletext, and so we're not we're gonna be a new product without something that people are very comfortable having right now. So that's, from a marketing perspective I I see I see a lack. And so we have to go, I think, in the other direction. What are we gonna have that makes this thing better than Right. Yeah. No, I I agree with you. So what I'm talking about is I see that one side we're eliminating something so we have to come up with another side which is, what are we gonna be targeting our market uh that identifies our product as better than because it doesn't have teletext it has ta-ta-ta-ta. So that's that's that was my reactions. Yeah yeah. Yep. Okay. Yeah. 'Kay. That's right. I think we take with you. That's what I'm that's what I'm talking about is is that we have to find something that is gonna be very attractive about this product 'cause somebody, some people are gonna be hap unhappy 'cause it took they can't ac access their teletext. Okay. 'Cause we're talking about eighty percent or ninety percent or ninety-five percent of the televisions out there are are teletext. So so it's it's not that I'm

criticizing the product at all. It's just when we eliminate that then what do we bring? What are we bringing in to take the place of this, and we have to do in my opinion we have to double up. If we lose one we need to bring two or three. So you have this? Now is would this be considered just a standard uh um This is not this is not cutting edge technology we're talking here. We're talking about existing technology. Nothing is being modified or upgraded or new discoveries. Okay. Okay. N okay. Mm. Mm the shell? Okay. I have maybe a silly question. I in the very beginning it said with the with the advent of computers there's gonna be the it's gonna be out-moded teletext. I I don't understand how those two things are connected. How does how does computers and teletext h how why is one eliminating the need of the other? I don't understand that. Okay. Yeah 'cause, yeah, I just I don't see the cross-over between computers and television. I mean I do see the cross-over in some sense, but but but but with the the remote is is used for television, okay. So so if we make the cross-over and we're gonna view television on computers then we're then we're losing the the necessity of the remote. S Okay. Okay. Yeah I don't I don't see the logic. I I don't see the logic in elimination of teletext, I just I I but I'm not a tech-mind either. I just don't see the cross-over between computers and and 'Cause we are designing something for a television, okay. We are selling it to an existing market. That's Yeah, and and, yeah, and and we're also marketing a product. It's what I'm seeing is a is a mid-range cost product. So so w we can't go and pump a whole bunch of technology into this thing because all of a sudden we are gonna have cost overruns. So if we drop if we are gonna choose to drop teletext, again what are we adding to the product that makes it marketable? I don't I don't see it, and to me if I'm gonna market a product for b for beauty for for design I'm gonna I'm gonna try to market it at a much higher price. I need to make it special with a high price tag. I don't want to make it economically uh g uh competitive. I want I want to market it as exclusive. So I would market this product it at eighty-nine Euros and come up with some really beautiful exterior design or something th but but I don't think we have that flexibility. No I no I I understand what you say, but what I'm what I'm, okay we probably need to move along, but my my concern is trying to find a marketing niche for this product, and if I'm coming in with a with with twenty-five Euros, which is mid-market price, um then what am I going to give these people for thi

s? So that's just my question, but we can keep talking. Yeah. Oh P Pedro, I just want to say quickly I I would really like it when you can come up with some more bells and whistles, eh. You know sell uh things come to my mind is uh uh something that's uh um voice-activated. I know we're getting into some, I hope, some big money on this thing, but Is that for over here? Okay, alright. That's 'Cause uh and I think of voice-activated I think of of how many times I've I've lost my my remote and I can't find it. So some way that I can I can find my remote by clapping my hands or something uh and and so so um But this 's just something. I'm trying to find some bells and whistles 'cause when they talk about tel taking out teletext, it's like, what are we gonna put in? What makes this thing attractive? And it's only for televisions. So we everyth our our competition out there has got these these multiple adaptors where they can use 'em for their V\_C\_R\_s, their D\_V\_D\_s, their their televisions and we're coming out with one remote for television only. And so to me we have to make this a really special product I I I don't s I really have to say I don't see the market niche for this product. At this price I don't see it yet. I'm I I go along with this, because this is what we're given to try to market, but I I don't see the market niche for this product without without some really sort of something really special to identify it as as unique in the market. Yeah. Okay. Have to do you have to do it in the box? Okay well, so so that's up to you then to to make this box in something that's absolutely extraordinary. Maybe make it in the form of a gun. We can sell it in United States. Well you know for marketing f marketing for me is uh and uh how do I go

here? Okay. Go go. Is that right? Ah-ha. Yeah, what for me is it um I d I don't know what I'm marketing right now, okay, 'til you spoke and when I wrote this, I don't know what I'm marketing. I just know that I I was identified as a a we identified ourselves as a as a developer, as a manufacturer, and as a as a um distributor t to other wholesalers. And so the th the twenty-five Euros that we've identified as the sale price is a wholesale price rather than a retail price. That's what we decided here. Um so what I did is I I decided that that this this needs to be a product in a in a sense can market itself. So what we've identified here as our main marketing stratagem is is in design. We're making the most beautiful attractive uh whatever we decide it is. So that means we have about seven more minutes or ten minutes left. Um so I would like to have a product that that we can sell easily. So I say inspiration, so having something beauty, something attractive, uh something that in a sense will sell itself. Uh innovation I think fits into what we're talking about here with design. Uh cutting edge technology, I don't think we're gonna have that, these were ideas I was putting together, um unless we come up with some New Age product a as far as the casing is concerned. I I wanna make this thing something that I can identify as special in some way, so maybe we can have some I I talked about environmentally sensitive, uh maybe we have a product that can be identified in some way as advantageous in a home. I don't know. These are just thoughts. Uh I wanted to talk about uh who we are as a as a corporation, that we're new, we're aggressive, we're competitive, we're we're trying to provide a product from a new perspective rather than from an old corporate line. So to me it's about selling d uh our identity our corporate identity along with the product. Um what I found is that the projected costs are competitive. Uh we're kind of in the middle of the market, but what I'm seeing is that the market is ready for I I identified new technology, but again, because what I see is budget restrictions and limitations, I don't know that we can bring any new technology into this thing. If if we could have a technolog

ical something Mm p please. Solar. But solar Blah, I like it. I like the idea, but we're talking about in cost is gonna probably double. But boy, we can sell this thing, because there's no batteries, it's environmentally sensitive, i we can identify it as a safer product in some form. Yep, that's right. I really see But the cost i No no. No no, we have t we have to change the end cost. There's uh I mean I don't see it anyway. Yeah, that's gonna be up to these guys. I my reaction is no, but Well, see I I see I I'm an advocate to make this an exclusive product. You know, let's let's sell this wholesale for for fifty Euros, sixty Euros. Let's make this thing really exclusive, environmentally sensitive, uh high-tech design, uh ergonomics, all of this. Just make this thing uh, yeah, the the the Rolls Royce of of remote controls. Every home's got to have it. If you don't have one, hey what kind of remote do you have? Oh you've got one of those, oh fantastic, I want one of those too. I just don't have enough money right now. Yep, one one thing I don't understand is h they've they've given us this package, okay. Now uh in my opinion we need to give them a package back, okay. They say they say okay here you go. They gave us a fundament a foundation of of what they want, and and w it's our place to kinda analyse and evaluate. I don't think it's our place to create their product for them, maybe it is. I don't know what kind of role we have in this in the corporate ladder uh, but to me it's like, okay, you have got your here's our ideas, okay. And then let them look at those ideas and they say, yeah well, we can we can raise the price twenty percent, you know we like this idea, this idea no, but to me it's it's about a choice, do we follow their directives or do we make uh presentations back and and then and then discuss? beca I I do not I do not see the market niche for the product that they're handing f handing us right now. I don't see it. Right. No I understand that. Nope, they've identified the product as not working for anything but televisions. They've identified this product limita That's why I say I don't I don't see the market niche for this. If we if w if we were going to have a product that worked for D\_V\_D\_s, V\_C\_R\_s and everything,

then I can see the market niche, but we we're only identified as going for televisions without teletext. And it's like whoa we ha in my opinion we have to go with something that's extremely exclusive to make this thing marketable, because who wants just a television remote? I don't. That's right. I I I have a tendency to agree with you. I really do. That's why I say I quest I q I question the marketability of the product. I really question where we create the demand. W okay if you if you drop the cost, now if you make if you make go to the other side of the cost scale, and you make it less expensive, then all of a sudden now we're going into an a a new market area. So we can say low-cost uh uh um uh good design, beautiful, wa-da-da-da-da. But what I'm saying is right now we're middle market. Yeah for for multi for a multi-function remote, that's a mid-market price. In a discount right now you can buy 'em on sale sometimes for about about uh eighteen, nineteen Euro, and that's for the multi-functions, uh D\_V\_D\_, V\_C\_R\_, uh catch-alls. And and they have 'em in a little box in the middle, and and this is the consciousness that most people have about replacement remote controls. So to me, to market this a t only a television remote control we have to change consciousness. We have to have something that will change people's thinking to identify this as advantageous, and I don't know what that is. It's gotta be low-cost or high-cost with with special design features. Or my d I mean I I well we g we're talking about the other end now. I like it. I like the idea, but we have t we have to find out Well. Mm. Well, I think again it's it we have a cost issue here. You know if we're gonna go in this directi

on, to me we're going to the other side of the cost range. Are we gonna make this selling selling the cost as a high high-tech uh um environmentally sensitive whatever, or are we gonna go to the lower side of the range? Again I don't see our market niche in the middle for our product yet. I don't see it yet. W a question I have in in a 'cause I I I think I agree with you on, we gotta make it a box. The box is gonna sell it I think, the outside, the casing. Can can can we have multiple designs? Have a modern, have a traditional, have a you know, and so so instead of them all looking the same, people can have maybe four or five different designs they can choose from. I don't know what that creates cost, or Yep one over another. Yeah, okay, I hear that. What ab what ab what about a a remote that's that doesn't maybe look like a remote? Just an idea. Just just okay 'cause I mean we all know what a remote looks like on the outside. They're selling these things everywhere. Maybe that could be part of our design exclusivity, is we make a remote that doesn't even look like a remote it it opens like a telephone. Doesn't matter, yeah. I'm just jus I talking about some something to make this thing unique. It That's the thing, I'm gonna keep thumping on. I'll sell whatever you guys design. I don't have a problem selling a product, that's not the issue. I give you ideas, you guys create the product. Once you have the finished product I'll find a way to sell it. Don't worry about it. I just give you these things now, because these are my thoughts and feelings. No no. One thing I just thought about when you were saying that, is that the p our target market is gonna be someone who has lost or broken We gotta stop? Who's lost or broken their their remote. So how many remotes do they wanna buy? Can we p can we sell them a remote that can maybe guarantee they will not need to buy another one? And so with with with this kind of system or locator or something, to to think about, how have people been been losing or breaking their remote? How does this happen? And and then and then design the product, maybe some component of the product that can identify this as the last one you'll ever need to buy. uh we can make it in the shape of a coffee pot. It's uh just it's that I think it's telling us to stop our meeting. So we have the c we probably have have on-line in our in our system, we have the ability to create this, we're talking about. A charging system. If if we can create this we have probably five or six or seven really strong marketing characteristics. No that's not what I want, I want Oh look it here. Yeah bu but we we're designing only the remote, we not design the T\_V\_. So uh we're gonna be removing the teletext out of any T\_V\_ that

we people use our remote with. So it's kind of a stupid decision. So then the double R\_ will be our our I tho I tho I thou I think Rol Ro Rolls-Royce might mind, but don't worry. Yes. I Hey mouse. Open. When we're fighting over it's also more lot more fun. Uh. This doesn't work. So yeah function design. Um you guys know me, Pedro, and um what I found is we want to do fashion and I think, honestly, we should keep technology low and just simple basically and try to aim for design. If basically a case will will cost the same if it looks good or bad so we ma we have to make it look good. Um something cute and small. The big chunky remotes are died in the eighties. So we should just go for something that people will like to actually look at. And um although mo most people will buy s televisions and everything for uh that have loads of loads of little functions and everything and they mostly end up using simple functions and little things and most the people won't won't get too mad of actually having to go the to the s to the television to, for instance, tune in their the stations. There's no need to have that in the remote. So um um as for what I would recommend for uh the the interface design, and uh I will change th

e colours on the on the logo, but um we should go for the user-oriented device, so simple controls and good ergonomics. Um and uh although I th I th I'm still here recommending the teletext so I'll remove that, I guess, but um we should go for the Yeah. Yeah the they're basically aiming at saying that you would use you know a couple of years ago teletext to be the easiest way to check like for uh uh the scheduling and the next programme and stuff like that and now Yeah and now you can c look it over Internet. But I still think teletext is way more convenient until until we have the same commodities. Yeah, but it's not happen yet. Yeah. Yeah but we we don't we're not aiming a command for that. That's the thing. And all of those require the other commands with more complexity and more software and Yeah but we would increase the price to try to make it a trainable one, so Well I dunno. One way the other teletext was there but I guess we can remove it or, you know, make two separate interface designs. Yeah. Yeah. Yeah. Yeah. Yeah but we're not putting some there's no no putting anything in in the place of teletext. That's the problem. Yeah. No just I I would I would advocate for continuing teletext and those would be the basic commands. Um as for, you know, the the case design uh maybe I'll come up with more concrete ideas. Right now it's just the idea of simplicity and slickness, cute and small um Yeah. Yeah mm. Mm-hmm. But we th that should be design. That should be the design basically. I think technology we'd we we're not in the price range to do it. We don't have the money to do it towards t f technology so we should we should aim at design. Yeah. Yeah. Mm-hmm. Mm-hmm. Mm-hmm. Yeah y y you you wouldn't The interface will be different. Good design. Uh we should keep it simple, mm medium-low cost mar um cost area and uh make it look good. Yeah, complicated but Yeah. Okay. Okay. Yeah. Yeah they are not simple. Yeah. Yep. Yep. Right. I think one of I think w, yeah, one of the things that we should also keep in mind um when we're doing this I mean our company's slogan is we put the fashion in electronics, right. So I think our kind of our target here is to have some kind of very like sleek nice look remote and we want it to be functional as well, but I think one of the main selling points is that we don't want it to be clunky like like this thing here. You know we don't wanna a big clunker. We want something that looks nice and it's fashionable and so That's fine. Okay so so you all know me, I'm the Industrial Designer. And we've some basic components that um our remote is gonna need, just basically every remote'll need 'em. We need some kinda of power d power source. Um we have to decide on our our user interface, which is his department, but the in user interface is also a major component. Um we need a programmable digital signal processor to um to take the input from the user and translate that into uh into electronic signal, which we pass to the infra-red L\_E\_D\_, which you aim at the television uh which and it receives that signal. You need a on-off switch um I don't know how that got in there. And uh we also need to um have the if we want a universal remote we need to

have encryption codes for the different makes of T\_V\_s. So we need to know all the different you know all the different signals and so that'll require some memory as well. Um so here's just a basic layout of how how the remote would work. You ha the v the power source is in the upper right-hand corner there, and you can see that uh we have the user interface here which is connected to the chip which does all our signal processing, and then passes that signal on to the infra-red L\_E\_D\_ and that signal is then emitted and received by the television at the photo-transistor. So those are the basic components that need to go into this and everything else is pretty much uh open to move around. I think any des No. Right I think Yeah this is just this is just a basic la

yout of ev of all the components that w w are gonna be absolutely necessary f to have a working remote. We can add things in like if we wanted some voice recognition, I mean that I mean that you can kinda say would would fall under the user interface and the digital signal processing chip. But Um well the most the most costly components are gonna be the chip and the uh th it could als basically the user interface and the casing are gonna be expensive as well. Um the L\_E\_D\_ and the the transistors and everything else are you know they're they're pretty cheap. So depending on what we want our functionality to be, um the chip could be expensive or it could be cheap. Um depending on the n amount of memory we need in there and stuff like that and h and h you know how much power. Uh I don't have any figures right now. We uh we have to wait until we get to a more specific design phase for that. Um but and I think a significant part of the cost could be the actual the actual casing itself and and you know the the b the buttons and things like that, I think. Yeah. Basically yeah. So yeah. That's all I have really. Click, don't Yeah. Mm-hmm. Right as far as i it's just uh the cost of an extra button. I mean software-wise there's really no difference. I think. Scheduling. Um to find out what what you're watching even if there's commercials you know. I think I ha I agree. Well for me Yeah. Unless you have a Yeah. Mm-hmm. I think a lot of that's proprietary anyways. You're not gonna be able to, you, like command a TiVo with our remote. I don't think. I think if it's possible you should try to you know have a talk with management about that. Just you know Right it's just not Yeah. Well Right. I'm just thinking you know with all these universal remotes that are out there, how many people how many people actually use every feature that ar you know i like these trainable remotes and things like that, where, you know, it's just so confusing to do to use all these functions. Where I think the largest portion of the market is just gonna you know they lost their T\_V\_ remote, they need another one that'll work with their T\_V\_. They want something that looks nice, that that that isn't gonna break when they drop it, that you know that maybe it's it's ergonomic, it feels good in your hand, something like that. I think that's gonna be where you're gonna find the biggest, you know, market share. I think the more bells and whistles we add, it's just gonna cut into our into our profits. Because I think as we as we add costs for things like uh for like if we add the voice recognition and things like that, I think you know what percentage of the of the um of the market is actually gonna use that? Maybe five percent, you know, and how much Right. Yeah okay. I'm sorry. Sorry boss. Yeah. Well it's kinda both of us. Us us user interface. Mm-hmm. I was thinking about that. Then your lights would go off, though. Yeah. Right. I don't I think all these things are pretty standard. I think we'll be okay. Mm you can just click. No no no you just get off that. You just click anywhere. I have an idea. And it's kind of along the s lines of environmentally sensitive, and it may even fit into ergonomics, and even kind of address the issue of losing losing the remote, what we were saying it's a common issue. Um what we can do is, well you know that batteries throwing a aw remotes run through batteries like crazy. Right? And s for some people Yeah. Well maybe not a solar remote but instead what about if we had like a power cradle? Like a a cradle that is is there to hold the remote when you're not using it, so you'll always know where the remote is 'cause you have to put it back there

to charge the remote, and we can, instead of having instead of having, you know, replaceable batteries we'll just have a power cell that stays there for the life of the remote. You never have to get go through the go through uh all these different batteries. And also you can I I think it's a go

od opportunity for the user design or for not just for the user design, but also for the just for the look and feel of the remote as as a whole. You know you could have some kind of neat little, you know, a sexy design for d a cradle and the remote itself. It w it would increase the cost. And you could page the remote if you lose it. Maybe there's a button on the cradle. Well what I can do is I can d look into ho well Pedro and I can look into how much this might increase our our costs and you can look into what kind of effect an increased cost is gonna have on our on our final numbers. I I Yeah. I just don't know about that, because in order to do that in order to price it at that kind of level I think we'd need to have every functionality that all the other competitors are offering like being able to operate, you know, the D\_V\_D\_ player and, you know, the stereo system and all that. Which is a pretty basic function that w we've opted out of. And additionally we're m maybe not supporting teletext um But I do think there are some basic features that we don't have that a lot of other remotes are going to have. Mm-hmm. I don't I d I have to disagree though. I think our market niche is basically people who need who have lost their remote or uh who've broken their remote and don't wanna send back to the manufacturer, they just wanna run out to the store and get a remote, and then they're gonna look on the shelf and they're gonna see ours is the nicest looking remote. It does what they need. These aren't I I think that it Right. Right. Mm-hmm. Right. Well here's Right. We he well here's my thing about that. If you're in the market for this ultimate remote, you're not gonna go for just a television remote. If it can't control if it can't control your your D\_V\_D\_ player and a al if y if you can't get that all-in-one ultimate remote, that just you can throw all your other remotes away. I'm not gonna buy a d seventy-five Euro remote. So I think what we So that's what I'm saying Mm-hmm. I think that's big. I think so, yeah. Yeah. What about um the idea that I had with the cradle? How do you feel about that? Or how does everybody feel? No, but I that's the thing I I don't think it's necessarily the other end. Mm-hmm. Right. Well it lasts it would last for several hours on its own power, but when you're done with it you put it back in the cradle. Yeah well it Mm-hmm. Mm-hmm. Well the the problem with that is we may end up with a whole bunch of inventory of a of a poor design you know. So Um but what we could do is some kind of well I mean Yeah we we need to, I mean, have a few designs to look at and then come up with something that I think we all agree is, you know, the best fit. I think w what's really important is it has to look good, it has to feel it has to feel good in your hand, it has to be durable, it has to a and I think it's really important that it doesn't look cheap. I think I think we have to make sure people look at it an and feel like it its like a quality remote. Even though the cost may be low. Mm-hmm. Or what if it looks like a pen? Yeah. A pointer? Yeah. Yeah. So just to touch on m my point one last time that I had brought up. Um I really un unless you guys are die-hard against the fact that um it's possible like it reduces the usability of the remote b and the fact that you can't lose it on your own, I think it still might be a good idea to investigate having like a power cradle. Because I really think i in a certain sense it almost like for me I would want to have that just, because I know at the end of when I'm done watching T\_V\_ that when I'm done, oh I better go find the remote and put it back where it belongs. Maybe th th th that's just some people that like that. A lot of people As a watch? Mm 'kay. Mm-hmm. That's what I was saying. Exactly. Mm-hmm. Mm-hmm. And also presumably they've Exactly. Yeah. True. Right. Yeah. The locator'll definitely be more expensive. Mm-hmm. Right. Right. I think one of the things tha

t we can put right on the box is, never buy another battery. You know, something like that. So we are here to talk about functional design. Now hopefully we've all got a better idea from than we did f leaving

the last meeting as to what it is we are up to now. So here's an agenda. Uh I'll open. Um you should know that I'll be taking minutes during all the meetings, as I was struggling to our last time uh and that'll be easier for me now because I'm not actually giving the whole presentation. Uh the additional points are just the stuff that we sent and that I forwarded on from upper management having a few bright ideas to make our lives painful. Um now you can all give your presentations. We can talk about the requirements and hopefully come to some decisions. Right, forty minutes for this meeting, so a bit more time than the last one. Here's the additional points I just wanted to put those in there to see if you guys had any comments on them. Uh did you all receive that email? So does anyone have any overall Mm. Mm. Yep. Mm. Well that first point could uh also be an opportunity because in seeing that teletext is becoming outdated, some sort remote control that can work with the Internet there is the opportunity that's presented, I guess. Okay. Okay. Yeah. but but we are sort of being dictated that this should only be for the television. So we're quite fixed. So we're really probably, in terms of marketing, are looking for that's uh that's a cost winner rather than a fantastic new feature product. Yeah. Hmm. Hmm. But there's also the potential for mark there's a market here for our lost teletext. For example someone that just goes to the shop that wants a replacement wants it as cheap as possible. Twenty-five Euros is the selling price, we really have to innovate here I guess. Mm. K yeah. Mm 'kay. Okay. Okay I think that the last point is probably quite uh straightforward. Obviously the the w it has to be branded. 'Kay. On the product yeah. Can you handle that black and yellow? Mm. Nah. So we have three presentations, and I think we'll go in order of participant number here. So we can have a look at the working design first from participant two. That's Okay. Mm it's enough. But uh click it on off? Do we have an idea of costs of different components? 'Kay. Mm 'kay. Do we have any ballpark figures for that yet? No. 'Kay. Yeah. Okay. Okay. Thanks. And we have participant three, which I believe is Pedro. I can give you that to click on. And you wanna get View a slide show, that's what you wanna do, yeah? Just go up to view. Mm 'kay But I t I think what the the management recommendation was less that there's a worry that teletext will become outdated rather than we shouldn't have it. So I I still think if it's cheap enough functionality-wise to include, it really should be in there. Because otherwise we're just going to I mean even if it's necessary or not, if you if you're given the choice between a t a remote with teletext or without uh when it really if it i if it isn't more expensive for us to k make because as far as I understand it, it can be operated with the same set of buttons, yeah? So it should be in there. Yeah. Okay. Isn't Well maybe what we're getting into here is the the idea of uh Internet through the T\_V\_ for example. So that might play on what we can do. Well you have digital T\_V\_ still already. Well there there is a for example on digital T\_V\_ systems you have you can press a button and you can buy things in adverts, and you can uh you can view through a catalogue for example. A a family member of mine has got a system where you just um you can Yeah, and there's other features for example on other systems where you can pause live T\_V\_ and things like that. They're just features from the Internet uh from computers are are coming into the T\_V\_ sort of under the covers, but you still use it through a teletext. So now the things to think here are that that there's gonna be more functionality, potentially that w

e can handle. Mm. But still there there's an opportunity. If if it's, for example, a trainable one then we're just simply having like an up, down, left, right, an okay button or something like that might might do as well in future proofing it. Mm. Okay. Yeah, and neither do I in fact. Bu uh. I'll communicate that back to those guys there a a and th the message really we wanna be sending to them is that, although teletext may become outdated w there's no I logic in not having it in there anyway i if it doesn't affect the price. Um but I I think what they're pushing us towards here is in terms of thinking of ways to future-proof our

system for future systems that have something else other than teletext maybe. I dunno I'm Mm 'kay. Mm. Yeah. Hmm. So if we're keeping it basic we're loo loo what we're looking to sell it basically is it's uh just being very easy to use, looking exceptionally good, that sort of thing. 'Cause we really don't have anything else there, do we? Mm-hmm. But i if design if design is cheap and functionality is basic, then twenty-five Euros is probably a high price for a commoner garden stan standard T\_V\_ so the place uh remote the then the place we're going to justify that cost is through through design through making it a sleek elegant high-priced basic remote. Does that make sense, huh? Mm. Yeah we probably should. We we're doing alright for time. Yeah. Okay. Sorry that kinda cut into you there. Mm. So we are looking for something that looks good and just works, rather than looking for any special features. Is that Mm. But we can talk a little bit more potentially in the marketing marketing presentation about this. Be a good idea. Uh sorry, I didn't mean to cut in. I'm not the boss. Okay. I think that's probably a question more for for this guy here, yeah. Is it? Okay. Mm. Hmm. Okay. I have a question uh for you. Does any of the um the features that Pedro's spoken about here have any implications we might not have thought about on in terms of just pure functionality? In terms of making it work or the cost of that or Okay. 'Kay. Cheers. Onto participant four. Mm-hmm. Mm. Yeah. Now the the question is can we make this for less than twelve-fifty per? We we well do we necessarily have to change the end cost because uh Can we dl can we do that without uh changing it twelve-fifty per product, if we basically can sell more based on this? Mm-hmm. Yeah we we can certainly push for a more expensive product if that's gonna be Nah, I think we can say with certainty now that we are supporting teletext. Mm-hmm. Mm-hmm. Mm. Mm. And and th to get to back to another point, sorry uh uh for cutting in but, I th I think it's important to remember that that this remote has to work with multiple T\_V\_s, yeah, 'cause it's selling on its own. It's not going to be specifically for Hitachi T\_V\_s or or whatever. So technologically, if I understand it, uh T\_V\_s T\_V\_ remote's working exactly the same way as video remotes and D\_V\_D\_ remotes. All you need to do is train them to the individual one, all you need to do is is know the the f like some four-digit code. So saying that it works with all T\_V\_s is equivalent to saying that it'll work with D\_V\_D\_s and other things. Oh okay okay. We have done this. I see. Mm-hmm. And I I'd Mm sorry. So we really can't chase that. We're really looking for something basic. The the one thing that that that you said really struck a chord with me here in that we're we're carrying the corporate identity with the product, but we're actually looking for a large profit at the same time where I'd be inclined to go back to upper-level management and say like let's just cut down our profit expected on this product because we are actually branding our company here. We're selling more than just the product. We're trying to get mind-share about uh Real Reaction to to the people who are gonna buy consumer electronics. We want people to eventually say, oh that's that's Real Reaction that's a good m make. It's relia

ble. And and we're gonna make it we're gonna win mind-share by uh either being a fantastic product or for it working, it just being good, reasonable-priced, and solid. So if we can make if we can put an emphasis here on it not breaking I think that's in itself an extremely big thing. We only have a few minutes left. Is twenty-five Euros a mid-market price for a remote? Okay. Okay. Well I'd be inclined to say, if we can make the design better than any comparable remote while reducing the cost, then that's the way we really should play it. If we can take it down to you know fifteen rather than twenty-five and make a low profit-margin on it, but we're really doing that to sell the brand. Yep we have five minutes left. Uh rather th uh to to to sell for Real Reactions. And I can communicate this to to the more senior uh mm people within the company here to to get a reaction. Well how does everybody feel? I I think The other the o the problem with that in my mind I just think off-hand as a as a consumer, would I wanna buy that? And I think maybe not because I've got a remote and I'll take it to different chairs, I'll take it to

different I w I don't wanna go over somewhere and put it down. It i if it is gonna be somewhere that you put it down then it needs to be at the side of your armchair, and that implies that there's only one T\_V\_ user. So it's very good for some people but it's not a like But it takes away the ease of use of the remote to a certain extent. You have to I sort of remember. You have to d shift down the side of the couch to find it and put it back and Yeah. I d I d I d I think it it in my mind it doesn't seem like something that oh I'd really want uh because of that fact. But I I don't know, that's just my opinion. Mm. 'Kay. So what do we think maybe we should Pedro, do you have any opinion on it? Really need to wrap up now. Yeah. Mm. Yeah. I mean there's al there's also remote controls I remember that that worked uh, this hasn't been done in a while I think, but th as a as a watch. Yeah, there is remote control watches um, but I think they're a sorta eighties thing, so it might not be easy to market in it uh but the the technologies came along and it might be cheaper to make now. Those things may have been inexpensive for all I know. Gotta cut up. Mm. The last remote you'll ever buy. Well if if we're going down that then we can we don't need to go the it it strikes me that the locator feature might actually be uh quite expensive to make. Whereas actually just putting it in a power cradle might not be too expensive at all because that's just done with mobile phones you can just n we we have said we have actually similar products that we can take from and potentially cut costs there. Um need to look into whether we can do that but uh I think we we have some m mobile phone-based products uh checking quickly our Internet. We really need to finish up here. But uh Yeah we have the the power-adaptor products. We sell power-adaptor products. So for example there's nothing stopping us using that technology. Yeah. Yeah I think so, without it being too In fact we can cut costs through using the manufacturing that's already gonna be in place here. Okay. Yep. 'Kay. Thanks guys.

---

# Meeting ID: 68

Data Source: Train

## Executive Summary

So in last meeting we have discussed the conceptual design and we asked you to prepare a prototype for the for the remote control . So let's see the what did you prepare . S so so I discussed with Guillaume . and we we are both agreed on some two versions of the prototypes , because we were no not decided whether we wanted to have an L\_C\_D\_ or not because it's too expensive . One with and one without L\_C\_D\_s . Um but both comes with a charger and then detachable and uh or control module . And detachable big buttons for all people um . Here we have the first one with the beautiful uh L\_C\_D\_ um display . S okay so I'll show you the the two prototypes . And you can uh just um browse into the the navigation menu by uh joystick joystick-like uh button . You can uh choose the direction You have on the mm on the side here the microphone for the for the speech recognition system here . And here the the switch that control if you want The the microphone picks up the speeches from anywhere . Is it an only a single mic or a microphone array ? Well so it's a microphone array . Oh it's very costly , microphone array . it's just a single microphone , I I think uh we we put it here because I think when you when you are browsing your L\_C\_D\_ you will be close to well it's better to to to place it here th than here , for instance . And here is a little switch that control if you want the the speaker uh recognition system to um to be on or off . And uh so this remote control comes up with its charger . How much does it cost this one ? Well this this prototype is um made for about uh well fi fi fifteen fifteen dollars Ah it's above it's above the budget . but uh it's just a prototype the and the the production costs we we can achieve uh about ten dollars . How many b battery is there ? Is it n the two A\_A\_s batteries in it . A\_A\_ rechargeable batteries . Is that two or one ? Actually uh it's a flexible thing . So and if you want to charge the battery you just put the remote control like that to plug in the the charger and uh leave it uh alone , it's alright . I forgot to tell you there is only a single button there , This button is like the mouse is like a joystick , you can move in three hundred and sixty degrees of direction and it the additi functions associated to all the actions you ma you have a click you have a double click all in a single button . You can move up , down , left , right , or you can do a swing . Here I present another version without the L\_C\_D\_ . So we have the the second version also with the different uh button configuration . The second version is also simpler , we d uh we had just uh I have to put the microphone also . Uh-huh and also the switch . Basically it's the same uh things uh uh as uh I presented before . But here we have uh we have uh four buttons for navigation . Press one button uh acting as a a enter button . So um yeah according to what

you said it's more robust to the user . And uh it's also cheaper to produce . We can produce uh such remote control for about uh four dollars . And I think you forgot a point here to have an button to find the charger , and if you disable speech recognition system then ? W w I'll I'll come to that point later on . in either versions you they they ha they use the same charger yeah . It's that same charger that you can use for the hand-phone but uh again depends on the types . I think we have to investigate more on that , but The price should be below twelve and a half Euro . but as the Marketing Manager says , people is willing to people are willing to pay more for good design . but the company is not willing to invest more at the moment . The price of selling is twenty five Euros . the the the thing that makes this the controller cheap is that it is modular If you want less function i i if you want a reasonable price you pay for the functions that you add on to the system , Something like customised . Yeah for example the L\_C\_D\_ , you can take it you can put it put it back in , or you can use the other one , or the speech recogniser with the microphone yeah yeah . You want a microphone to put in the speech recogniser you don't wan you pay less for the system you see . It's pretty flexible in the yeah price . You also have the the the two other modules for the parental control that that you ca you can add up to the to your remote control i i if you uh if you want to to have more more power on what you do , and uh which channel you want to choose and so on . H here is just the the the module for the kids and th if the parents want to watch T\_V\_ , up they come up with their modules , We also have this module for uh old people with big buttons , clearly labelled , and it acts like the previous one , you just plug in and it works . the i the idea the the conceptual idea is that simplicity and powerful . Simplicity meaning that we have few buttons , powerful is that all the controls with the one you saw we saw earlier in the meetings with lots of buttons n that's our uh an innovation um uh i in this uh design here . Okay now we come to other important features that I did not tell you . The first one is the speech recogniser , again it's detachable or add-on . And then we also have security feature it's very robust , and the material , what's the material again ? The titanium Again uh and the battery life is uh is an is an endureable one , again because this is A\_A\_ batteries you can choose the types of battery you want . Lithium-ion may be a good one , again you pay for what you get , and then um y the other p points are robust and misplacement reminder . So when you finish watching your T\_V\_ and you the you t you turn off the T\_V\_ , uh and then there's this message coming out that uh please put that back to the charger , And it also use a programmable channel and vocabulary , so we didn't define the vocabulary so it's up to the user to define And then uh because of the chil because children are using the device so we have also a a of T\_V\_ programmes by genre , and this can be used by the adult or by the children . What's the price to p to produce ? Well so the price to produce For uh the simplest one , say we start from four dollars to produce such a device . The without without the charger it's about uh well two dollars to produce uh the microphone and speech recognition systems . Two dollars for the uh for the add-on modules , and finally three dollars for the charger . So if you uh sum up uh everything wi with the L\_C\_D\_ , which costs two dollar , you have two plus four plus four plus two plus two . We don't have all the options . so the total cost if you if you want all the fuct functionalities will be about uh fifteen dollars . so you want more function you pay more . it's below the the the budget . I think we will just have a rough look and then we can make our statements , and we can finalise the product based on this discu So the marketing made an evaluation criteria and these were some of the findings , and uh in the market the people are not really interested with L\_C\_D\_ , without L\_C\_D\_ , with speech recognition interface , or without speech recognition

interface , but most of the people what they are interested is first thing is , they want to have an fancy look and feel , it should be very fancy with colourful and uh very handy to hold . And the second thing is it should be much more technologically innovative . Of course in that we could put L\_C\_D\_ or recognition to be more technologically innovative . And the third one is easy to use . since we haven't yet a remote who are allowing to to choose interactively with the T\_V\_ screen uh uh with just four buttons . Well I think that the technical in innovation is in the product itself here you can find these are the latest fashion updates , and so this in Paris and Milan they have detected this trends that the this year it's going to be an year of fruit and vegetable , so people are really interested to see if they have an remote in the shape of the fruit or a vegetable , or whatever they like . So I think it should be much more customised to make a different uh shapes . And the second thing is , and if the material , they really do not want it to be very hard , as in the case of very pl plastic or titanium , it should be somewhat spongy . you should find a material that is robust at the same time spongy . Yeah so uh so finally we have these three criterias . One is fancy look , second is innovative , and third is easy to use . So and we have an evaluation criteria for each one of these , say that we have a seven point scale , from one to seven , and for each of the product you could just give me the scale according to this . so on this scale , if it is true , if it is if it has a fancy look you could just tell me one , So now you have with L\_C\_D\_ and without L\_C\_D\_ , or if it is false , it doesn't it looks uh it doesn't look much fancy , then you could just tell me seven . But who will give the scoring uh we ourself or or a third party ? according to you designers , On on this scale the L\_C\_D\_ remote control . How do you look how does it look ? D is it very fancy or doesn't look much fancy ? I'll I'll say three or four . I think we can improve on the design . Som someone um commented this is like a the stone age uh design . Um we have been focused all all this time on the on the technical aspect , functional aspect , but also the simplicity . So I take three on with L\_C\_D\_ ? So without L\_C\_D\_ how would you rate it ? Uh four . I think it's it's uh more easy to make f fancy things when it's not complicated so removing the L\_C\_D\_ um gives us a li more liberty to to have a fancy look . And in the sense of innovativeness , with L\_C\_D\_ . Well it's it's the same for both so I will give a five , six . from the innovation aspect I feel that uh what is most innovative of our prototype compared to the existing prototypes that we saw I in the last meeting is that um the retrieval of T\_V\_ programmes by content , and for now and another innovation we have is simplicity and simplicity , few buttons , we've uh A lot of functionalities . So without L\_C\_D\_ ? Mm for both it's the the same innovations . So maybe I can put six to seven . actually uh to make it with L\_C\_D\_ you make more efforts . then when it is without L\_C\_D\_ there is not much innovativeness . Uh uh uh there w there was a there was a issue here is that what are what is the display on the L\_C\_D\_ ? but you have the same programme on the T\_V\_ screen . We haven't really uh determined what are actually actually I mean on the L\_C\_D\_ , according to what I understand from your model is , you have a joystick here , and you have L\_C\_D\_ , you just press your joystick , you get here a programme . on the T\_V\_ you don't it doesn't display on the T\_V\_ now . If you have the L\_C\_D\_ , Then uh there is no meaning in having it on the T\_V\_ . But you cannot display all on a L\_C\_D\_ . Anyway for for the users who who who opt for L\_C\_D\_ we'll give them the give them the L\_C\_D\_ , So without L\_C\_D\_ you want to put it fi the same level of innovativeness ? Well I think both are really easy to use and uh well t p the menu are clear , well-organised , so so I will give a six for the easy to use . No it's just if I I see the the f the rate I think it's better to do it without L\_C\_D\_ . Because that's with L\_C\_D\_ just will increase the price , So I mean in the product design you

could just amend it to make some few changes according to fruit and vegetable or a spongy touch without L\_C\_D\_ and without speech recognition . I have another thing to say about the easy to use aspect . I think the easy to use uh aspect is different for different people . For the young generation easy to use may be very complicated because uh they w they wants lot of controls with lots of buttons . For kids they want simply the s similarit for the old people they want simplicity , but but uh what I'm trying to say here is that the um we have different sets of buttons for different kinds of people . So without L\_C\_D\_ I just take it five ? Um six . and it's going to be much simpler to use . so let's go back to our laboratory and To improve on the design . what about the integration of speech recognition ? The speech recogniser is a add-on module . That's going to be an optional . S s oh I think it's better to have this without L\_C\_D\_ . As our Programme Manager s Pro Project Manager says that without L\_C\_D\_ it is going to reduce the cost also , I think it will be better if we have all these modules in the same remote control , because maybe parents will lose these uh but I mean if you have an add-ons , the kids may just uh hide the parental module Or maybe parents they can for forget where they put it or , The problem is if i we are bla if a customer wants a certain component , and doesn't want the parental control because it's a couple who do not have children when you sell the product in the market you could meet any kind of people , and not all people will need all the functionalities we propose to them . So you mean that even if these modules will be will be functional uh will be optional . But the the question is n does those modularity increase the production cost or decrease the production cost ? I think it inc increase . because it's three different pieces uh to to build but it's I think it's cheaper if you if you already built the all the functionalities um on the same module , but uh Well well the other aspect is that if in the when they have the ar existing product you you gonna maintain the the you're gonna keep the same customer , because the same customer will come back to buy other add-ons . i i so if don't buy now they can buy i in the future . attracting them to come back in again and again . Yeah well if the buyers can be up the th would be can be upgraded , it would be a good thing right ? And uh what's the idea about uh the shape of the remote controls ? Uh can they be made into a fruit and vegetable types ? but we are also the um well the components will have to change because uh we have to deal with the shape Or uh it could be like this the P\_C\_B\_ would be the same for all , but only the exterior uh shape is different o for all . What we can change is to propose the customers with skins . For example the i the mobile phones nowadays , they sell different kinds of skin and then people just feel that oh I have a new skin and looks better . we can have the same global shape and then uh add on skins and with with this uh tex spongy texture uh things like that . I think you need to look into the material . I think the Project Manager would be interested to look about the financial issues in making these models . Project evaluation project satisfaction , for example . I don't know , we have to ask these question . Room for creativity . This room is a bit small , but but I think it's okay for us to work with . This is fine for making a presentat for project presentations . And the leadership was excellent . Yeah I think so . Uh the teamwork was very very good . And new ideas found . Come up with new product . Yeah and also more well uh more seriously I think it's it's a good idea to have uh clear clear points whenever we do a meeting uh prior to the meeting to have uh well a list with the points who will be discussed or things like that , We achieved uh project goal I think . that is within the budget . yes , more or less . Without without L\_C\_D\_ , without speech recognition , it will be simple . Yeah thank you for your work and

## Complete Meeting Transcript

Mm. Yeah. So okay so I'll show you the the two prototypes. Here we have the first one with the beautiful uh L\_C\_D\_ um display. You you can s here. And you can uh just um browse into the the navigation menu by uh joystick joystick-like uh button. You can uh choose the direction and if you just push on it it's considered like a enter function. You have on the mm on the side here the microphone for the for the speech recognition system here. And here the the switch that control if you want Well I I think uh it's the Yeah but Yeah. Well so it's a microphone array. No it's just a single microphone, and you I I think uh we we put it here because I think when you when you are browsing your L\_C\_D\_ you will be close to well it's better to to place it here th than here, for instance. And here is a little switch that control if you want the the speaker uh recognition system to um to be on or off. And uh so this remote control comes up with its charger. Well this this prototype is um made for about uh well fi fi fifteen fifteen dollars fifteen dollars, but uh well it's not it's not uh yeah, but uh it's just a prototype and if we uh if we optimises the um the uh voila. Yeah the and the the production costs we we can achieve uh about ten dollars. How many, excuse me? Well uh f battery, we use uh about uh Yeah. Rechargeable of course, because we have the charger. Yeah and you just On uh yeah one battery. The excuse me? Oh yeah it's just a r uh simple battery a rechargeable uh if you uh like it's exist. Yeah. So and if you want to charge the battery you just put the remote control like that to plug in the the charger and uh leave it uh alone, it's alright. Then the next time you pick it, oh it works. Yeah just explain the button uh Norman. Yep. Yeah it's So we have the the second version also with the different uh button configuration. The second version is also simpler, we d uh we had just uh I have to put the microphone also. So basically th it's the same uh yeah. Basically it's the same uh things uh uh as uh I presented before. But here we have uh we have uh four buttons for navigation. Press one button uh acting as a a enter button. So um yeah according to what you said it's more robust to the user. And uh it's also cheaper to produce. We can produce uh such remote control for about uh four dollars. Yeah it's it's it's embed in the uh speech recognition system. So so Norman will explain to you. Yeah yeah of course mm. Thank thank you. And so mm-hmm. Alright please uh go on Norman with the special features. You also have the the the two other modules for the parental control that that you ca you can add up to the to your remote control i i if you uh if you want to to have more more power on what you do, and uh which channel you want to choose and so on. H here is just the the the module for the kids and th if the parents want to watch T\_V\_, up they come up with their modules, they just plug in it and they can have all the control they want here. We also have this module for uh old people with big buttons, clearly labelled, and it acts like the previous one, you just plug in and it works. The titanium and so it's very uh Well so the price to produce For uh the simplest one, say we start from four dollars to produce such a device. Uh it's about it The without without the charger it's about uh well two dollars to produce uh the microphone and speech recognition systems. Two dollars for the uh for the add-on modules, and finally three dollars for the charger. So if you uh sum up uh everything wi with the L\_C\_D\_, which costs two dollar, you have two plus four plus four plus two plus two. It's about so the total cost if you if you want all the fuct functionalities will be about uh fifteen dollars. But it's just if you want all functionalities. Excuse me? Yeah. Well I think that the technical in innovation is is in the product itself since we haven't yet a remote who are allowing to to choose interactively with the T\_V\_ screen uh uh with just

four buttons. Okay. A sponge. Hmm. Yeah. Well it doesn't look much fancy I'll I'll say three or four. Yeah. It's it's Technical aspects. Yeah a three. Uh four. I think it's it's uh more easy to make f fancy things when it's not complicated so removing the L\_C\_D\_ um gives us a li more liberty to to have a fancy look. Well it's it's the same for both so I will give a five, six. Well five also uh Norman please. With lot of functionalities. Mm for both it's the the same innovations. six, let's go for six. Yeah. Talk about Yeah but you have the same programme on the T\_V\_ screen. If you have the L\_C\_D\_, but if n Yeah. Yeah. Well I think both are really easy to use because there are few button buttons, and uh well t p the menu are clear, well-organised, so Well with little knowing of the technology you can you can easily use the product so I will give a six for the easy to use. Yeah, it's cheaper to produce. And uh if the the well if we have less technology we have more liberty to uh for the shape and uh things like that so Yep. Yeah. Six. Um six. Yes as you say, with better uh yeah. And to improve the the look. Yes and to give us more liberty to have a fancy look so so let's go back to our laboratory and Yeah. It's optional yeah, since well according to this study uh people more likes more to have a spongy uh remote control than Yeah. Well it's about the same because if Well you can if you had uh something li Oh no, because if you if you add uh something well yeah maybe because it's three different pieces uh to to to build but Yeah yeah yeah it's I think it's cheaper if you if you already built the all the functionalities um on the same module, but uh Yeah. Yeah. Well so Yeah yeah I think we are yeah but we are also the um well the components will have to change because uh we have to deal with the shape and um but I don't think it will uh increase the cost too much so Uh well but it's a bit complicated to if if you need machines to different machines to um ah well Yeah yeah we can have the same global shape and then uh add on skins and with with this uh tex spongy texture uh things like that. Sponge. Okay. So we finished the prototype uh presentation if you have uh something else to say. That was good. Yeah. Fine yes uh. Very democratic. Thank you. Alright. Come up with new product. Yeah and also more well uh more seriously I think it's it's a good idea to have uh clear clear points whenever we do a meeting uh prior to the meeting to have uh well a list with the points who will be discussed or things like that, but I think it's alright. We achieved uh project goal I think. It's w yes, more or less. Yeah but Alright. So. So uh coffee machine. Okay. Is it an only a single mic or a microphone array? Mm-hmm. Yeah. Okay. The cost would be le reduced. Is that two or one? Now what is the whole day rating for that? Whole day's rating. What type of battery? Something like a two A\_, A\_ three size batteries? Mm-hmm. And the L\_C\_D\_ is this one, on the remote? Yeah. Uh-huh and also the switch. Okay. Mm-hmm. And I think you forgot a point here to have an button to find the charger, because that's a major that's a Okay and if you disable speech recognition system then? Mm hmm hmm hmm hmm hmm. Okay. Yeah people are willing to pay more, but the company is not willing to invest more at the moment. Or uh Something like customised. Yeah. Mm hmm hmm hmm. Hmm okay. And this is other one? Mm hmm hmm hmm. Mm-hmm. Yeah that's fine. Okay. Mm hmm hmm hmm. With the charger? I think we can use Excel. Yeah it's a nice input but we have an other inputs from the I public demands. I think we will just have a rough look and then we can make our statements, and we can finalise the product based on this discu I think we can just go to my presentation then. We can wind up. Or we could uh come to some f uh final conclusions. So the marketing made an evaluation criteria and these were some of the findings, and uh in the market the people are not really interested wi

th L\_C\_D\_, without L\_C\_D\_, with speech recognition interface, or without speech recognition interface, but most of the people what they are interested is first thing is, they want to have an fancy look and feel, it should be very fancy with colourful and uh very handy to hold. And the second thing is it should be much more technologically innovative. Of course in that we could put L\_C\_D\_ or recognition to be more

technologically innovative. And the third one is easy to use. Okay and if we go to the next slide, here you can find these are the latest fashion updates, and so this in Paris and Milan they have detected this trends that the this year it's going to be an year of fruit and vegetable, so people are really interested to see if they have an remote in the shape of the fruit or a vegetable, or whatever they like. So I think it should be much more customised to make a different uh shapes. And the second thing is, and if the material, they really do not want it to be very hard, as in the case of very pl plastic or titanium, it should be somewhat spongy. Um. Yeah so uh so finally we have these three criterias. One is fancy look, second is innovative, and third is easy to use. So these are the f uh three criteria on which we are going to build our remote. So and we have an evaluation criteria for each one of these, say that we have a seven point scale, from one to seven, and for each of the product you could just give me the scale according to this. So now you have with L\_C\_D\_ and without L\_C\_D\_, so on this scale, if it is true, if it is if it has a fancy look you could just tell me one, or if it is false, it doesn't it looks uh it doesn't look much fancy, then you could just tell me seven. So We can make our study on this and No no we have you have designed two products now, one is with L\_C\_D\_ and without L\_C\_D\_. According to you, no according to you designers, how will feel does it uh with L\_C\_D\_ and without L\_C\_D\_? Okay let us make this L\_ and without L\_C\_D\_. On on this scale the L\_C\_D\_ remote control. How do you look how does it look? D is it very fancy or doesn't look much fancy? And you both agree for that? So I take three on with L\_C\_D\_? So without L\_C\_D\_ how would you rate it? Four. And in the sense of innovativeness, with L\_C\_D\_. Five with L\_C\_D\_ and So without L\_C\_D\_? No no according to design aspect we want to know how would you feel the innovativeness? With L\_C\_D\_. And without L\_C\_D\_? Okay. No actually uh to make it with L\_C\_D\_ you make more efforts. So I there is high innovativeness included if you make it with L\_C\_D\_ y then when it is without L\_C\_D\_ there is not much innovativeness. So we can't go I mean that what you are sayin that's what the design No it's like this, I mean on the L\_C\_D\_, according to what I understand from your model is, you have a joystick here, and you have L\_C\_D\_, you just press your joystick, you get here a programme. Uh then No on the T\_V\_ you don't it doesn't display on the T\_V\_ now. L\_C\_D\_? Then uh there is no meaning in having it on the T\_V\_. Or then again you have a channels, volume and all the stuff and what a I mean that depends upon your design, so I mean So without L\_C\_D\_ you want to put it fi the same level of innovativeness? And which do you recommend e easy to use, with L\_C\_D\_ or without L\_C\_D\_? Yeah. Or we can just go back to the previous slide uh where we ha we have a few updates. So I mean in the product design you could just amend it to make some few changes according to fruit and vegetable or a spongy touch without L\_C\_D\_ and without speech recognition. Even then our product is going to be very good. Yeah. Yeah that's right. Yeah yeah that's right. So without L\_C\_D\_ I just take it five? Or you want it to be six? S s oh I think it's better to have this without L\_C\_D\_. As our Programme Manager s Pro Project Manager says that without L\_C\_D\_ it is going to reduce the cost also, and it's going to be much simpler to use. So. That's going to be an optional. If somebody wants to b

uy it they can have it, otherwise no. It's an optional. Yeah. Yeah, but I mean if you have an add-ons, the kids may just uh hide the parental module and so that their parents can't use it. In the same set, yeah, and and individual buttons to make them work. I mean how to how to how to make a marketing survey that uh how many married couple or how many couples have a T\_V\_ or to the number or singles who have a television. So based on that I think But you can make it on a single P\_C\_ with three different options. On the same P\_C\_B\_ yeah yeah. Yeah that's right. I mean you could just provide with an optional. So it's something like a Microsoft product update. Updates and we sell it. We make updates and sell it. And uh what's the idea about uh the shape of the remote controls? Uh can they be made into

a fruit and vegetable types? Do you require different types of P\_C\_B\_s and Or uh it could be like this the P\_C\_B\_ would be the same for all, but only the exterior uh shape is different o for all. Yeah, yeah that's right. Yeah that's right. I think you need to look into the material. Yeah yeah. I think the Project Manager would be interested to look about the financial issues in making these models. I feel it's fine, we know we don't need uh I think it's okay. This is fine for making a presentat for project presentations. And the leadership was excellent. Yeah that's right. Yeah that's right. And new ideas found. Any new ideas to make these presentations more interactive and more interesting? I mean uh what type of product would you think could we make this more interesting? Yeah that is within the budget. And the evaluation was Yeah that's right. And the next is celebration. So Yeah thank you, thank you very much. So in last meeting we have discussed the conceptual design and we asked you to prepare a prototype for the for the remote control. So. So let's see the what did you prepare. Sh share folder for th your presentation? Because I have here Okay just one. Why you why you you put it in the the side? It's not a good place maybe. Oh it's very costly, microphone array. How much does it cost this one? Fifteen dollars? Ah it's above it's above the budget. How many b battery is there? Battery. So one one battery? It's kinetic reserve. Mm. I think it's not a good idea because after maybe one or two months of function is getting destroyed. If you Mm-hmm. No four dollars, it's good. And we will we will serve the charger with this? With the remote control. Okay so the price of the charger included in the Mm-hmm. The price should be below twelve and a half Euro. Well that's so We have we have just The price of selling is twenty five Euros. And the price of production That's for this basis function and if you want more you pay more. Yeah. Okay. But Mm-hmm. Titanium. What what's Maybe yeah. What's the price to p to produce? With with with the charge? Okay. We don't have charger. We don't have all the options. Charger we don't have charger here either. No it's it's below the the the budget. It's below the bu the budget. We Yeah. You. And you? Mm-hmm. Uh For L\_C\_D\_. Without L\_C\_D\_. Uh no innovative yeah. So let's remove it. But This is the problem. No it's just if I I see the the f the rate I think it's better to do it without L\_C\_D\_. Because that's with L\_C\_D\_ just will increase the price, and I thi i they have the same rate so without L\_C\_D\_ it will be Mm-hmm. Mm-hmm. Without L\_C\_D\_. Yeah. What a what what about the sys speech recognition? what about the integration of speech recognition? Ah so it's optional with the okay. I think it will be I think i I think it will be better if we have all these modules in the same remote control, because maybe parents will lose these uh Yeah. Or ma yeah. Or maybe parents they can for forget where they put it or, so mayb better if you have all this in the same Yeah. So you mean that even if these modules will be will be functional uh will be optional. Uh I think it inc increase. I think it i increases. Hmm.

And and we we we we we we don't want that. So Project evaluation project satisfaction, for example. I don't know, we have to ask these question. We have to give answers so Project evaluation. Mm-hmm. Yeah I think so. He gave you the liberty to talk as you wants. Uh the teamwork was very very good. I was really I am very satisfying to work with with you. Oh. Less fancy. De Without without L\_C\_D\_, without speech recognition, it will be simple. Yeah free free coffee. Yeah thank you for your work and Okay. Yeah, so can you go out to the shared folder? Mm the shared folder. Yes. We have a presentation. Uh So I got the participant uh three. W uh. Three. It's the final design, yeah. S so so I discussed with Guillaume. Right. And uh so we have and we we are both agreed on some two versions of the prototypes, because we were no not decided whether we wanted to have an L\_C\_D\_ or not because it's too expensive. So we come up with two versions. One with and one without L\_C\_D\_s. Um but both comes with a charger and then detachable and uh or control module. And detachable big buttons for all people um. So. Mm. Mm. Mm-hmm. No i i it's the all around camer uh microphone isn't it.

The the microphone picks up the speeches from anywhere. Yeah Mm. Yeah yeah. For the Yeah. Mm. Hmm. Is it n the two A\_A\_s batteries in it. A\_A\_ rechargeable batteries. Yeah rechargeable batteries. We have the charger so it's no problem. Actually uh it's a flexible thing. You just n uh Yeah yeah. Yeah. Yeah. Yeah. Mm. At uh yeah. I forgot to tell you there is only a single button there, b this button yeah alright. This button is like the mouse is like a joystick, you can move in three hundred and sixty degrees of direction so you can make a turn and it the additi functions associated to all the actions you ma you have a click you have a double click all in a single button. You can move up, down, left, right, or you can do a swing. So a swing to the left, a swing to the right defines other functions. So even though it's a single button, but it is pretty s flexible because of the three hundred and sixty degree movement. Yeah. This is the version y that comes with L\_C\_D\_. Here I present another version without the L\_C\_D\_. Mm. Uh okay this is new prototype uh. Yeah yeah. Mm. Oh no th actually th we'll come to that point in our Yeah. W w I'll I'll come to that point later on. Yeah. Th they either these with the uh the the charger any in either versions you they they ha they use the same charger yeah. Uh it's a standard module so you should get it for a cheap price uh. It's that same charger that you can use for the hand-phone but uh again depends on the types. I think we have to investigate more on that, but Yeah. Yeah but as the Marketing Manager says, people is willing to people are willing to pay more for good design. Yeah. Yeah. Mm-hmm. Yeah we'll we'll come up to that, the the the thing that makes this the controller cheap is that it is modular so you want more function you pay more. If you want less function i i if you want a reasonable price you pay for the functions that you add on to the system, so is uh modular. Yeah yeah, for example the L\_C\_D\_, you can take it you can put it put it back in, or you can use the other one, or the speech recogniser with the microphone yeah yeah. You want a microphone to put in the speech recogniser you don't wan you pay less for the system you see. So It's pretty flexible in the yeah price. Uh yeah yeah you should present that. Yeah. Yeah Mm. Hmm. Yeah. Yeah the i the idea the the conceptual idea is that simplicity and powerful. Simplicity meaning that we have few buttons, powerful is that all the controls with the one you saw we saw earlier in the meetings with lots of buttons n but here you only have few buttons but you retain the mm the same powerful functionalities. But in addition with simplicity. So that's the best idea, the cond that that's our uh an innovation um uh i in this uh design here. Okay now we come to other import

ant features that I did not tell you. The first one is the speech recogniser, again it's detachable or add-on. And then we also have security feature for example this here oop it's very robust, it doesn't break and the material, what's the material again? Titanium material. Again uh and the battery life is uh is an is an enduring one, again because this is A\_A\_ batteries you can choose the types of battery you want. Lithium-ion may be a good one, but you can replace it with cheaper one, again you pay for what you get, and then um y the other p points are robust and misplacement reminder. So when you finish watching your T\_V\_ and you the you t you turn off the T\_V\_, uh and then there's this message coming out that uh please put that back to the charger, so so that's the or is it that's the reminder part. Yeah and um And it also use a programmable channel and vocabulary, so we didn't define the vocabulary so it's up to the user to define so sorry? And then uh because of the chil because children are using the device so we have also a a of T\_V\_ programmes by genre, and this can be used by the adult or by the children. So instead of choosing the channel you are choosing the T\_V\_ contents of the night. So it's pretty powerful, and that's that's why the num buttons are reduced, because of this feature. Yeah. And and for the materials that is cheap to produce I think uh it's quite clear from yeah. And also like the and the fancy designs yeah. Maybe we can improve more on the design but uh this is the Yeah. Yeah. Yeah. Yeah. Yeah. Mm. Mm. Spongy spongy. Mm mm. Mm mm. But the the problem is that uh is it

robust to mishandling? We have you should find a material that is robust at the same time spongy. Spongy. Mm-hmm. Mm-hmm. Mm. Mm. So so is the evaluation depending on us or other users? Yeah. But who will give the scoring uh we ourselves or or a third party? Mm. Mm. Mm. I think we can improve on the design. Som someone um commented this is like a the stone age uh design. Um we have been focused all all this time on the on the technical aspect, functional aspect, but also the simplicity. As for the design maybe we should hire a designer to help. Yeah. Yeah. Yeah. Mm. Yeah from the innovation aspect I feel that uh what is most innovative of our prototype compared to the existing prototypes that we saw in the last meeting is that um the retrieval of T\_V\_ programmes by content, because uh that is really innovative, and for now and another innovation we have is simplicity and simplicity, few buttons, we've uh A lot of functionalities. So that is uh that is uh for both th Our gi I think that the our our product is uh has the best in all well this is a biased judgement because we designed them. Yeah. Uh the innovation is v is very high I think. Both. For both. It's the same innovation. So maybe I can put six to seven. Both. Mm. Uh uh uh there w there was a there was a issue here is that what are what is the display on the L\_C\_D\_? We haven't really uh determined what are actually actually it's good to have a L\_C\_D\_ but what are we gonna display on a L\_C\_D\_? Yeah? Yeah. Yeah but Yes exactly. But you cannot display all on a L\_C\_D\_. Anyway for for the users who who who opt for L\_C\_D\_ we'll give them the give them the L\_C\_D\_, we give what the customer uh wants, right. Yeah. Yeah. Yeah. Yeah I think sorry. Yeah. Yeah. Yeah. Yeah. Mm. S Yeah. I have another thing to say about the easy to use aspect. I think the easy to use uh aspect is different for different people. For the young generation easy to use may be very complicated because uh they w they wants lot of controls with lots of buttons. For kids they want simply the s similarit for the old people they want simplicity, so that's why we have the parental module. Uh we can ha have build a more complex design if if they want it, but but uh what I'm trying to say here is that the um we have different sets of buttons for different kinds of people. So in terms of easy to use I think it's very us

er customisable. User customisation is very important yeah. Yeah so W uh I think it's the same. Yeah. Yeah. Mm. Yeah. To improve on the design. Huh? The speech recogniser is a add-on module. Right? Yeah. Oh. The problem is if i we are bla if a customer wants a certain component, and doesn't want the parental control because it's a couple who do not have children when you sell the product in the market you could meet any kind of people, and not all people will need all the functionalities we propose to them. So we might lose the customer because of this. I don't know, what do you think uh? Yes exa what do you think, I don't know. You are Marketing Manag. Yeah. Yeah. But the the question is n does those modularity increase the production cost or decrease the production cost? Mm. Mm. Yeah. Well well the other aspect is that if in the when they have the ar existing product you you gonna maintain the the you're gonna keep the same customer, because the same customer will come back to buy other add-ons. So so Yeah i i so if don't don't buy now they can buy i in the future. So in in that way you're actually keeping the cus the same customer, attracting them to come back in again and again. We're not trying to follow the Microsoft and we don't want to the m Yeah well if the buyers can be up the th would be can be upgraded, it would be a good thing right? Yeah, it depends on the v production. Mm. Mm. Yeah. What we can change is to propose the customers with skins. For example the i the mobile phones nowadays, they sell different kinds of skin and then people just feel that oh I have a new skin and looks better. Yeah. Yeah. Yeah. Yeah you can pl in what material would that be in uh? Yeah or furry like a pet dog kind of thing. I suppose that you this criteria, is it? Room for creativity. This room is a bit small, but but I think it's okay for us to work with. Yeah mm. Mm. Yeah anyway we have the laboratory nearby to build our modules so it's okay. Good job good job. Thank you. Alright. Mm. Mm we

I I know something, we need more cakes, more biscuits on the table while we have meetings. Mm. Mm.  
Alright then, we finished? Thank you very much.

# Meeting ID: 90

Data Source: Train

## Executive Summary

I hope you're ready for this uh functional design meeting . I will take the minutes we need uh to know the the user uh needs we want to know how it going to work third part uh I don't remember let's go for the three presentations , so first um Marketing Expert . So as you know , you I think you already know me , Sammy Benjo . I am the expert in marketing and I want to tell you about what people uh s want and uh like and dislike in remote controls , what I suggest is that uh instead of deciding ourself what what could be and what should be a good uh remote control , let's ask people who are users of remote controls what they like , what they don't like So we've we've conducted a a survey on on the use of uh remote controls what we found was that uh there are several things that the user don't like in remote controls . First of all , they find it very ugly . uh they're not nice colour , not nice shape , I mean they're all the same , Um what is interesting is that in fact it seems that they were people are ready to pay for nice and look and fancy looking uh remote control , so I think we should probably spend lots of time in and effort in that um . and it it the the current uh facilities that they offer do not match what people really want to use their remote controls . And the other thing is that uh the the current remote controls are not so easy to use For instance uh we see that uh they zap very often so I think this is a very uh important uh functionality And most of the buttons uh on uh current remote controls are not used , so I think we should design something where some of the buttons which are those that are used should be easier to see and use than others that only a couple of people are using . people are very frustrated w with their remote controls and they for instance uh they don't even find it it's it's often lost somewhere in the in the in your home Maybe if we have something where we could ask the remote control please , where are you ? Like uh something to to like t I think phones . Some of the phones have some of this kind of s functionality . And because of the fact that there are so many buttons in these remote controls that nobody use , so most of the the people say they they don't know how to they to use properly their r remote controls . And uh they are bad for R\_S\_I\_ but uh I don't remember what is R\_S\_I\_ . Yeah , it's electromagnetic waves or something kind of maybe uh effect . but we have to take this into account . now I remember what is R\_S\_I\_ it's repetitivity stress injury . So we've listed a couple of uh Functions . that may be uh used by u the user in the current uh available uh remote controls but what is important is to understand that the power button is not used often because in general you use it only once per session , but it is very relevant . People want to have a power button . Channel selection is uh o often used very often used Volume is

not often used but people uh want to have control on volume And All of them . they're not often used and they are s more or less relevant . It seems that people find teletext teletext uh relevant , but seems that it's average relevant at least , so . I have been told that we uh don't consider teletext , that it's out of date now because of internet . if if there are good reason not to put teletext it's okay One of the thing the trend uh that uh you are probably aware of is the possibility the eventual possibility of having speech recognition in your remote control , so you wouldn't have to tap tap in your buttons but just tell your remote control or whatever you need you have what you want . So we've conducted a survey about uh whether people would like or not to have uh this kind of uh functionality in their remote control and as we can see it really depends on the age . Young people , probably because it's a buzz word , find it very relevant . And uh as the age goes up the the relevance goes down . So now it really depends on the kind of uh targeting uh wha who are we targeting with this remote control ? I think if we are targeting young people then uh it's probably something we have to consider . If we are targeting you very old people this is something they really don't know why they this should be so that's basically my findings . should we aim at the young people or not ? I think we should aim at the young people . But uh I think they are they are those uh who might be more interested in a in a new device . In general the the early adopters of a new device are young people , Then teletext is useless for them I think , Because they they have other means of finding their information . Yeah . my name is Mark Dwight , and um I am responsible for User Interface Design . However , uh mm Project Manager asked me to give you some presentation about technical functions design . that's gonna be less technical functions but more User Interface and current intentions and everything which is linked with this . And uh a general method which is seems to be very useful for our task We should never complicate things too much . We should only make a remote control , nothing more . Nothing more than this , just a remote control . 'Cause current remote controls they are never easy enough to use . So here is this remote control . It's quite a standard one , but it's not from a T\_V\_ , it's from a much easier device like air conditioning or something . But you know , we can use it for a T\_V\_ easily . Only buttons we need is on off , volume , channels and maybe some options or something else , I would say the simplest one as long as there are the uh I find the buttons that I need every time I need a button . Maybe it can be yeah middle of like , between those two compared to this one Our question of the style , we should remember that our company puts fashion into electronics For personal preferences I think that to make a baby-proof remote control it got to be a titanium . It is unbreakable and it is very universal . W we'll have a screen with a back light which can change colours , and we can put all the options into this screen . We'll need only few buttons . All the other things can be controlled through the screen . And all these buttons should be easy to find and to click , I would propose this concept for design , just few buttons , a screen with a back light which can change colours , titanium We need power and volume . And let us include two nice features into this device , first , power on and off can be made fully automatic . When you go to the sofa , take your control and point it to the T\_V\_ , the T\_V\_ turns on . And when does it turn off ? When you don't touch the control For for enough time And another nice feature that I would like to implement is uh volume control . Suppose you set u you set up some volume and then you move out or you move to the other corner of the room and take your control with you . Like , you want to to change the chair or you want to move to the armchair from the sofa or something , and then the volume changes . Uh I'm not sure about the screen , According to your distance to and the angle

maybe , if you have a stereo system . wha what is the use usefulness of the screen ? Uh is it a touch screen by the way ? I think it can be just a menu which can be controlled with a left , right , up , down and enter . but uh it has to be with an back light somehow . So basically that's it . Um I see that you target uh several s application not only T\_V\_ but i like we talk about um universal uh remote control . Can be easily done , Since we were targeting a really soon uh uh date for the the the um i issuing of this uh remote control I think we will only concentrate on T\_V\_ for the moment and then maybe m make it more generalised yeah . but it's quite universal you know . We can just extend it to any device . for instance if I want to go to directly to channel twenty five , how would I do can I do that with this ? You know these days we have hundreds of channels , In fact I would propose another solution . Basically you use just four or five channels , set up your T\_V\_ set like channels that you use they're one , two , three and five , and you will never have to go to a twenty fives channel . But even we can have some uh L\_C\_D\_ display , like you can uh de you can just button the number One thing is that as I said in my presentation people really do like to z zap . So even if they are only watching four or five channels , I think they want to zap out of the one hundred channels , on zap it's only next next next next next , yeah . But otherwise like we can put some display on numbers Mm . We got these buttons here . Next next . Maybe we can make uh different modes for each button and you can change mode zapping mode or uh if you want to go for a universal then we ought to limit for functions for each of our devices . but since we are focusing only on T\_V\_ remote controls so we can have more functions for T\_V\_ Could we carry out some research if we w really need this , like how many people really need to go to channel number twenty five and then to sixty four ? I'll check in my department if there's someone specialist in that . Uh as you know , I am mister Ramaro . I am an expert in uh industrial design of all electronic devices So now I'll briefly describe the working design of our remote control . as you know the basic function of remote control is sending some message to the the device , like T\_V\_ or V\_C\_R\_ or D\_V\_D\_ player etcetera . So we need to have some energy source to do what to do the functions , what we want on this portable device . so to do these functions we need an interface , which basically some kind of pressing buttons or keys or like moving jack or something like that . And then these messages these key buttons can be transferred into some kind of message and then it will process by the chip and then it will generate some information to the main device . uh since we are focusing on our interface device remote control mainly the energy source like the battery and then we have user interface like uh the keypad and you know buttons we want , we ought to have some kind of processor And then we'll have the infrared L\_E\_D\_ source Then we'll have switch in our main uh um device to do particular operations , and we ought to do different codes for different T\_V\_s , To make it quite uh an universal uh device uh . because the people don't use one particular brand so So we need to check their specifications So we need to have particular encryption codes . so I'll input the connections to all this components . so if you want to add some more components we can incorporate them . Mm-hmm . And from from the discussion we had do you can you make it on the whiteboard , or mm . and also Marketing Expert for the speech recognition is really handy , we can have another , like uh s simple speech recogniser on our D\_S\_B\_ chip . and we can have some speech recognition and in our g generally small digital signal processing chip so that and we will put uh the small uh simple speech recogniser you can find even simple mobile device like any mobile brand you can have these voice dialers or these things , yeah . Think of a all these young people who would love to say that this remote control only works for them ,

And what about the price of this component ? Uh maybe we can make uh it in five Euros and even less than that , The user uh will just be able to say uh please can you uh pump up the volume or it will be something like volume , up , down . And then we can have channel they can say , okay I want eight , we don't want like B\_B\_C\_ or C\_N\_N\_ or something else it will be complicated First of all I think this is not uh functionality that it is going to be instead of using the buttons . actually we we can have one switch to like uh switch on , on and off , this processor Did you consider the r gest uh gesture recognition ? Like , if I want to put volume up I like do mm I take my remote control do like something like roll 'em up or roll 'em down . Very expensive , what about the idea of automatic on off on the button , yeah . even automatic on off is also a bit problematic , like so suppose people are really uh they just uh they don't touch the remote and mm y you don't know how much time you need to switch on or switch off So in in a given room there might be more than one remote control . We would uh have each one and uh with our own personal uh settings . Yeah that can be possible , especially for power settings , so user can say okay , suppose they're watching a tennis match or something then they can say okay uh after one hour I we're now going to I have the lunch break . Then we will work again for thirty minutes individual work , and um we will uh meet again for the next meeting , and uh in this one want to to be more focused on the individual actions the um on the components you will focus on the component concept um uh of course the U\_I\_D\_ Mark will be uh focused on the user interface concept and uh our m Market Expert Sammy Benjo uh on the trend watching . of course like before specific instruction will be sent to you by your personal personal coach . And we have um maybe we have to we say , only for T\_V\_ , not teletext ? Uh I think automatic on off control uh it's not possible . But speech recogniser can be possible . Uh , should it be equipped with the uh , with uh speakers ? Like , you want to find it , you shout and it answers is I'm here ? Or But that's ex that's expensive . Uh . Just beeps ? I I heard of devices where you just uh whistle them because of the the frequency they they just answer to that . You can clap . Can you ? But it's a good feature I guess yeah we're done ? let's go to lunch . because we have only very few words like like power , switch on or some like so we try to only recognise those words and and because we can't really say user to say same wording

## Complete Meeting Transcript

So Of course. Nice stuff Who starts? Oh. Ha. okay. So I dunno if I can do that like this? Yeah? So it's being modified. Do you want yeah, open. Read only. I hope I saved it. So, um yeah, this is my name. So as you know, you I think you already know me, Sammy Benjo. I am the expert in marketing and I want to tell you about what people uh s want and uh like and dislike in remote controls, and I hope this is going to help you to to design it correctly. So next please. Uh-oh. Hmm. Yeah maybe in the full page because i I spent lots of time doing this presentation, so. Uh-huh hmm okay. So basically uh what I suggest is that uh instead of deciding ourself what what could be and what should be a good uh remote control, let's ask people who are users of remote controls how they feel about w the current remote controls, what they like, what they don't like and um and what they do with them by the way because they are supposed to be useful. Don't forget about that. So we've we've conducted a a survey on on the

use of uh remote controls and I'd like to show you some of the results we found on this survey. And next please. Yeah, so basically what we found was that uh there are several things that the user don't like in remote controls. First of all, they find it very ugly. Current remote controls as you know they're the same as this one uh they're not nice colour, not nice shape, I mean they're all the same, and they're not I good looking. Um what is interesting is that in fact it seems that they were people are ready to pay for nice and look and fancy looking uh remote control, so I think we should probably spend lots of time in and effort in that um. And the other thing is that uh the the current remote controls are not so easy to use and it it the the current uh facilities that they offer do not match what people really want to use their remote controls. For instance uh we see that uh they zap very often so I think this is a very uh important uh functionality that it should be easy for them to to zap uh in one way or another. And most of the buttons uh on uh current remote controls are not used, so I think we should design something where some of the buttons which are those that are used should be easier to see and use than others that only a couple of people are using. Um next please. Now people are very frustrated w with their remote controls and they for instance uh they don't even find it it's it's often lost somewhere in the in the in your home and nobody knows where it is. Maybe if we have something where we could ask the remote control please, where are you? Like uh something to to like t I think phones. Some of the phones have some of this kind of s functionality. Uh of course phone you can always phone your phone but you can't phone your your remote control. But why not? Yeah. And because of the fact that there are so many buttons in these remote controls that nobody use, in fact they don't even know how to use them, so most of the the people say they they don't know how to they to use properly their r remote controls. And uh they are bad for R\_S\_I\_ but uh I don't remember what is R\_S\_I\_. So I think they are bad. Mm-hmm. Mm nobody has any idea about that? Well I'll check uh with my Oh, okay, I think it's a technical thing which our Okay. So, it seems that it's a lot of people for a concept that we don't know but we have to take this into account. So anyway that's for what the biggest frustration uh of the user and um what else do I have? Next slide? Ah yeah. So we've listed a couple of uh s uh functions that may be uh used by u the user in the current uh available uh remote controls and uh well the tables look very nice to read but what is important is to understand that the power button is not used often because in general you use it only once per session, but it is very relevant. People want to have a power button. Channel selection is uh o often used very often used and indeed uh very relevant. Ah now I remember what is R\_S\_

I\_ it's repetitiveness stress injury. We have to be careful with that word but uh anyway I continue my presentation so yeah, channel selection is um very important, very often used. Volume is not often used but people uh want to have control on volume and that makes sense of course. And n then you have things which are very much less often used like the settings. Audio settings, screen settings, even teletext and channel settings. All of them. they're not often used and they are s more or less relevant. It seems that people find teletext teletext uh relevant, even if I personally never use it but seems that it's average relevant at least, so. I can tell you that uh in a l in a scale between one and ten relevant uh not relevant to relevant people scored a six on this, which is not as uh these these two one were had I think ten I think. But but if you compare with these ones, uh I think they scored a one or two. Not very relevant, so if if there are good reason not to put teletext it's okay but just know that people find it somehow relevant. That's for the main functions I think and uh then we can ask uh ourself uh what people don't have that may be useful. For instance I think net next slide. One of the thing the trend uh that uh you are probably aware of is the possibility the eventual possibility of having speech recognition in your remote control, so you wouldn't have to tap tap in your buttons but just tell your remote control or whatever you need you have what you want. So we've conducted a survey about uh whether people

would like or not to have uh this kind of uh functionality in their remote control and as we can see it really depends on the age. Young people, probably because it's a buzz word, find it very relevant. And uh as the age goes up the the relevance goes down. So now it really depends on the kind of uh targeting uh wha who are we targeting with this remote control? I think if we are targeting young people then uh it's probably something we have to consider. If we are targeting you very old people this is something they really don't know why they this should be so now this is of course, depends on that. And um I don't have any conclusion, I didn't have time the meeting was very tight, so that's basically my findings. And uh, if you have any question? I can go back. Yeah one question, yeah? I am. I think we should aim at the young people. But uh I think they are they are those uh who might be more interested in a in a new device. In general the the early adopters of a new device are young people, less than more than Then teletext is useless for them I think, yeah. Because they they have other means of finding their information. Yeah. But yeah. Nope. 'Kay? So I think it's you, huh? No? No, user requiremen Makes sense. I would say the simplest one as long as there are the uh I find the buttons that I need every time I need a button. Nice. Nice sentence. Mm. Mm-hmm. Hmm. And when does it turn off? Oh so you have a sensing sensor machine that uh knows Tech Mm-hmm. According to your distance to and the angle maybe, if you have a stereo system. Uh I'm not sure about the screen, wha what is the use usefulness of the screen? Uh is it a touch screen by the way? So it gives instructions but uh it has to be with an back light somehow. Okay. Okay. So for instance if I want to go to directly to channel twenty five, how would I do can I do that with this? Yeah mm let's say I am uh on channel eight now. You know these days we have hundreds of channels, that's not so easy to go just next next next when you have hundreds of channels. Or is it? Most people yeah. In fact in in one uh remote control that I've seen, instead of doing that d you could just say these are the cha ch channel three, twenty eight, forty eight and uh sixty four are those that I want to by cycled with my next button. I uh B yeah. Go to channel twenty five. One thing is that as I said in my presentation people really do like to z zap. So even if they are only

watching four or five channels, I think they want to zap out of the one hundred channels, just because this is one kind of thing they do, zapping. And it's only next. Yeah so but you have to Okay. So it would be Okay. Mm-hmm. Alright. Listening more. Mm-hmm. Okay. Well I could could uh have a look at that maybe. I'll check in my department if there's someone specialist in that. Although I don't know. Mm-hmm. Mm-hmm. But uh very very good to sell. Think of a all these young people who would love to say that this remote control only works for them, and ha ha you cannot use my remote control, because it's targeted to me. Whatever. Hmm. Cheap. Millions. Cheap. The user uh will just be able to say uh please can you uh pump up the vo pump up the volume or or it will be something like volume, up, down. Okay. Okay. Couple of words. Okay. Of course uh it has to be Okay. But then I think you you First of all I I think this is not uh functionality that it is going to be instead of using the buttons. It's on top of using the button. Well, I dunno. T\_V\_. Very expensive, no? And volume control. So but uh Sh should we target a a user personalised uh uh remote control? So in in a given room there might be more than one remote control. We would uh have each one and uh with our own personal uh settings. Hmm. Yeah, of course. That's no problem, we will sell more. Yeah exactly. Okay. Thanks. Mm great. Difficult. Mm-hmm. No. Speakers in the remote cont Oh yeah. It just beeps. That would be enough. Something very cheap. But that's ex that's expensive. Uh. Well I I heard of devices where you just uh whistle them and and they because of the the frequency they they just answer to that. You can't whistle. Uh-huh. Or a clap. You can clap. Can you? Clap is good. Tak Just a suggestion. With only one hand? These are not our target people. Mm-hmm. Oh that's e that already exists okay okay. Oh yeah, you do have.

Wow. You're trendy. Think about it. Yeah, okay. Okay. Good we're done? Right, thanks. Yeah, it is put F\_ five. The full page presentation, yep. Yeah. Yep. Yeah. Yeah. Yeah. Yeah. You can you are. Hmm. Yeah, it's electromagnetic waves or something kind of maybe uh effect. Yeah, because infrared uses some electromagnetic technology, and those waves have high Uh. Uh. Yeah it's People really Yeah. Yeah. Uh. Hmm. Yeah. 'Cause Thank you. Mm. Mm. Mm, yep. Thank you. Uh it's techni function of Yeah. I have to do working design so uh. Mm. It's Yeah, yeah. Yeah. Maybe it can be yeah middle of like, between those two li S you should yeah. Mm. Distance. Yeah. Mm-hmm. Mm. Mm. Yeah and it mm. Mm. Mm. Yeah. But even we can have some uh L\_C\_D\_ display, like you can uh de you can just button the number and then it go t because Yeah. But still Yeah. Yeah. Yeah. Yeah.. Yeah. But otherwise like we can put some display on numbers and then they can just press suppose two five they just press two and five and then Yeah. Yeah. Yeah, yeah. Yeah, yeah. Yeah but since we are focusing only on T\_V\_ remote controls so we can have more functions for T\_V\_ uh if you want to go for a universal then we ought to limit for functions for each of our devices. Yeah. Yeah. Two. Yeah, if Sorry. Yeah. Uh as you know, I am mister Ramaro. I am an expert in uh industrial design of all electronic devices and I previously devised many uh like digital calculators and electronic calculators. So now I'll briefly describe the working design of our remote control. Well, as you know the basic function of remote control is sending some message to the the device, like T\_V\_ or V\_C\_R\_ or D\_V\_D\_ player etcetera. So we will have a p portable device which will send message to the the main device like T\_V\_. So we need to have some energy source to do what to do the functions, what we want on this portable device. And usually this so to do these functions we need an interface, which basically some kind of pressing buttons or keys or like moving jack or something like that. And then these messages these key butto

ns can be transferred into some kind of message and then it will process by the chip and then it will generate some information to the main device. It's generally in the form of infrared or some kind of s sensor information. Then we will have the main control in the main device to do the particular action what we want. So, basically we need uh since we are focusing on our interface device remote control we need few components, mainly the energy source like the battery and then we have user interface like uh the keypad and you know buttons we want, and then we have some chip, it's mainly digital signal processing chip because since we are I am one doing mostly digital uh devices we ought to have some kind of processor which take care of all these functions and put it in some digital format. And then we'll have the infrared L\_E\_D\_ source which sends the information to the main device. Then we'll have switch in our main uh um device to do particular operations, and we ought to do different codes for different T\_V\_s, so some T\_V\_s will have different encryption codes for doing s s uh channel changing and these things. Yeah yeah, because the people don't use one particular brand so or at least we have more more than five brands, which are really good. So we need to check their specifications and do their uh encryption that's passing information to the T\_V\_ device. So we need to have particular encryption codes. Then, components, so we have the main uh energy source and then we will have some buttons and then we will have infrared uh source and then we have some inside some chip in in the device. Uh since I don't have much time so I'll input the connections to all this components. And since I also want to know feedback from our Marketing Expert and User Interface, so if you want to add some more components we can incorporate them. Yeah. Yeah, I'm sure, because since our User Interface speech recognition and also Marketing Expert for the speech recognition is really handy, so we can have another, like uh s simple speech recogniser on our D\_S\_B\_ chip. Since we have some kind of uh energy this is our this normal battery, so this battery, once you s switch on it will take power

and we can have some speech recognition and in our g generally small digital signal processing chip so that and we will put uh the small uh simple speech recogniser and we can also train the speech recogniser for particular user so you just yeah, so that we just use simple recog no but but Yeah. No, even in you can find even simple mobile device like any mobile brand you can have these voice dialers or these things, yeah. Yeah. Yeah. So Uh maybe we can make uh it in five Euros and even less than that, because we want to have uh millions and in bulk, so we can make really simp and we want to make really simple device because we have only very few words like like power, switch on or some like then we'll have something like this um we'll have volume and then we will have s particular channel, so users can listen. Ye No, yeah, a user can use any kind of sender but they should have this prompt volume and then yeah volume and decrease or increase, so we try to only recognise those words and and because we can't really say user to say same wording then it become more mechanical and yeah. And then we can have channel they can say, okay I want eight, because we don't know like users have different programmes, I mean they don't really follow same channels strict uh so we just want channel number, we don't want like B\_B\_C\_ or C\_N\_N\_ or something else because it will be complicated so we'll have only these three uh main basic uh anyway volume is not really speech recognition problem, it's it it will be take care of our main mm. Yeah actually we we can have one switch to like uh switch on, on and off, this processor and This really, suppose like here we have our main chip which controls power, volume and this part and this D\_S\_P\_s. Again, this to have some interaction like su

ppose people use D\_S\_P\_ then it particularly sends some information to the chip like in some form, like volume and like this key. So it may not be like very expensive, because since we are only focusing on T\_V\_ remote control so and we have only few things here Yeah. Um uh uh this point we didn't consider because it's it's very expensive because v our target is only like twelve point five Euros and Yeah, even automatic on off is also a bit problematic, because it different criteria for different people like so suppose people are really uh they just uh they don't touch the remote and mm y you don't know how much time you need to switch on or switch off and Yay yeah. Yeah that can be possible, especially for power settings, so user can say okay, suppose they're watching a tennis match or something then they can say okay uh after one hour I They can make Yeah we can have Yeah. Uh, not very much, like yeah. Thank you. Yep. Thank you. Can you just yeah. Yeah yeah. Mark will Uh it's in current price, yeah. Yeah. But speech recogniser can be possible. Yeah yeah yeah. Yeah, especially the power, it really consumes because it should be all the time on and Yeah. Yeah. Yeah. Yeah. Yeah I think it's good. But it's a good feature I guess yeah we need to think about more how to incorporate it. Oh. Ah it's Yeah. Yeah. Thank you, thank you very much. So I hope you're ready for this uh functional design meeting. Um so I will take the minutes you mm you three are going to do presentation. Um uh we want to know to at the end to know the new project's requirement so we need uh to know the the user uh needs that we want to fulfil to fulfil the from the technical part we want to know how it going to work and um third part uh I don't remember which is not very good. Ah of course, how to to design this uh this yeah. So um let's go for the three presentations, so first um Marketing Expert. So wait a minute. Mm. Sounds uh Mm uh. Hmm. Okay. F\_ five. Mm-hmm. Mm. Why not? Okay uh tha that's look great. Mm-hmm. Okay. Or something we don't know. Mm-hmm. Okay. I have been told that we uh don't consider teletext, that it's out of date now because of internet. Mm-hmm. Mm-hmm Mm-mm. Okay. Mm I think it's good, okay. You done a good review. Mm-hmm. Mm-hmm mm mm. Okay. That's good point. Okay. So um now I think it's the turn of the the I'm not sure um Of the technical function, so uh what effect Okay. Wait a second. Argh. So you're Okay. Let's go. Oh sorry. Okay. Oh sorry. It's off. It's on. Or you want to go to the kitchen. Mm. Um I see that you target uh several s application not only T\_V\_ but i

like we talk about um universal uh remote control. Yeah. Hmm. Mm-hmm. Hmm. S Mm. Since we were targeting a really soon uh uh date for the the the um i issuing of this uh remote control I think we will only concentrate on T\_V\_ for the moment and then maybe m make it more generalised yeah. Yeah it's it's the same solution, I think. Hmm. Yeah uh on zap it's only next next next next next, yeah. Mm-hmm. Maybe we can make uh different modes for each button and you can change mode zapping mode or uh current chan Yeah. Mm-hmm. Okay. Uh you're finish? Okay. So now the technical aspects of this new device. Mm. You prefer it. Mm-hmm. Okay. To make it quite uh an universal uh device uh. Mm. Okay. Okay. Mm-hmm. Mm-hmm. And from from the discussion we had do you can you make it on the whiteboard, or mm. Mm-hmm. Mm-hmm. Mm. On Uh train it, okay. Mm-hmm. Mm. And what about the price of this component? It mm okay. Mm. Okay. Mm-hmm. Mm-hmm. With a keywords and yeah. Mm-hmm mm. Mm-hmm. Okay. Okay. No, in no not only speech, yeah. I it's an option. Okay. Sho to to train, okay. Mm. And well, what about the idea of automatic on off on the button, yeah. Wouldn't that make uh arguments? I want uh And we can increase this the strength y you can buy one with Mm-hmm. Okay. You have mm something else to say? Uh. No. Okay, thanks. So mm mm I think, okay, we're just on time. Um mm mm. So, we're now

going to I have the lunch break. Then we will work again for thirty minutes individual work, and um we will uh meet again for the next meeting, and uh in this one want to to be more focused on the individual actions the um on the components so uh you will focus on the component concept um uh of course the U\_I\_D\_ Mark will be uh focused on the user interface concept and uh our m Market Expert Sammy Benjo uh on the trend watching. So um of course like before specific instruction will be sent to you by your personal personal coach. Well I think that's all. And we have um maybe we have to we say, only for T\_V\_, not teletext? Uh I think automatic on off control uh it's not possible. Yeah, maybe in the next uh step if we make it work um. Yeah, implemented. O okay, we can think about that. And um do you see something else? Uh yeah that's Or maybe you want to phone him. Since now all yeah? Think Uh-huh. And uh And it's answered. Clap clap clap it's a good I I think it's universal. What about people without hand? Yeah. Mm uh okay. Mm-hmm. Okay. Mm-hmm. Mm-hmm, so let's to think s so that yeah. I think that could be in the component uh concept uh. It yes. Okay. So, yeah, let's go to lunch. Sammy Benjo. I know this name uh. We met before. F\_F\_ five. Agree. R\_S\_I\_ mm-hmm. No, I don't think so. Okay. But twenty six percent, do you know Twenty five. Every fourth, you know. Every four some of us knows. One of us Mm-hmm. Functions. Mm-hmm. I got one question, uh you are a Market Expert so should we aim at the young people or not? Okay, then teletext is used less. Okay. Mm-hmm. Mm-hmm. Mm. Okay. That's me. That's but this but number three, yes. Mm-hmm. So, my name is Mark Dwight, and um I am responsible for User Interface Design. However, uh mm Project Manager asked me to give you some presentation about technical functions design. Uh, as I'm a more an artist that's gonna be less technical functions but more User Interface and current intentions and everything which is linked with this. So next slide please. And uh a general method which is seems to be very useful for our task is not to forget about uh Occam razor. We should never complicate things too much. We should only make a remote control, nothing more. Nothing more than this, just a remote control. 'Cause current remote controls they are never easy enough to use. So, make a click, please. So here is this remote control. It's quite a standard one, but it's not from a T\_V\_, it's from a much easier device like air conditioning or something. But you know, we can use it for a T\_V\_ easily. Only buttons we need is on off, volume, channels and maybe some options or something else, and please make a click, compared to this one which one would you prefer? I guess this. Sure, sure. Yeah, and our method is going to be, provide simple simple desires into simple actions. Findings. Our question of the style, we should

remember that our company puts fashion into electronics and we should never forget about it. Concept. Be simple. Be simple and you'll lean on this market. Market is a of remote controls you know it better, it's very well, it's it's not an easy field to to play, you know? So be simple. For personal preferences I think that to make a baby-proof remote control it got to be a titanium. It's a really good style, it going to be look like like this. It is unbreakable and it is very universal. W we'll have a screen with a back light which can change colours, and we can put all the options into this screen. We'll need only few buttons. All the other things can be controlled through the screen. And all these buttons should be easy to find and to click, 'cause when you watch a movie and you want to change something, you always try to find a good button and click it, but you should do it by touching it and finding it easily just by touch. So Press I would propose this concept for design, just few buttons, a screen with a back light which can change colours, titanium I think, and uh what else? I got

just very few and good ideas. We need power and volume. And let us include two nice features into this device, first, power on and off can be made fully automatic. When you go to the sofa, take your control and point it to the T\_V\_, the T\_V\_ turns on. When you don't touch the control but you go out of the For for enough time like uh you It's a question to our technical design, our two engineers. And another nice feature that I would like to implement is uh volume control. Suppose you set u you set up some volume and then you move out or you move to the other corner of the room and take your control with you. Like, you want to to change the chair or you want to move to the armchair from the sofa or something, and then the volume changes. It's easy to do, you just control the According to the distance. Yeah yeah yeah. So I think it can be just a menu which can be controlled with a left, right, up, down and enter. So, its main purpose in fact is a back light, which change colours, which makes it easier to find, and each can it can respond for your voice, like it can turn on the light for you just to f find it easily, yeah? So basically that's it. Can be easily done, 'cause you got simple designs, y we should put it to simple actions. Let it be universal, so you want to use it for your hi-fi system. You want to change tracks and you want to adjust volume. Just few actions, a few actions for everything. All the rest, we sh we'll put it into this menu on the screen. Okay, okay. Okay, but it's quite universal you know. We can just extend it to any device. Uh twenty five. Mm-hmm. In fact I would propose another solution. Basically you use just four or five channels, right? Yeah. So uh set up your T\_V\_ set like channels that you use they're one, two, three and five, and you will never have to go to a twenty fives channel. Mm-hmm. Mm. We got these buttons here. Next next. Or say this can be back. Could we carry out some research if we w really need this, like how many people really need to go to channel number twenty five and then to sixty four? Okay. Okay. Alright? Thanks for your attention. Too complex. Okay. Okay. Um. Okay. No you know it's a conceptual question, 'cause now I see th this the picture in front of my eyes like a user taking his remote control and shouting into it, volume up, volume up, and and he's coming you know, he's really annoyed with this, down, up, down. Okay, for this budget like twelve Euros. Mm-hmm. Okay.. Mm-hmm, mm-hmm. Did you consider the r gest uh gesture recognition? Like, if I want to put volume up I like do mm I take my remote control do like something like roll 'em up or roll 'em down. Mm why? That's just We got a really good Market Expert. Let's send more, let's sell more. Okay. Uh, should it be equipped with the uh, with uh speakers? Like, you want to find it, you shout control, and it answers is I'm here? Or Just beeps? I can't whistle. No, no, I can't. Mm. Okay. Just don't interfere with other devices like 'cause like all these people do that their lights are turning on with clapping. Yeah, I got it at my home, like. Oops.

---

# Meeting ID: 102

Data Source: Train

## Executive Summary

This last meeting started with the presentation of a remote control prototype. It has on-off and volume buttons, an LCD screen (it can be active or switched off) in various colours, which largely replaces the use of push buttons, and a jog-wheel for navigation and option selection in the menus presented on the LCD. It also includes speech recognition as an alternative interface, which also serves as mechanism for locating the device. It was designed to be powered by a single battery. The casing will be made of titanium with rubber strawberries following the fruit and veg fashion. The prototype was evaluated on a scale of 1(excellent)-7(very bad) in terms of fancifulness, technology, robustness, usefulness, size, colour and shape and customizability: the average mark was 2.17; the team were satisfied with their prototype, although after costs were calculated it proved very expensive. Finally, the team evaluated the whole process: they deemed themselves a good team, they found there was plenty of room for creativity and they liked the project manager's leadership.

## Complete Meeting Transcript

Yes. And chocolate? Mm-hmm. Yes, and place some slides. Uh, participant three. Prototype. Uh, so this is our remote control. It's a r working prototype. You can use it now by switching all these buttons. So first, I present as we came to this perfect model, and then we'll give some technical specifications. That's well, so that's that. Please, next slide. We analysed all the fruits and contacted NASA, and uh made some real good Yeah. If you can see this, and the stars are showing that. And um, s society will accept that. For sure. And making some analysis of different fruits, we choose the ultimate form, ultimate colours, and uh ultimate smell of it. S please, next slide. But we still didn't want to go far from our titanium idea, 'cause it's the most of the moder the m the modern material we can p select. And it's practical. And it's still say it's for our needs, so please press something. And as I said, it's perfect. Please press it. Everyone is f really uh really glad to obtain an s such a r such a device. So you can touch it with your hands. Sure. Yes. N You must say it. Yeah. Okay. Y and we got the answer. Uh, it is, yes, of course., please next slide. Um, this is a prototype. You can have a look at it, and That's all I wanted to say. Now it's technical specification by our colleague. We are still working on titanium. So, r

we'll start with L\_C\_D\_. You can ask Bob. It's Tuesday. That's location sensors. Yeah, and we can just some strawberry first. Um Oops. Let's make a party first maybe. Feel the weight. Really. Okay. Two. Two. Yeah, yeah, yeah. Yeah. Uh No. No. How can I say this. It's still it's still working, and your daughter got a bonus. A strawberry. You can. You go you So, the basic mode Yeah. So that's simple. The basic mode is uh you got just two buttons and a jog dial. With two buttons, you do this like uh volume up, volume down. Or if you go to the site, it's channel up channel down. And if you want to make to s twenty-five, you push on this. You select twenty, you select five. That's it. No. Yeah. Yeah. It's a jog dial for controlling the cursor on the L\_C\_D\_ screen. Like, selecting the menus. Sure, without titanium alloy, it's going to be light. Of course. Okay. Okay. And Moreover, moreover it covers it covers all the end goals. Even if it is, you know, it's very rounded, but still you got some rubber fruit here, and it's completely uh completely secure to leave it uh with children and that. Okay. Okay. Sure, sure, just look at it. It's full adaptable. Yeah, you can fit it into your palm, you know. Mm, It's two point one seven. No, uh you just Number. Yeah. How What what's the limit? Uh, it's it's okay that I don't know, 'cause uh it's not my field. Twelve bucks. Okay, now Mm-hmm. Check that number also. It's it's flat. It's flat. But it is flat, you Look. It's curvable, but it's not curved. Oh, okay. Mm. Mm. Well, n Why three? Why three? For buttons. No, buttons just normal. That's for buttons. But buttons are standard. Well, as you may know there's some research done in the field of producing energy from mechanical eng, I mean, producing electricity from mechanical energy. So, the point is that when you take device and push the button, you produce enough energy to make electricity. Yeah, that you don't need a battery. So, it's something like hand dynamo robot. A real high-tech version of it. Okay, but I Why not. Let's do that. And I propose to So uh, about chips. Advanced chip on print, right? So, put minus one there, please. Why not? And? So, was there result? Let's have a look. Why? Oops. Yeah. Why not. Minus. Good. And a battery and a battery, yeah. Now it's fancy, let's add one instead of two. Well, I don't know. I don't know. I am not sure who was programming this calculator, you know. 'Cause uh I wonder if we put A\_ or B\_ somewhere instead of a number. Next slide. Okay. Yeah, yeah. Yeah. M maybe not, huh? What was the Oh yeah, what was good? Everything. What was bad? Yeah. A good leader, you know, a go

od leader is somewhere in the shade and Of course. Uh Not to waste time, that's important. We need time f New materials. Budget. Alright.. Okay. Yeah, it is. So, we see, we can even forecast. they propose us like celebration, everything, we could forecast it, right? You? It was you. Okay. Okay. Mm. So, uh now it's the Hi Sammy. It's the detail design meeting, so we're going last meeting. So um, first uh Mark and Rama are going to present uh the prototype. Uh then uh Sammy will propose some uh crite cr criteria to evaluate this prototype. Then, w we And then we going to do some finance to see if uh it is uh feasible and uh at the end we will we will um evaluate ourself as a team. And that's all. Okay. So first, let's uh see the prototype. Okay. And you have some slides then? Yeah. Mm. Okay. Uh so in which uh Mm okay. Mm. Mm-hmm. MASA? Okay. What do you say? One day. He Hmm. Mm-hmm. Mm-hmm. Bobby. Mm-hmm. Hmm. 'Kay. Are colourful. Yeah. Ho-ho. That's for the L\_C\_D\_ or for the titanium? Mm-mm. Hey, you know you're theme today. Hmm. And w wait, wh what are the strawberries for? Wh wh Mm-hmm. Okay. Strawberries. Ah. Okay. Mm-hmm. Uh we'll see in the financial part if uh all gets into W Who is the five uh fifty millions we first make a party in? Mm-hmm. Okay. Uh, so Let's uh, yeah, let's see if uh th it's meet the evaluation criterium. Oops. Okay. Mm-hmm. Uh, I think that fancy, we can say it is fancy. Oh. I am not the d the only one choosing, yeah. Uh what do you think? Uh-huh. Yeah. Yeah. It's in the other. Yeah. Mm. Two. Let's say two, yeah. Change colour of t Yeah, I think it's a Yeah. Yeah. Mm-mm. Um The strawberries Oh. Mm-mm. Yeah. But it's too. It's um robust, yeah. Oh, yeah, lets me try. Yeah. What is uh next, please? And you can uh do di two sites? Yeah. Okay, also. You can,

by using the You c push here the the yeah. Let me understand well, because I'm not sure that's for that this one are b d uh two dir directional button. Yeah, two Yeah. Yeah. And which what is that? Okay, okay. It's a kind Oh, okay okay. Oh oh okay, great. Now it's looks us useful. Yeah. Yeah. Mm-mm. Mm-hmm. Mm-mm. Uh-oh. Yeah. Yeah. Yeah, it's. Let's imagine. And what about the strawberries on the top? I'm not convince. But maybe I'm not trendy. But, uh Yeah, but uh uh they're not useful. I I mean it that's uh Mm-hmm. Yep. Hmm. I would have m uh i found more fancy that the fruits are useful. Yeah. Mm-hmm. But the n Yeah. Mm. No, I'm not sure uh why uh if it was like this I It's n no, it's not fancy any more. Okay. Uh-huh. And different routes. Okay, I see what Okay, so you you you feel like it's something uh a protection for the remote control. Also. Okay. Okay. Okay. Wow, that's a Yea Yeah, it's fudge titanium. You know. Right, yeah. And uh Okay. Let's go for one. Yeah. So it's a good evaluation. Yeah. Mm. Mm-mm. Okay. So now, it has to fulfil the financial criterium? So, I have an Here. Um. Okay, so two. Uh-huh. Oh. Yeah yeah, but the price is two. Oh, number. Sorry sorry sorry. I'm sorry. Yeah. Yeah. Oh. No, never. H Okay. And for the One also. I thought you can curve somebody. Mm-hmm. Oh see, I I think that the the price is this one. Yeah, yeah. Don't chip on me. Mm-hmm. Mm-mm. Yeah. But she wanted u the fudge titanium. I think it's five, but you don't say. Mm. Oh, sorry. Again, I'm See it. Special colour, or it's only on the Yeah, but there is no colour here. So I put it here. How many push-button? Three or two? Is there The scroll-wheel, okay. Okay. Um That's that's not We choose this one, and not this one. Or only a scroll-wheel. You try to s No, no, no. Because how do you do to y select? Yeah, I mean you you go on the location with your scroll wheel and then you Stay longer. Okay. Oops. Okay, okay. Um Mm-hmm. You you have all of these, no? Mm maybe n not this one but Yeah, so Not special colours an interest in? And buttons are not colourised? They are m Boo-hoo. It's already too expensive. Apparently. Yeah. Mm. Mm-hmm. Mm. So think of what we c

an cut uh here. Apparently, we have to choose one or the other. But you don't need a battery? Mm. But um it's like the hand dynamo, no? Uh it's a it's a beginning. Okay. So One here and here. 'Kay. Mm-hmm. Mm. That's right. M maybe minus uh three, no? Mm-hmm. Mm. So Oh, sorry. Mm-hmm. Mm. Okay. Oh, we can put uh a hand dynamo and a battery if you want. Oh. Both its it's cool. Mm. Yeah, yeah y Yeah. Mm. It's maximum and don't have to Yeah, yeah. Uh Uh, mm-mm. Yeah. Mm. Okay. Mm. So target reached. It's um English uh Yeah. Yeah, but uh is uh English. So Mm. Mm, let's try. Okay. I save it uh Okay, so next mm No, that's yours. Sorry. 'Kay. Okay. So now We have to make um Yeah. Yeah. Mm. See mm how Are we a good team? Mm. Mm-hmm. Mm. Is there enough room for creativity? Mm. And you. Mm. Oh. Okay. Well, project evaluation. So, you say, is there sheep? Luck. Okay. So luck, but good. Which imply good uh team performance. Mm-hmm. Okay. Mm. Okay. A lot of uh Yeah, uh new ways of doing financial Mm. Mm. They're working on um pink titanium. Mm yeah. Yeah, we're really nice. Yeah. Mm. Okay. I think it's Yeah. Uh How Yeah. Mm. I'm the one, proposing the celebration. Of course, you know I'm the program manager. Mm-hmm. Ah um, I think it's finish. Yeah. Mm. Mm-mm. And we go to the party. thank you to you. Mm. So, Hi Christa. Yes. Mm.. Yeah. Mm-hmm. Such a nice thing. Can I? Ho-ho. It says I will uh I'll buy it. If I if I need so. Hopefully my daughter will like it. Yes, of course. Of c course. Ah. Oh, there is a button missing. Okay. It's in option. Hmm. Mm-hmm. Hey, babe. Bob. Hey Bob. Okay, that's good. Oh, these are strawberries. Fruit smelling spongy titanium. I didn't know it exist, but that's great. Ha. You mean we can change the colour uh of th Yeah. Yeah okay, for the L\_C\_D\_. Tit titanium is Uh, okay. Yeah, Bob, please. Tuesday colour. Okay. Mm-hmm. Black for Sunday. On the L\_C\_D\_? Oh. Of course. What do you think? Strawberry sensors. Very useful. Lounge meeting. Alright. Good. So, huh. Interesting. In interesting. Mm mm. It makes sense. So uh, this is What a design. It's my turn. Mm-hmm. Let's see if this Yeah, if

you meet the evaluation criterion. Yeah. So, evaluation please. So. You made a very nice prototype, and um, I think, we now need altogether to try to evaluate it to see if it makes sense to do it, if it fulfils our what we want to do, and things like that. So mm Uh, next slide, please. As you know, before going and uh creating and producing these strawberry uh remote control, it's very important to first verify if it makes sense, if we have a chance to sell it. Uh, so we need to evaluate it um, try to do it in a constative way, and as much as we can. To so what I propose is that we are going to have this scale from one to seven. One meaning that, ye yes uh it fulfils uh the the criterion, whatever it is. And seven meaning, no it doesn't fulfil at all. And we're all I going to list all the criterion. I'm going to go to that next slide, and together try to evaluate this according to this criterion and from one to seven. And then we are just going to have an average, which will give us the value of our uh remote control. So, maybe we can have a look at the criteria? So these are the criterion uh I'm I thought were important. Of course, this can be discussed, but let's let's see, so let's vote. So we have fancy here and we have the scale from one to seven with four in the middle. So, what do you think, is it fancy? It is very very fancy. Or have you ever seen something like that? Yeah, of course. What do you think? Is it The weight is later. Now we're We're on the fanciness now. I think it's quite fancy. It's uh Yeah, so No it's it's one. Yeah, o one means it's, yes, a very fancy and seven mean no at all. So it's one or two. What do you think? Two? Okay. So here, two. Up. Then we have uh technology. So, what about technology? We have uh we have speech recognition, we have location based, we have L\_C\_D\_. Change colour, I mean

that's very Quite d I think it's a one for that, at least. At least a one, yeah. Robustness, uh-huh. So let's suppose my daughter take it and um and through it away. Do you think it makes sense that it's going to live again? Uh, maybe not the prototype. Let's try. Oh my god. Okay, we just lost one strawberry. So Not at all? It is Yeah. Yeah. So it's not so bad. I um uh I would say three. Yeah, that does make sense, yeah? Useful. Well, so the question is does it have uh the minimum requirement of re remote control? So I don't know. These buttons are uh It not clear. But you have at least uh next produce. Uh, it depends on the Okay. So but, for instance, because the L\_C\_D\_ is not uh touch control, touch screen, you cannot go to channel twenty five directly. Directly. Yeah. Oh, it's a jog dial, okay. Uh-huh. Okay. Yeah. Okay. It's much longer than that that being two two five, no? Don't you think so? May not okay, we can go. That's uh You're right. That's it's less uh Yeah. But it's it's nice, because people anyway don't go there. But So what do you think for it, usefulness? Seems to be useful. Both. Yeah. Yeah. Up down or left right. Yeah. That Cool. I would say then uh Two or three? Two or three? Two. Okay, two. So size and weight. Is it the the the effective size and weight that the Is it uh real size, real weight? Or Because it Size is going to be that, yeah? Uh, and and It's going to be lighter, because this seems to be very heavy f I mean, for my daughter, for instance. Not sure if uh she can use it. So, should be okay. Up to three for that, because I'm haven't seen the weight so I must not uh Colour and shape. Well, so colour, it seems that we have the several colours for the L\_C\_D\_. But um, it's not very clear what is the colour of the sh the sh the case. It's a it's going to be titanium. Okay, okay. That's nice. I think it's good. Okay. Yahoo. Well y you know, it's this uh fruit and vegetable year. So Uh, I think usefulness is m as as I rem um just have to remind you that usefulness is much less important than fanciness. Whether it's fancy or not now, it we have to decide. But this If it's Uh-huh. So, that they will that maybe the fruit may be here instead.. So, it seems we are not so clear on the shape uh I suggested three. Because uh, everybody s doesn't seem to be convince, although it's quite You have good arguments. But And uh the last one is adaptive. This is not r maybe not as important as the other one, but uh can we adapt it to each each personal use? Great. Fully adaptable. That's Yeah. So you can fit into your palm, okay. That What else can we need? You Do you think you are gonna be able to do that with ti titanium as well? It's

fudge, yeah, yeah. Yeah, fruit titanium, yeah. Well, I if if this is if you are ready to do that, then I think it deserves a one. Okay. Now we have to do the average. Who is good in math? Okay. Two point one seven. That's nice. Two point one seven out of seven. I think we have a good good thing. Well, that's all I had to say about the evaluation. So It seems to be good, yeah. We have uh Yeah. Yeah. Okay. Thanks. Ah-ha. So so how many batteries do we need? One battery? Good. Why two? Say no. No, ne never install. Two batteries or one? Only one. No, no. But no, no. No, no way. Yeah. You never use uh Excel? Good. It's twelve bucks. Twelve bucks. Twelve and a half, I think. Okay. Okay, electronics. So It's a simple chip? Simple chip, okay. One. Okay. One or two? One? Okay. So the case, which one uh is it in the end? Let's do a single curve. It's flat, and curved. It's curvable. Maybe there is a supplement for that, no? It's only curve? Okay, let's go. This Okay, you d We tried, we tried. So, what is it? T titanium? Mm, that's expensive. Mm-hmm. Okay. Let's stick to s titan. Special colour? No because uh Yeah. Oh. So the L\_C\_D\_ Two. Yeah. It's going to be expensive. That's all? No. Oh, I think, no it's Uh, is it a scroll wheel and pe push button, th this centre one? Or only only scroll whe

el, okay. You are trying to make make up make us up. No, but you select with the two d the other two buttons, no? That's true. Yeah. Yeah. It should stay. Yeah. She's very hard on this. Special colour? Yeah. No. Special material? Yeah, buttons are the standard buttons. Yeah. It's only buttons, these. Nothing special. Okay. So we are at seventeen dot eight. No, the colour is in the L\_C\_D\_. I no. We can just use this red. It's So what is Are we supposed to cut things out now? Uh, until we get twelve fifty. Well, if I look at what is the most expensive things, uh it's the L\_C\_D\_ and the speaker. Yeah. Yeah. Mm-hmm. So that would So, but if we select the hand dynamo it's okay, we only We we win one. That's already that. Okay, let's do that. I'm not sure if this is legal. And? No. Okay, let's see. Yeah, yeah, yeah, if Click somewhere, you'll see features. Yes, it does. Maybe put minus two, so it looks uh more reasonable. Yeah, anyway No, minus two. Nobody will know. It's not recorded, is it? Okay, we're on time. Good. No, now we are exp exceeding I think. It Is it? I think we're exceeding now. We have to remove the Uh, it's better. I think they are counting uh We would prefer, yeah. Maximum is maximum. So, remove one of them. Yeah. Okay. Okay, we're uh on target. I'm just curious to see this uh my address chip on print. Trick. Uh, I would say it's the Russian trick, but Anyway No, they may have some their origins, strange origins No, no, no. Let's finish this meeting instead. What else? No. This is right. Okay, so finance, that's done. Are the cost under twelve? Yes. Project evaluation, good. Project process. Safe uh asse uh safe assessment. Yeah, I think we've listened to everybody. Everybody could say what they thought. And uh Yeah. When we see the results, there is no doubt there Maybe a lack of leadership? Team-work, very strong, I would say. Team-work, no problem. Means. Whiteboard, digital pens. Yeah, I think white-board is useful. Digital pens, useful. New ideas found? Yeah. But uh Yeah, but uh then I I mus That's true. And there's uh one very important point. We're on time. Meetings finish when they have to or even before. The for meeting it's uh one of the most important thing. Yeah. Yeah, we have other uh remote controls to create. Mm.. Mm, yeah. Hey, just wondering if my uh what about the the pink the pinkness of that uh. They are working on a Okay, good. I think we are great. There's no no other words for that. We are probably the best. Real Reaction is uh Yeah. Yeah. Finished? Ah, celebration. Are the costs within the budget? Of course they are. Yeah. Is the project evaluated? Yes, it is. To whom? To the whole our company? So, let's celebrate. Uh I think the meeting The meeting is over at least. So, we have to go out. Yeah, yeah, yeah. Yeah. Uh, here we have our prototype model. Yeah. Yeah, we have also some slides. In Yeah. Five. Him.. Experience. Explanat See this. You can Spongy. Hmm. So Yeah. This this is really flexible. You can add your buttons. Yeah. So function, mm So, as we discussed, we have to switch on switch off whenever we want. And so, we have buttons and

using L\_C\_D\_, or like you can use this jog wheel and select which ever option on the L\_C\_D\_, and then do on and off. Then you ha you'll have volume control. So, you you can press these buttons to increase or decrease the volume. And we have some L\_C\_D\_ controls. Like, m switching the L\_C\_D\_ display if you want to use L\_C\_D\_, or you don't want you can just use normal button. And we have speech recognition. Here you have microphone, and then it date records your voice, and then it try to recognise. And it can also do the action. And location finder. And we want to do the location basically using speech recogniser. You can just say, where is my remote control. Or uh, you can just give some nickname to your remote control, like Bobby. And then, it will say hi. Yeah, hi, and then you can use it. So, um our team is now fruits. Mainly strawberry. So, you can h

ave And then you can see the look L\_C\_D\_ and all the switches. Material, we want to stick to titanium. We will send, we want to Yeah, or s So, we want to have simple and perfect shapes, like I shown in these phones. You can have your own designs and and you can feel simple designs. And you can choose colours on your day for each day, or even many colours. For the L\_C\_D\_. With titanium it's it is silver. Yeah. Mm, yeah. Yeah. Yeah. Even you can configure your colours for its the depending on your mood, or s And you can have many colours on weekends. Or Huh? Ah, these are like sensors. So, after this meeting we'll propose a party for our success for So, if you are vegetarian or you have any options, please let us know. Yeah. S So, any specific questions for Yeah. Yeah. Then we can discuss We can Yeah, then we can have how much for how money is left. Yeah. Fudge. Yeah. Fancy. Huh. Yeah, what's is really Uh, it's really Yeah. Oh. Yeah, yeah. We can give at least five or six, seven. Oh, Oh. So Oh, okay. Yeah, okay. Oh, okay. So M maybe two. Technology. Yeah. Um And we have L\_C\_D\_. So you change colours. Useful. Yeah, yeah. It's silly. Uh, still we need to cha Yeah, it Maybe strawberry. Oh. Yeah, we can easily plug it. Yeah, yeah. Yeah. Useful? Yeah, Yeah. Yeah, channel. I this is volume control and channel changes. These are the main You Yeah. Yeah, and you can do on L\_C\_D\_ using these going to scrolling all the option. So if you don't want Yeah, um yeah. Yeah. And channel. You can select. Yeah mm. Yeah, yeah, yeah. Y you need to like press two and five and Yeah. Yeah, yeah. Yeah mm. So, d Yeah, we need to address we want we only address two main functions here and the other functions will be on L\_C\_D\_. So so Yeah. Yeah. Up. This is jog wheel. Yeah. Um, see in L\_C\_D\_, like you will have blocks and you select which one. Yeah. Yeah. Two, maybe. Yeah, yeah. Yeah, it's size al almost Yeah, because it is The weight will be bit lighter. We will s We use titanium. Yeah. Yeah. Yeah. Heavy. Yeah. Yeah. But sides uh, the sides should be okay.. Yeah mm. Oh. Yeah. The case is silver titanium, no? Yeah. Oh. Yeah, yeah. Yeah. So maybe, I think Yeah. Yeah, well Yeah. Um Yeah, well then it's bit difficult to use. Not like this d We're just giving the fruit for more fanciness and more attraction, too. So, maybe think we can have rubber or some sponges, stuff for strawberries and different colours. So it's Even These buttons But it looks really not really good. I mean, the f Yeah. So these are kind of rubber things. Even if you lose one you can just put whatever. Even we can provide many different colours or different fruits, and Yeah. Yeah. Yeah. Yeah. Yeah. Yeah, we've yeah we have sensors here and so here and here, so we just Yeah, so even if you don't put, it works. But this is really fancy. Yeah. Yeah. Yeah. Yeah. You can Yeah. Yeah. Yeah. Three, three, six, eight, eleven. Hmm.. Yeah mm. Yeah, two one one seven, we have. So Financi Energy. Uh, we use bat One battery. Yep. Oh, we just need one, I guess. No, number is one. We need only one battery. Number, number. So we We have sample chip. Uh, like simple chip, yeah. So, yeah. Yeah. Four buttons at least. And then we have the t sample speaker sensor for speech recognition. Yeah, one to one. Yeah, one. Yeah, I think we will go for a single curve, no? Oh, is Oh. Oh, okay. Yeah. Oh. Titanium. Yeah, well No, only one, no? Um Interface. Yes, in L\_C\_D\_ display. Ok Yeah, an Yeah. Push-button. Scro Uh, two. Yeah.

One scroll wheel. One L\_C\_D\_ displayed. Yeah. Yeah, it's cheaper. Yeah. Only scroll wheel. Yeah mm. So It's already Ah. Y ye Yeah. Then it automatically we can just do like you feel, it goes. And it will activate Um, plus, yeah, it's price is really Special colours, yeah. Okay. Yeah, buttons and strawberries. Yeah. Special form. Uh, we have titan Yeah. Mm, hmm, I think uh because you can just go for a good colours. Yeah, and uh Yeah. Oh. Sample speaker. Yeah. Yeah. Maybe the jog wheel can be li

ke kind of hand is Yeah. Yeah. Yeah, just remo S Yeah. Uh, no. Yeah. No, no. It's not It's not changing, no? It you don't So now on, we can increase our Still you have two more. Maybe we can use it for our party. Yeah. Yeah, yeah. Yeah, that No, but point five point three. Okay. Is really strict? Oh. Oh yeah. Ho Oh. Uh And we can discuss all these things in our party. Mm yeah, very much. Yeah, yeah. Yeah, it's really Yeah. Yeah, our team-work is really strong. Oh, we still, I guess. Hmm. Don't really. Yeah. And we also Mm. We made Mm. Hmm. Ah, we got new idea, speech recognition, location finding. New materials, new s uh this fancy strawberry design. And new tricks. Ah, very. Yeah. Yeah. Yeah, yeah, it's We got two Good score. Oh, okay. So where we will go now? Uh, ye Will go to Italian restaurant, or Ah, okay. We can decide. Yeah. Yeah. Thank you.

---

# Meeting ID: 54

Data Source: Train

## Executive Summary

Um , once again I'm uh gonna take minutes . Uh , first we have a prototype presentation by G\_ and G\_ . Uh evaluation crit criteria . Uh , in combination with the finance I um uh I received uh a an uh an Excel uh file which we have to fill in later on . Uh , and then we must see uh if we uh stay under the twelve and a half Euro . And after that , uh uh an evaluation of uh the process how we uh how we have done it here with the SMARTboard , with the with our laptops , with the all uh all this . Once again , forty minutes , I would g give the word to um G\_ and G\_ for the prototype presentation . Shall Yeah , well sure . Um , this was our first concept . We decided to use a single touch-screen . And um , well , we began with uh with a form of shape , that is uh is easy to hold w in one hand , left or right handed . Um well , during the meeting I showed you the concept of uh placing the buttons on top , usable with your thumb , and uh the menu structure , uh if necessary , with your other hand , Yeah , uh well , and as you saw , we would just have the basic remote with the panel L\_C\_D\_ uh screen . Well , these would be the main buttons , h you could uh change them later on in your own profile if you want to . We have the more advanced menu uh setting right here . We have the sub-menus and stu stuff . As you can see , this uh there , there are uh two uh weird bumps in it . This is for uh the added uh effect of uh well uh y youth and dynamic . And so when you put it on the table , it will just lay down . The s panel we g you would hide with some more uh rubber layers , But the overlaying layer is uh a little bit uh curved and stuff . you can make a more thinner uh design , So , you have room here for your battery S and you can just be the the layer of the touchscreen and some have some wires underneath it to make it as uh thin as possible in the middle for good grip . Uh , you can see there's a v a very uh youthful uh dynamic uh exterior . it's like an uh Easter egg . Yeah , it's like an e but this is for children . We we want a more adult version . So this actually basic the idea . We we just want to build a more uh adult vers adult version of of this . And and for colours , we we figured starting with basic colours like uh white or metallic grey . Those are the technological colours actually , It would be best to to appeal to a broad public and make the covers exchangeable , so the young people will buy an orange and a red and blue and a purple , but when the o older people uh go in the shop and they see uh an orange um remote control , it would be less appealing than a white one . And young people , we think , are a little bit more flexible , they think , ah I'll buy for a couple of Euros some noi nice hip uh Maybe it's an idea to sell it without a cover , so that you can pick a cover in the in the shop . um I think a cover is necessary , So , there must be some cheap standard

cover , Yeah , but uh you d you mustn't forget that uh our target aim is younger people . So I think uh it will be a better idea to have some uh flashy fruity colours as as a standard , and for the people who uh really want uh a more sophisticated , more traditional look , they're willing to pay uh that . Yeah . Yeah , maybe yeah , perhaps you're right . Uh , maybe we could uh develop a cover uh with wood style . a wood style , a white c and uh a couple of h hip uh fruity colours . And lea uh I delivered standard with a fruity colour , but not too not too much . But , the mai I think th uh the standard must be some kind of uh uh attractive flashy colours . Not too , but w a little , Um , now is the time to uh evaluate our prototype concept to uh to the past requirements . Um , we're going to do that with a seven point scale . We have to uh be consensive about about things . We're going to vote . The remote control is designed for people with age below forty . Yeah , it's not just uh designed for people under the age of forty . It's also designed for people above forty . Yeah , two or three , The remote control is beautiful . acco according to us , it's one ? Or Of c of course you have to be uh very positive and uh enthusiastic about your own product . Uh , the remote control looks fancy . One ? The remote control has big , clear channel switching buttons . Yeah yeah , Uh , teletext buttons and volume buttons ? Teletext is in the menu . Volume is true . Yeah , the they are big and clear . . I would give it a more a five or a six . The remote control is easy to be found . Uh well , when we put in fancy colours , yeah Yeah , it has these all these fruity colours and it has a strange shape . If you put uh your normal uh remote control under your bed , or you throw this remote control under your bed , is it better findable ? It'll make a difference . Well , we p we can do it glow in the dark . Because uh four is between three and uh uh also between between true and false . uh , w uh according to uh the the other uh remote controls , there may uh uh be there in your uh T\_V\_ room , this one will stand out , I think . if this lying on your couch , you're you're you think what's that for kinda orange uh thing . If your uh fifteen remotes in a drawer , uh you find it , yeah ? But but the survey under users was that they uh really lost it . Yeah , that's stupid . Most of times when you lose it you're sitting on it . Uh the remote control has fresh , fruity colours . Um I would call uh choose two , 'cause we decided not to make two f uh fresh colours , as it would not . Yeah , yeah , not too flashy . The remote control is made of soft material . Yeah , rubber , is kind of soft . Yeah , but not too soft we have decided . Three , yeah . Easy to use . One . It's it's not the most easy to use Jus just with ten buttons , that's the easiest . Yeah , but the most uh easy to use is just with one button It is r it is rather easy to use , because you have the primary buttons always visible . Okay , two . Yeah , two . The remote control is innovative . The remote control has m remova removable from Multilux . The remote control has built-in games ? But uh , maybe make it two , because the games are in a sub-menu and not uh it's not an entire game . Yeah , but they are built in , so it's one . The remote control , i it has speech recognition . False . And the last , paren parental advisory function . Okay , we have now to c uh to calculate the production cost . Yeah , if the costs are under twelve and a half Euro , uh then we uh can uh ra uh move on to the project evaluation , as we have uh experienced it . Otherwise , we have uh do uh have to do a little uh redesign uh thingy . So Kinetic , one . Battery , yes . One . Advanced chip . So it's only uh once double-curved . We're now in a problem , 'cause uh we have uh reached eleven Euro yet . Then we'll see uh we'll we'll see uh wha how much we are over budget . Special uh is the special colour ? Yeah , but we want to make uh the wood colours , uh that uh No , this is a standard colour . Yes , this is a special colour . Yeah , if if you're honest , we'll uh type one , special colour . Yeah , but but D but Daniel , tha that's that's another brand . That's another

article Well , we're only four Euro over budget . Well , other case , we can make it single-curved or uncurved . Mm , single-curves . The kinetic thing , can we just skip it , because uh you have to shake it , but that's not really innovative . What do you think about uh putting a battery in it , but also selling like uh the covers , a docking station But you can use rechargeable batteries anyway , just you s you have to recharge them manual . well you you can go from double-curved to single-curved . so we have to bake the ba back flat , and then No , it's it's just one curve and not a back uh curved I think . Or but uh it's its' well it's its' r it is the main point of the the the the look . No advanced chip , uh that's a little bit of problem . So , if we do this , uh we're on uh twelve and a half Euro . If you make it double-curved , it costs one Euro more . Uh , there's an a a athe aesthetic value , but not functionality . But I don't know if twelve and a half is uh a fixed uh fixed price . Yeah , well let's assume it is . But I I figured that the kinetic would be a marketing promotion . No , well , y I mean uh , y you can go into your neighbour and tell him , ha , my k uh remote control is kinetic . Yeah , but it doesn't fit in our co cost profile . So because if you want to go to kinetic , you're uh you're on thirteen and a half and you must go to flat , and I think now it's it's more of uh a compromise Well , we were above , so we did a little redesign now uh it's about time to uh talk about uh this project . was there room for creativity in our meetings or in your individual meetings ? But , that's mainly because uh of the information that was delivered to us . I I didn't think so . That there was a lot of room for it . and I couldn't go on on i on the internet and search my own stuff . Bu Well , I th I think you two , uh especially you and uh and uh Daniel , you d you you both had uh the less creative uh roles in the project . I think Jeroen and I , we had a more design we could have more we had more room for creativity than than you two . Uh how about the leadership ? I thought uh the first meeting was a little bit of unstructured meeting . but you could have uh structure it a l little bit more . So like , I I was talking most of the time the first meeting meeting , and I was a I was also very uh unhappy , uh very unsatisfied uh about the and uh I think the the last two meetings uh also we we reached uh some good decisions about uh talk Yeah , more more consensus . No , it you did better . Uh , teamwork ? Well , we work together on a project , but everybody has his own task . and it's wo more like presentation and some points were discussed . Nah . Yeah , we we had some trouble with the pen , but D uh just write your name right now . Uh he he knows how it works , yeah . The idea is great , but it doesn't work properly . Uh It's it's not real real use for me . I it's the same concept as the pen , where you f have to download the software or s uh very uh slow . Be it it takes a lot of time to draw things and to write things , And the eraser was another problem . M Abo What kind of new ideas ? Well , the the idea of the touch-screen is uh New ideas about uh the working of this software , about about the project , about the remote controls or I don't know what what I mean . the mm the mean uh number is uh one point eight one point eight six . So that's fairly uh fairly good , I think . all the requirements uh are true or very true , right . Yep . People will still feel the need to to write it quickly on uh a page and not download it and save it , and You had expected it to be uh more more uh More user-friendly . And now you have to um keep constantly in mind that you're drawing on this screen . And writing text uh , yeah , you've gotta really do your best to write some Just t t type text , and that that would be uh excellent . Here . Picture from scanner , clip-art . But not the the the the predefined uh squares I think uh So there the the the functionality is there , but it's not it's not ideal , it costs a lot of time to uh To use , yeah . Uh , the costs are within the budget . Uh , the project is evaluated . because uh there must be some kind of end report . Uh about all the meetings , what we have decided , here is uh

standing uh whoa , we can celebrate now , but the end report is You have now ten minutes left to finish up the end report . Maybe we can do it uh together . So I I s I will uh put it on a story-board . Um , this is about the functional design , but you can save it u the under another name . It's a read-only version . about the three functions where uh which are most used and uh which must uh immediately be visible on our uh remote control . Um , it must be uh simple to use , very clear what to do , and at the younger people . No , you have to put uh , switch channels uh at the top , because that's the most used function and teletext at the second a volume changing , second . S switch , yes . then the conceptual design . Well , okay , maybe you can add it later that we decided in the end because of the cost . Uh , he here it is still double-curve , the rubber , the flashy , the fruity , the removable . It's not double . Nay but that this is what um Was initial , the plan . The initial plan . And the the added functions like Tetris snake , the added functions . Uh , was it included in the cost ? I don't think so , eh ? Okay , so uh anybody uh misses something here about uh Yeah , the end conclusion . that's that's what I'm gonna write b between now . Yeah , but but the the decisions are put in the uh conclusion , I think . well I gonna redesign uh something now . Oh , before you change anything maybe you um save it first . Finish meeting now . I'm going to finish my end report .

## Complete Meeting Transcript

Evaluation. Mm-hmm. That's gonna be t problem. Yeah, well sure. Hi. Yeah, uh well, and as you saw, we would just have the basic remote with the panel L\_C\_D\_ uh screen. Well, these would be the main buttons, h you could uh change them later on in your own profile if you want to. But, well it's standard they will be delivered with this kind of uh set-up. We have the more advanced menu uh setting right here. We have the sub-menus and stu stuff. We made a top oh, or a front view. Just so like you wanna uh back view. As you can see, this uh there, there are uh two uh weird bumps in it. This is for uh the added uh effect of uh well uh y youth and dynamic. And uh this is for the artistic effect. Well, what we figured is uh we'll show you a picture later on you have more b a better idea after that. But, idea is for to stay in balance with these two uh with these two. And so when you put it on the table, it will just lay down. It won't uh roll around or stuff. But it will lie more in your hand like an old telephone maybe, or like these old uh phones. Y you you may get the idea. So thi this is about uh how we figured it should be. The s panel we g you would hide with some more uh rubber layers, like we discussed early on. Uh, you would s you wouldn't see the uh straight panel, but more fluidly and round. Yeah. And uh, in these bumps you could actually uh put some electronics uh that would you can make a more thinner uh design, and that would actually look very nice, yeah. And uh, about the colour, what have Yeah, f uh, as colours, do you do you have the picture in uh Oh yeah. Now, well this is the idea about uh the bumps. Uh, you can see there's a v a very uh youthful uh dynamic uh exterior. It uh you just want to hold it you uh you are young and uh dynamic like us. Yeah, it's like an e but this is for children. We we want a more adult version. But, this is like a remote control for children.. A weemote. Yeah. Hey, that's actually a brilliant uh marketing stand. Uh, but So this actually basic the idea. We we just want to build a more uh adult vers adult version of of this. And and for colours, we we figured starting with basic colours like uh white or metallic grey. Those are the technological colours actually, so it d Or blue or whatever. Oh yeah. Yeah. Yeah. Yeah, maybe yeah, perhaps you're right. Uh, I I would I would actually agree with

this sounds logical. Nah. Yeah. Yeah, I like like this like this. This isn't this isn't too much, is it? I f Yeah. The buttons, I Yeah, uh something like this would be nice. Okay, that's that's it from us. Uh-oh. Why? Yeah, it's not just uh designed for people under the age of forty. It's also designed for people above forty. So I have I've Yeah, two or three, because it's not just uh the question is aimed at is it designed for people with age below forty. But it's also designed for people of age above forty. So, I'll say it's about three. Yeah, I I think Yeah. Yes. Yes. Yeah. Leads to user face, yeah. Yeah, false. Uh, hmm. Yeah, the they are big and clear.. Yeah, but but the teletext button. Yeah, you can ch That's in a menu. So, it's w yeah, it it it isn't entirely unclear, but So, I wouldn't give it a seven. I would give it a more a five or a six. Uh, I don't know. What do you think, uh Mister Project Manager? Hmm. Yeah. Yeah, it has these all these fruity colours and it has a strange shape. So, if you so if you have trouble finding it Well, then uh then I'll go for four. Because uh four is between three and uh uh also between between true and false. Uh, so I'll I'll go for four. Wha Yeah, that that's a better question actually. Well, if i if you see a strange shape lying somewhere, uh then you'd uh recognise it as, whoa, that is strange. Yeah. Yeah, what is that. Uh, so it's Yeah. Yeah, rubber, is kind of soft. Well, I don't yeah, it is kind of It No. Uh It could yeah. Functional ability.. No, it's it I'll go for two. My vote's on two. Yes. Yes, it Yeah, they are built in. Not down.

You really like the parental advisory. Bu Yeah, he made it. No. Me, too. Yes. Yeah. Yeah. Yeah. Yeah. Uh, n no. No. Yes. No. Uh, we have one. We have one. No, sev zero. Well, that's um yeah, speech recognition and s A zero. No. No. Yeah. Just go on. Then we'll see uh we'll we'll see uh wha how much we are over budget. Zero. I don't think so. No, this is a standard colour. Yes, this is a special colour. That's an add-on. No. These three. Well, we're only four Euro over budget. But Well, other case, we can make it single-curved or uncurved. Yeah. Okay, sure. Yeah, sure. Okay, well you you can go from double-curved to single-curved. And that would solve the budget problem. Yeah. It's just yeah well, the single-curve that Yeah. Exactly, yeah. We going to cut Yeah, we just make it flat. But, you do I Function. Worth, does it have added worth? No, um Yeah, well let's assume it is. We we should assume it i that it is. But I I figured that the kinetic would be a marketing promotion. R if you uh promote a kinetic um I kinetic remote control, I mean, that would b sell better than an a normal remote control. No, well, y I mean uh, y you can go into your neighbour and tell him, ha, my k uh remote control is kinetic. You have standard old battery control uh remote con True. It is possible, but you can't use double uh curves for titanium. That's one of the functionability uh Well, I th I think you two, uh especially you and uh and uh Daniel, you d you you both had uh the less creative uh roles in the project. 'Cause I think m I think Jeroen and I, we had a more design we could have more we had more room for creativity than than you two. Ha. Nah, the leadership wasn't crappy, it was the leader that was crappy. Nah. No, the leadership was okay. Yeah, it was good. Try to learn from your mistake. And we will never do it again. Yeah, that went w it went well. It's it's just uh Nah. Yeah, we we had some trouble with the pen, but Yeah, but us Yeah. Oh. No, I have it working. But, uh yeah, well uh No, it doesn't have that much added value to the Yeah. Know what I mean. Or text function. Just t t type text, and that that would be uh excellent. Mean Oh. But uh, problem is, well you can't discuss anything well you you ca uh you can, but you will discuss a lot less than I like we did now. We I mean uh w w w one one person s maybe said three. But, well uh I we said uh, no I w th think two, because this and this, and then you can react uh on it. But if you you put a three on it, uh just figure well, everybody knows what I'm knowing, so they'll all just put a two on. Yeah, but it would yeah. Yeah okay, the for processing part. But then uh, I think the idea of one person entering it and the rest uh discussing it, that uh isn't that bad idea, actually. Not that your opinion isn't valued, but but still. Yeah, sure. Y yikes. Seventy five pages. So you you finished it actually, and so we

just have to read it and say yes or no? It's not double. Uh, it's not double anymore, eh? Yeah, okay. Yeah. On thing uh One small thing uh, the added functions. Uh, was it included in the cost? I don't think so, eh? It's very cheap. Okay, um hereby is the meeting is finished. J\_ and J\_. Evaluation. Hmm. Hmm. Interesting. Ah, okay. Cool. J\_ and J\_. Jane and Jane. 'Kay guys, take it away. Hmm. Okay. Yeah. Okay. Hmm. 'S I it's like an uh Easter egg. Weemote. Wait what I w got in mind. Mm-hmm. Hmm. Hmm. Maybe it's an idea to sell it without a cover, so that you can pick a cover in the in the shop. Yeah, okay. Yeah, okay. Hmm. Mm. Oui okay. Yeah. An another idea. Uh, maybe we could uh develop a cover uh with wood style. They'll please the elder users as well. Yes. Not not too uh yeah. Yeah, exactly. Yeah. Or blue or. Well I I I think so. Yeah, except for the buttons it's it could be a standard model. 'Kay, it's my time now. Okay. During the Oh. During the design uh design life-cycle we uh we made lot of requirements and trend analysis and stuff. Um, now is the time to uh evaluate o

ur prototype concept to uh to the past requirements. So we are going to evaluate the design according to the past user requirements and trends analysis. Um, we're going to do that with a seven point scale. Opening a Word document now. Okay. One oh, okay, uh I have to expla explain something. We have to uh be consensive about about things. So, it has to be a group uh group decision. Okay? Uh We're going to vote. We yeah? The prototype. Yeah. Okay, one. The remote control is designed for people with age below forty. Seven is false. Yeah, b one or Most true? Yeah, so so a o one is appropriate? Or, more like a four. Three. Ah, exactly. Exactly. Three. Yeah. But also for yeah, okay. Uh, second. The remote control is beautiful. Yeah, acco according to us, it's one? Or Yeah, p s Of c of course you have to be uh very positive and uh enthusiastic about your own product. Three. Uh, the remote control looks fancy. One? Good. Four. The remote control has big, clear channel switching buttons. Daniel. Uh, teletext buttons and volume buttons? False? And volume? True. Big and clear? Hey. Hey. Hide. It's it's not yeah, it J Five? Okay. Yeah, it's it's yeah. Red. Okay. Volume. The remote control is easy to be found. Oh, okay, but 'kay, look. If you put uh your normal uh remote control under your bed, or you throw this remote control under your bed, is it better findable? A li little bit maybe? Four? Fi I Ah, I I I think five. It's it's it doesn't really make a lot of Four? Yes, but five is between four and six. B\_. Yeah, it it's Yeah, yeah. But but the survey under users was that they uh really lost it. Like, no not uh not seeing it, but lost it in the house or something. But, okay. Yeah, okay. Yeah, I I agree, I agree. Okay. Eight, the remote control has fresh, fruity colours. Yeah, yeah, not too flashy. The remote control is made of soft material. Three? Easy to use? Top easy to use? It's it's not the most easy to use It can be easier. Jus just with ten buttons, that's the easiest. Yeah, but the most uh easy to use is just with one button on t Yeah, okay, but easy n not not the most easy to use, I think. Two? We also have to compare it to the uh to the remote controls on the market nowadays. So Yeah yeah, I'm uh hurrying. Okay, eleven. The remote control is innovative. A very of course. The remote control has m remova removable from Multilux. The remote control, i it has speech recognition. False. The remote control has built-in games? Yeah. And the last, paren parental advisory function. Yes, I do. Save as. Okay, I will uh do the the math. Now it's your turn. No. Advanced chip. Advanced chip is three. Three Euros, yep. Okay, one piece, yeah. No. Speech recognition, I think. No. No. Thingy. Yes, three. Eight. Okay, go on. Just go on. Two. Two. No. S Yeah, but but D but Daniel, tha that's that's another brand. That's another article to sell. That doesn't account for this. Producing this. No. Yeah. Yeah, of course. Yeah. Daniel. Daniel, what do you think about Here. What do you think about uh putting a battery in it, but also selling like uh the covers, a docking station just apart from the from the thing, so that you can uh put uh rechargeable batteries in it and just Yeah, yeah, okay. Just an idea. Yeah. Yeah, of course. Yeah. Yeah, Yeah. Hey, those ar arcs, why are there for? The blue blue uh Okay. No, no no. Yeah. But, wha 'Kay, look, what is

the uh If you make it double-curved, it costs one Euro more. But No, but does it have a lot of extra uh fun function more like Yeah. Yeah, uh aesthetic. I mean, uh you make like eleven and a half Euros profit instead of twelve and a half. But I don't know if twelve and a half is uh a fixed uh fixed price. No, we can't go above that. Yeah? Yeah, okay. Then it's okay. Yeah. Yeah, I think so. Yeah. What a what about all the m the environment freaks? Not freaks, the envi No. I I think it's it's It look like this one. Yeah. Yeah. This is it. Ah no, we have to do all those hours again. Go back. One back? Cos

ts on uh No redesign. Yeah. Yeah, okay, yeah. Hmm. I I didn't think so. That there was a lot of room for it. But, that's mainly because uh of the information that was delivered to us. It was just fixed information and get your stuff from there, and I couldn't go on on i on the internet and search my own stuff. Bu Yeah. Yeah. Yeah. Yeah, that's true. Leadership was uh crappy. Okay. No, leadership was uh Okay, I thought uh the first meeting was a little bit of unstructured meeting. Uh, you could have but uh, it was your first, no uh no disrespect or something, but you could have uh structure it a little bit more. So like, I I was talking most of the time the first meeting meeting, and Yeah. But About me. Yeah, you made up. No, it you did better. Yeah. Much more constructive. Two guys. Okay. Means. Digital pen, I thought uh th the first time I did individual work, I used it. But, a and the first two meetings I brought it with me, but I didn't use it at all after the first the first meeting. It's it's not real real use for me. Not really, no. Yeah, like when you do this. Smaller? Oh. Sorry. Okay. New ideas? Do you? Go on. Yeah. Mm, yeah, I think so. Did you heard what he said? I don't I don't know what I mean. Oh, I have some figure. Here. The eva the evaluation, the mm the mean uh number is uh one point eight one point eight six. So that's fairly uh fairly good, I think. Uh, that uh all the requirements uh are true or very true, right. Yep. Yeah. May maybe the idea you proposed is uh a screen here. And draw it, and it's it's placed over there. Hmm? No. Ah, very bad. But I think this is better than regular flip-overs, but Yeah. Yeah. Yeah. Yeah, but insert image isn't available? Here. Picture from scanner, clip-art. Hyperlink? Hey, what if you do like hyperlink? Type type it? Re Real Reaction dot N\_L\_. Yes, is now is okay. Okay? Huh. 'Kay, double-click it. You're erasing. Double-click it. Yeah. Yep. What I really miss also is uh is a d is a turtle is a decision uh decision system like um With the evaluation, you have to Polls like, what do you want, a one, a two, maybe a a l a little application like uh uh give your own number and click one two three four five six seven. Yeah, j ju ju yeah, v voting application. Just a little group group decision application. Yeah. Yeah, okay. Yeah, of course. But, uh you can still discuss about it, but but click it in an application, that's a lot easier to process. The digit. Yeah. Yeah. Yeah. Okay. That's it? Celebration. Yeah. Yeah. What is an end report? Yeah. Yeah, yeah. Oh, you ha you have ten minutes left, I uh read. You have now ten minutes left to finish up the end report. Yeah. Um You you already made a beta version, or Pages. Okay, Daniel. Do you want a chair maybe? Hey? Oh, okay. Five minutes for finishing. Management Expert, you have to change that. Marketing. Yeah, but you can save it u the under another name. Maybe um the The Yeah. You Yeah. No, you have to put uh, switch channels uh at the top, because that's the most used function and teletext at the second Oh nay, a volume changing, second. S switch, yes. Yeah. Okay, go on. Yes, very good. Yeah. Yeah. The order. Single-curves. No, okay. Was initial, the plan. The initial plan. No, it's it's not very cheap, but that no, but it's a development inside corporation. Like, uh w we don't have to buy parental control. Our own people can make that, I think. Yeah, it it has some cost, but Yeah. Real Reaction. Okay. Still the end conclusion. That's all, I think. Yeah, but but the the decisions are put in the uh conclusion, I think. Why we decided to use a flat uh L\_C\_D\_. Yeah. Um Save it. Hmm. Yeah, but then you had the same thing. Example of children remote. Oh wait. Wait. Hmm. That's a pity. You declare. Wouldn't wanna be Project Manager. Uh, what we going to do. Um, once again I'm uh gonna take minutes. So, um no

presentation for me. Uh, first we have a prototype presentation by G\_ and G\_. Afterwards some uh eval eval evalu evaluation

s sorry. Uh evaluation crit criteria. Uh, in combination with the finance I um uh I received uh a an uh an Excel uh file which we have to fill in later on. Um, you see. Uh, and then we must see uh if we uh stay under the twelve and a half Euro. So, that's uh that's a big I so let's uh wait it uh um we have we have must uh, we must have uh some time for that uh because it will be uh yeah, quite a lot of mathematics. And after that, uh uh an evaluation of uh the process how we uh how we have done it here with the SMARTboard, with the with our laptops, with the all uh all this. And uh afterwards, uh we closing. Once again, forty minutes, so uh let's start. I would g give the word to um G\_ and G\_ for the prototype presentation. J\_ and J\_. Mm. No, okay. It's called a weemote Weemote. Yeah, I can imagine that. Yeah, but uh you d you mustn't forget that uh our target aim is younger people. Uh, we had decided to uh put uh some flashy fruity colours in it, uh and uh in the survey from uh Milan and Paris uh it uh it came out that uh uh the d the older people are uh more willing to uh to spend money on extra features. So I think uh it will be a better idea to have some uh flashy fruity colours as as a standard, and for the people who uh really want uh a more sophisticated, more traditional look, they're willing to pay uh that. They want uh they want more luxury stuff, but they have the money to do it and they want to b to buy that. So, maybe it's an idea to put that as an extra and not as a standard. Yeah. Yeah. Yeah. Yeah. But, the mai I think th uh the standard must be some kind of uh uh attractive flashy colours. Not too, but w a little, because that's our aim. Yeah. Well, the buttons don't have to be uh all uh all of yeah. It Yeah. Okay. Thank you. The Marketing Expert. Sorry. Okay, so we gon we gonna evaluate the Yeah, the the thing we saw. Okay, just saw. Yeah. Seven? Uh, true. Sorry. Yeah, one I think. Yeah. Okay. Okay. Yeah. Yeah. Yep. Yes. No teletext buttons. Teletext is in the menu. Volume is true. Yeah, big and clear. Oh, okay. Well, I agree. I was thinking very black and white. Thank you J\_. Fruity. Yeah. Well, we p we can do it glow in the dark. So, if it's in the dark place, you still see it glowing. I think Ah, you must see it as uh, w uh according to uh the the other uh remote controls, there may uh uh be there in your uh T\_V\_ room, this one will stand out, I think. Exa I think that that's what it's about. If it if this lying on your couch, you're you're you think what's that for kinda orange uh thing. So Yeah. Okay. That's our remote control. True. Yeah, but not too soft we have decided. Three, yeah. Easy to use. One. Yeah, can it be zero? Yeah. Okay, two. Yeah, two. What's the time? We also have uh to do the evaluation, uh the production costs and uh stuff. Yeah. You're agree, Tim? You haven't seen a more innovative uh thing in uh Paris? False. Yeah, but they are built in, so it's one. Okay. Freak. Okay, thank you. We'll see. Mm. Okay, we have now to c uh to calculate the production cost. If it's under uh twelve and half Euro, then it's uh ok uh okay. But i is it if it is b Huh? No, this isn't right. Okay so,. Redesign. Oh yeah, if they under Yeah. No. Oh yeah. Yeah, it's sorry. Yeah, if the costs are under twelve and a half Euro, uh then we uh can uh ra uh move on to the project evaluation, as we have uh experienced it. Otherwise, we have uh do uh have to do a little uh redesign uh thingy. So Uh, we have to fill in the numbers of the component uh components. We have to uh fil uh, want to uh do it in and uh see uh if we stay under the twelve and a half Euro. So, do we have uh a hand dynamo? No. That's zero. Battery, one? Okay. Kinetic, one? Okay, solar cells, zero. Okay, uh simple chip on print? No? No, advanced chip. Sample sensor sample speaker? Three? Yeah uh, but it it's one one thing, it's three Euro. Uh, what's the sample sensor? Okay. Zero. Uh, uncurved flat. No. But is it s it's not made from a single uncurved

thingy and then uh and then uh no? Okay. So it's only uh once double-curved. Okay. We're now in a problem, 'cause uh we have uh reached eleven Euro yet. Okay, but uh we have Okay. Uh, rubber. You. Titanium, no? Special colour? Yeah, but we want to make uh the wood colours, uh that uh Yeah, one.

Yeah, but we we going to yeah yeah, that's true. But yeah, it's it's it Okay, the push-button, no. Scroll-wheel, no. No. Oh, no. Yes, one. Uh, button, no. No, the the we don't have a s no. Okay. Oh, okay. So, um what's the thing we can change? Uh, can I uh I say something? No, can I say something uh as Project Manager? The kinetic thing, can we just skip it, because uh you have to shake it, but that's not really innovative. Yeah. Yo. Sorry, yeah, yes. Yeah. Mm-hmm. Okay. Yeah, and not really. But we if you forget about the kinetic, well if we do that, we shall. So um Uh, b but i but the single-curved is just oh Oh, okay, okay. So that's wh tha that's one option. And then w yeah, and then we could have it, but uh it's its' well it's it's r it is the main point of the the the the look. No, tho uh that that can be done. So uh, okay, a little less uh conversation. Sorry? Fill in Just a explanation. I can delete it for you if you want. So, if we do this, uh we're on uh twelve and a half Euro. And we're done. Uh well, the only uh thing that don't Yeah, single-curved, but there's a curve in it. So Yeah, it's really a static value. Yeah. Yeah, it is. Oh. Yeah, okay. Yeah. Do you think? Well, now you can shake your remote control. Kinetic. Yeah? Who because if you want to go to kinetic, you're uh you're on thirteen and a half and you must go to flat, and I think now it's it's more of uh a compromise thing. And if you make the single curve ha just a big curve, then it's uh then it's uh yeah, one big good curve. I was going to uh say nasty words, but I don't. This is strange by the way. Wood is m is is is cheaper than rubber. We thought that wood would be more expensive. Yeah, maybe. But uh that this is this is it? Yeah. Okay, this is it. I'm gonna save it. Yeah. Okay, well, considering we have Well, we were above, so we did a little redesign Okay, um now uh it's about time to uh talk about uh this project. Uh, some uh things. Were there uh room for uh was there room for creativity in our meetings or in your individual meetings? Yeah. Yeah. Yeah, yeah, yeah. That's true. I agree with that. Yeah. That's true. Yeah. Yeah, that's true. Yeah. Okay. Uh how about the leadership? Okay, thank you very much. Now we're done. Yeah, that's true. Yeah. Yeah. Yeah. I notice it too. I was a I was also very uh unhappy, uh very unsatisfied uh about the about the first meeting. So, uh I hope uh uh the the the other meetings uh get better and uh I think the the last two meetings uh also we we reached uh some good decisions about uh talk yeah. Okay, so uh that's cool. Uh, teamwork? Well, maybe that's uh only Yeah well, it's for us, because uh Yeah. Yeah and it's wo more like presentation and some points were discussed. But, really teamwork were you two uh The Yeah? No hard feelings. Yeah. Now you you must push a little while. Okay. O Just uh okay. You can be you can go quicker, 'cause then it it won't notice it. I follow the Master class for the SMARTboard, so I think that's the that's the main issue. Um, so uh about this one you were uh you're dealing with, um the the the the digital pen. Okay. Yeah. Yeah. No. Huh. Well Yeah. M yeah. Yeah. And it is still your own handwriting uh popping up in uh Word. No, uh that's true. No. And uh the SMARTboard is uh useful, but the the pen is I uh not user-friendly, I think. Be it it takes a lot of time to draw things and to write things, and that's the Yeah, but that's not th the the you when you at a foreign audience, you b don't gonna wr uh write uh small. Yeah. But maybe there's some function with no, it isn't. With uh Yeah. Well, I'm gonna erase my uh name. Yeah, it's a big uh big eraser. Um Well, the the idea of the touch-s

creen is uh I'm just uh I don't know what what I mean. No. Oh. Oh yeah. That's interesting. Okay, because what does it mean? All the mo yeah, are between one and two. Yeah. Oh, okay. Yeah, okay. Thank you, expert. But the new ideas found for uh wi with working with this uh software? Not really, yeah? Yeah, I think Yeah. Yeah. You had expected it to to be uh more more uh Yeah. Yeah. Yeah. Yeah. Yep, yep. Yeah, that's true. Yeah, and and maybe some uh functions for uh uh uh circle or uh a square. You have to draw it yourself now. Yeah. Yeah. Yeah, that that can be done already. But not the the the predefined uh squares I think uh Hmm? Sorry? Well, that's nice. Is it Here. oh. Oh, sorry.

Select. Yeah. Here, that. So you have as you saw, you have a little uh Oh, you can Yeah, thank you. You can go uh there. So there the the the functionality is there, but it's not it's not ideal, and it's it's very it costs a lot of time to uh to use. And that's a pity, if you uh if you have uh thirty, forty minutes uh for this kind of things, and we are now with four people, but it well, imagine you are here you're with the ten people and everyone uh Yeah. Two minutes of drawing, yeah. Yeah. Yeah. Yeah yeah. Yeah, just like he said with the with the a screen which you can write, also uh a kind of voting uh mechanism. Yeah. Yeah. Yeah. Okay, so Uh well, just about, because uh Yeah, tomorrow? Uh, the costs are within the budget. Uh, the project is evaluated. But, before we going to celebrate, uh I have uh a little question which you can't answer, because uh there must be some kind of end report. I am busy with the end report right now. You might thinking what the hell was he doing uh Uh about all the meetings, what we have decided, a r r a report of this day. Uh, that must be made, but I don't know, here is uh standing uh whoa, we can celebrate now, but the end report is Okay well, that uh that can be done. Maybe we can do it uh together. You can see what I've uh yeah? So I I s I will uh put it on a story-board. You can see it. Because I think it will uh it must be uh Yeah, it's a three uh with seventy five uh Yeah, just about. Well, just a moment. End report. No no no, I'm just uh you can s you can read it and uh here here it is. End report. Well, this not nit it read-only. But it's not uh fully finished yet. Um, this is about the functional design, the things yeah yeah. Oh yeah. I'm uh when I said it, I remember I had it here. Marketing Expert, okay. Um about the three functions where uh which are most used and uh which must uh immediately be visible on our uh remote control. Um, it must be uh simple to use, very clear what to do, and at the younger people. So, this is really about wh uh what kind things uh must be in it and uh yeah. Yeah, I understand you, I can talk a little bit Dutch. Oka okay, okay, I I really didn't knew that. So, this one's first. You go there and you go there. So, okay. Well, maybe I can then do it one two three. If the order is in uh is is uh important, that's the word for. Uh, then the conceptual design. Uh, well all the things we have uh discussed, uh the energy, which uh turn out to be uh batteries, so that's Yeah, because yeah. Uh, he here it is still double-curve, the rubber, the flashy, the fruity, the removable. Uh, the buttons Hmm? Not double anymore. Nay but that this is what um Yeah. And the the added functions like Tetris snake, it's under the parental control, the touch-screen. So, it's uh just a summary of what uh we had discussed uh Uh, it's very cheap, you you maybe you you you you come at uh It's very necessary. Yeah, but it still has some yeah. Okay, but so we can discuss that uh we can discuss that kind of things I think with the with the the board of uh What's it what's the company called? I just keep forgetting it. Real Real Reaction. Real Reaction, yeah. Okay, so uh anybody uh misses something here about uh Yeah, okay, that's that's what I'm gonna write b between now. But, i in here nothing uh Mm-

hmm. Yes. Yeah, touch-screen I've mentioned. Yeah, okay, well I gonna redesign uh something now. No. Because I think it will Oh, five minutes from to finish meeting. Oh, that's cool, Tim. Finish meeting now. Well, I'm I'm I'm going to finish my end report. I am the one who can say that. Yeah? Hereby the meeting is finished. Yeah. Yo. Evaluation criteria. Oops. Some creative uh Oh. Yeah. Ok okay. Shall I give a short introduction and then uh Okay. J\_ and J\_, okay. Take it away. Um, this was our first concept. We decided to use a single touch-screen. So, we've worked out this concepts, how to how to hold it, where to put the buttons and and stuff. And um, well, we began with uh with a form of shape, that is uh is easy to hold w in one hand, left or right handed. So, we made i it a little bit less thick and uh it has some ar artistic meaning. No? This uh isn't nothing. Idea maybe uh is better. Um well, during the meeting I showed you the concept of uh placing the buttons on top, usable with your thumb, and uh the menu structure, uh if necessary, with your other hand, so it's just gonna hold it easily. And it has to be

acce accessible with your uh other hand too, of course. So we began uh working out a concept. Yeah, the panel just uh of course goes like this. But the overlaying layer is uh a little bit uh curved and stuff. Yeah. Yeah. Oh, we added that this um can be held with your hands for this maximum is om yeah, one and a half centimetres. So, you have room here for your battery and maybe even other um electronic chips. S and you can just be the the layer of the touchscreen and some have some wires underneath it to make it as uh thin as possible in the middle for good grip. Yeah. Yeah. Yeah. Yeah. It would be best to to appeal to a broad public and make the covers exchangeable, so the young people will buy an orange and a red and blue and a purple, but when the o older people uh go in the shop and they see uh an orange um remote control, it would be less appealing than a white one. And young people, we think, are a little bit more flexible, they think, ah I'll buy for a couple of Euros some noi nice hip uh Well, um I think a cover is necessary, 'cause als otherwise you'll just have the L\_C\_D\_ screen. So, there must be some cheap standard cover, um maybe white or something, that's could comes with it and you can buy, so we can make extra money. Okay. The other way around, you mean. Uh-huh. Mm-hmm. Okay. Okay, yeah. Well yeah, a colour of a wood style, a white c and uh a couple of h hip uh fruity colours. And lea uh I delivered standard with a fruity colour, but not too not too much. This is banana and mango, not not purple or p orange and yellow. Ah. Mm-hmm. Yeah. Yeah, okay. No. Yeah. Okay. Okay. It's my turn. Mm. Yeah. No no, a little more in the middle. No, uh three or yeah. Yeah, it will be primary appealing to to m minus forty, but also appealing to Yeah. It's Wow. Yeah, it's the marketing uh angle on television. We have a wonderful Yeah. Well, it's also fancy then. Yeah. Of course. We have a perfect remote. Yes. Yeah yeah, oh they have to agree but I'm the User Interface uh Expert. Um, uh no. You you've different menu. And volume is impo yeah. Yeah yeah, big and clear. But you could make a teletext button uh six. Otherwise, the people who read this uh are gonna think we have no teletext button. No. Yeah. Black and red. Okay, don't forget to save it. Uh Uh well, when we put in fancy colours, yeah and Yeah. But, um it it's not making any sound uh, have we deciding? So It'll make a difference. We have the better re I don't know. Yeah, I think so. My remote control's black. A little bit, but yeah. Uh K yeah. Fo fo yeah fo five is. Yeah, okay, you're right. Yeah. Yeah. Yeah. Yeah. If your uh fifteen remotes in a drawer, uh you find it, yeah? Yeah, that's stupid. Uh, but when you lost it you're just not Yeah, mostly when you lose your remote control, it it's under your Most of times when you lose it you're sitting on it. Uh Um

I would call uh choose two, 'cause we decided not to make two f uh fresh colours, as it would not. Um, kinda soft, but but not this. Yeah. Yeah. Yeah yeah, easy to use, very afford. No, you can do two, because um it can be easier. But then you're I yeah, but then you'll lose function f yeah, functionality and our fancy uh look, so. But It is r it is rather easy to use, because you have the primary buttons always visible. No. Yeah, m mine too. Yeah, but waits just a minutes. Inspiration. These are the m regular remotes. Yes, true, one. Yes, one. Very multifunctional. No. This is used with speech recognition, this. Yes. But uh, maybe make it two, because the games are in a sub-menu and not uh it's not an entire game. Yeah, okay. Yes. Th did you make this or the Yeah, It changes it maybe. Oh yay. Oh dear. Hmm? If they're under twelve fifty. Yeah? Cau 'cause so it's okay. Battery, yes. One. One, yeah. Kinetic, one. Yeah. No. No, the advanced chip is uh Yeah. Yeah, you give it a sample, uh one. No. You no. Yeah, 'cause um the layer around it fits around the bubbles on the o on the uh the back of the Uh, we don't have anything else. So Could you step a little to the right ma Yeah. Oh, sorry. Or And zero. Special uh is the special colour? Mm. Yeah. Yeah, if if you're honest, we'll uh type one, special colour. Yeah. Uh, j maybe we'll finish uh the the list first and then look back, aye? No. Scroll wheel, no. No. One, yeah. No. Mm, is it No. No. So No. No. Mm, single-curves. Yeah. Just cut off the kine yeah. Or yeah. Yeah, we just put a good battery it it. Mobile phones nowadays. But you can use rechargeable

batteries anyway, just you s you have to recharge them manual. Yeah, that's a cost reduc Ah. Yeah, so we have to bake the ba back flat, and then No, it's it's just one curve and not a back uh curved I think. Or Or are these two curves? Uh Yeah, but what else uh do we have to cut out? No advanced chip, uh that's a little bit of problem. Although, can we make it with a regular chip? Curvy. Explanation. Twelve fifty. Well Yeah, but does it fit with our design? Do we have to u adapt it? It's single-curves. W Could we just make the bubbles uh cut off the back, and then we're uh has Okay. More. Yeah. You make it optional. Functional. Uh, there's an a a athe aesthetic value, but not functionality. Yeah. Yeah. Yeah. Yeah, but it doesn't fit in our co cost profile. So You ma can make an an specialised extra gold version. Yeah. Yeah, just one big curve. Uh, this uh American figures. You just cut down some trees. Whoever makes uh a remote control out of titanium. Yes. No. We sue. We Yeah, we'll start her all o all over again. Um For us, there was a lot of creativity. We could just sign up an uh remote if we liked. Uh Crappy. Cra Yeah. Yeah, example of crappy leadershi Okay, yeah. You could of said, shut up you fool. Yeah, more more consensus. Ev everybody w was agreeing every Yeah. Well, we work together on a project, but everybody has his own task. So, it is a little bit Yeah. No Well, it went okay. Stupid stupid pen, but uh Yeah, but but draw something uh difficult. D uh just write your name right now. Try to write your name, in in writing letters, of course, yeah? Yeah, normally, uh this uh the w Block letter sign it, yeah? Just just write your name in in one line. If it's a little bit too small bit quicker now. It didn't Uh he he knows how it works, yeah. Y well, yeah. Th the i The idea is great, but it doesn't work properly. Uh Yeah. Nee. As uh as I said a m a c few moments ago, it I would like, myself, to write with a normal pen, because must um Yeah, it's almost the same concept, but you can just sim more simply put it on our scanner. I it's the same concept as the pen, where you f have to download the software or s uh very uh slow. Yes. No, and it doesn't give any added value. Yeah, not user-friendly. Yeah, and it's it's not very precise. We're trying to m to Yeah, it may um Yeah, and tr try to wri write your name uh in a in a norma

I uh size, yeah. Smaller. Yeah, smaller. Just like when you're writing on a letter. No, a as you saw on on this drawing, just open open this one or that one. It's uh th it it Yeah, uh we had more problems even here when we trying to draw these buttons, it's almost impossible to get clear uh when you're uh And the eraser was another problem. It w t is is this large. And when you try to erase this line, y I'm gonna erase my name there. M Abo What kind of new ideas? Yeah, uh New ideas about uh the working of this software, about about the project, about the remote controls or Hello. Yeah. So true. Not really, just they have to improve it. Uh, the concept is okay, but it has to be quicker. Uh, it is still opening my programme, n almo almost uh my entire computer is locked up during the process and it, yeah, just takes too many time. People will still feel the need to to write it quickly on uh a page and not download it and save it, and More user-friendly. 'Cause when you use a pen, you can just draw like you d draw normally, and you do Yeah. Yeah, that I Would be easier. Or at least when you you don't have to adapt to the technology, just you can write in the way you normally write. And now you have to um keep constantly in mind that you're drawing on this screen. And that's a very bad concept. Nah, okay, I I it's my opinion that I Yeah, it's can be saved easier. But if you're in normal flip-over you a lot of people write text. There's no text option. And writing text uh, yeah, you've gotta really do your best to write some Yeah. Or maybe even insert picture. If you have uh some presentation, and you have some f Yeah. 'Cause then you could Oh, okay. So you can With uh W\_W\_ dot Google dot com. Oh yeah. Maybe. You'll just make a link in Yeah. There's one way to uh Maybe if if you're not using the eraser Something else th Yeah, arrow. Okay. Well, it's Yeah, okay. But. To use, yeah. Yeah. And that's m That's mostly the case, from the over here with the managements you get two minutes to make your case, and if you have to do all this kind You'll rather use PowerPoint and work it out in advance. And th the one or two

things you have to draw when you're there, just use a flip-board. Yeah. Okay. Yo, manager. When are w When are we going to produce it? Oh. A chairman. Yes. It's a read-only version. Oh, okay. Uh One two three. Yeah. Well, okay, maybe you can add it later that we decided in the end because of the cost. A single-curved. Ah, it's very cheap. Yeah. He'll do it in his free time. So uh Of directur or directors. Yeah. You can ask your personal Yeah, the end conclusion. But uh Um, the decision to make um the buttons on the top, and the menu on the on the bottom. And clearly Yeah, touch-screen you've mentioned. Okay. Okay, this n yeah. Party party. Oh, before you change anything maybe you um save it first. You can't you can select file and export and then those J\_ PEG files. Well, eight. And we have uh, another blank one. Did we change anything? Wow. Yeah. It's a new uh commercial logo. Don't save it, aye? Uh, why are only the first five SMARTboard files saved?

---

# Meeting ID: 115

Data Source: Train

## Executive Summary

The User Interface Designer presented the prototype of the product to the group. The product featured an LCD display, a flip panel, and a customizable case back. The Project Manager displayed the cost of all of the components, and the group decided that the current budget would not allow the addition of the LCD display. The Project Manager decided to negotiate the cost of production to allow the addition of the display. The Marketing Expert gave a presentation on sales projection and showed that the current projected sales point would probably not allow the project to reach its profit aim. The group also discussed the distribution and promotion of the product on the internet. The User Interface Designer expressed concern that there would not be time under the current plan to make changes to the product resulting from consumer testing; the Project Manager decided that no additional changes would be made. The group then discussed other means of promoting the product: launching the remote at the same time as a large sporting event or DVD release.

## Complete Meeting Transcript

Yeah. Thanks. Mm, okay. I've done a presentation, but it pretty much covers work that we've both done, so if I'm missing anything, Christine can just correct me. It's not the biggest PowerPoint presentation in the world, but Three. Um. No it's think it's the last one. No, then this is the la yeah, that one, final design. It is named appropriately, you just couldn't see the name. Um okay, can I have the mouse? Thanks. Alright, so from when we were discussing specifying the case in the last meeting, we decided that we wanted an ergonomic shape, the material that we chose was wood, and uh the colour would be customisable, 'cause you can stain the wood whatever colour. Um, so in terms of function, you have to be able to turn the T\_V\_ on and off, volume and channel control, menu control, voice recognition control, and we've incorporated the L\_C\_D\_ screen on the flip panel as part of the design, if we figure out it's too expensive, well then you just take it off. Um, so to unveil our lovely product. This is our remote control, with the flip panel as you can see. So if you lift up the panel, you can see the lovely yellow L\_C\_D\_ display. Um, this is actually hard to do. The yellow button you have is the on off button, so it's really big, hard to miss. You have the the red um triangles are the toggles for changing the

volume. So up volume up, down volume down. The green are the channel changing. S And it's one of those very light, very touchable displays. And then you have the numeric pad in the dark blue at the bottom, and on the right-hand side you have the access to the menu on the T\_V\_, and on the left-hand side you have the the the ability to turn off the voice recognition. So this is pretty much what we had on the white board the last time. So. Oh yes. Additional feature on the back is that you can have your own customised backing and I suppose you could do the same thing on the flip case on the front. So that you can really make this a highly highly customisable remote control. Yeah. But it shouldn't be under the flip either, because you can have the remote control closed, but you still might want to activate it by voice. But if you've already got the remote control in your hand you need to open the flip to use the voice, why use the voice, why not just use your hand? I mean the whole point of the voice is that if the remote control is sitting there and I'm too lazy to reach over and pick it up, I can just use my voice. Yeah. And you don't wanna let go of either one. I mean it doesn't have to be on the flip, it can be on the side somewhere. Yeah. So, I mean I can pass this around if anyone wants to Yeah. Yeah, exactly. Yes. And maybe the shape of the buttons, the little egg shapes aren't the most economical, but Yeah. I mean this is plasticene. There's only so much you can do. We could have possibly made it a lot thinner as well. But And part of the thing is m a lot of people say that they don't like something that's too light, because they don't feel like they have enough control over it. So I mean maybe this is excessively heavy, but I think it needs to have some weight, it needs to feel like you're still holding something. So that's pretty much it for our presentation actually. Yeah. No we do, but it's not filled in. It's number thirty. Oh, yeah, yeah, you're right, sorry, yes. Um-hmm. Yes. That's no, I think it's the same one. Functional. It looks like it, there's S Yeah. Um-hmm. Mm. I was thinking the same thing, yeah. Directly. Um-hmm. Yeah. Yeah. You can do a shipping centre somewhere, or strategically place shipping centres to minimise distance costs. Yeah. That actually makes more sense if we're gonna make it so highly customisable, 'cause on the web people can look at the different options they have, see maybe what other people have done, what the range of possibility as, whereas if you're in a store, you can't unless you're a highly imaginative person, you may not really know what it is you want, whereas on the web, i f you have a bunch of pictures, it can sort of trigger ideas and Yeah. The weight and feel. Yeah. Yeah. Yeah. Mm-hmm. Yes. Mm-hmm. What turnaround time do we have? 'Cause I mean production evaluation can be very very quick or very very long. Yeah. Mm-hmm. Think minimum two weeks if we're gonna develop prototypes and then try to take them to different places and see how people use it's not a trivial task. No no. We definitely shouldn't do it in our factory. What ab Well I was just wondering about if we're gonna do a product evaluation then what about time for redesign if the users come back and tell us no this is bad, this is bad, we want this done differently. The problem is there might not be a second generation if the first generation flops for some silly reason that we haven't thought of. No, but there's a difference between releasing a product that has been minimally tested and fine-tuned to suit a general range of requirements versus releasing a product that we think will work but we don't really have anything to back it up. Yes, but I'm not everybody. I mean the whole point of user evaluation is to see what real people need. We have our own motivations in mind, we have our own ideas in mind, but that doesn't mean that that's what's gonna sell. Yeah, of course. I'm just trying to point out that I think that your evaluation and redesign turnaround time is too short well you have no redesign not you personally, but in the project we have no redesign time and Yeah. Yeah, that's a good idea. Yeah. Mm-hmm. That's actually good place to advertise it too. Yeah. Mm-hmm. It's just something to keep in mind, 'cause it's really really important. A lot of products have gone out there without being properly user-tested and completely flopped, when in fact it gets re-released a few years down the line with proper testing and it

takes off like crazy. Really? That I didn't know. Mm-hmm. Yeah. Yeah. Yep. Exactly. Okay. Thanks. Bye. Welcome back. Welcome back everybody. So this meeting agenda will be the detailed design meeting. And uh opening and uh P\_M\_s of the meet minutes, uh prototype presentation from uh Christine and uh Agnes. Yes and uh evaluation criteria. The finance, it's uh from my side, from the management, and uh production evaluation. Then uh closing. So we have forty minutes to discuss and uh finalise and close the product and project and to move further, okay, so Okay, let's talk about uh maybe first uh for the prototype. So I handle to So shall I go to sorry. Yep. S Okay, let's go to A\_M\_I\_. So in two or three or Yeah. Yes. Mm-hmm. I think the microphone is on on the top, uh on the middle, the under the flip. So that will be the safe, so p any the chip it's not on the chip because you need to have microphone to Yes. Uh it's it's Yeah, but uh uh my opinion I think it's better under the flip because whenever you want to uh the talk, okay, so then you can speak then you can close it. But if you put it on the on the flip, okay, then uh technical I don't think it's uh feasible, 'cause most of the time you speak then it will be recognised. Yeah, the sides maybe is good. So That's good idea. Yes. So it's maybe good idea. Yes. Yeah. So it's maybe good idea. S s Okay. S I'm fine, I'm satisfi I'm satisfied. Of course it's it's it's looks more heo heavy, but I think when it's completely maybe it's a less weight. Yes. Yep. That's your uh prototype model? Okay, that's good, thank you very much. So any comments or uh Okay. Yes, that uh So I'll come back to the So evaluation criteria, I think uh that will be good, so then let's come to the finance uh, I have some uh calculations which I made uh as for uh the budget. So here you can uh look like uh the energy and uh dynamo and uh kinetic and solar cells. Uh it's optional, somewhat optional and Ed wants the chip on print, that's what uh we were talking about that. So then we have sample sensor and sample speaker, then uh we have the wood material, then special colour and push button. S

o it's uh actually, our budget was uh twelve point five Euro, but uh it's coming to nine point nine five Euro, so we are under uh below the budget, okay, so still we are saving some money. I think it's a good figure. Than thank you. So maybe it's for some money we can utilise for our uh marketing, for the sales, okay, and uh It's not. Yeah. Yeah. Yeah. Yeah. Yes, so still uh we have twelve point five Euro. Yes. Yeah, but Yes. Yep. Yes. This we are talking about one unit, okay, so when it go into the quantity, okay, and the cost will come down. Yeah. Yep. Yeah. But anyhow, still we are under control, okay, so what uh I will do is I will try to negotiate with the vendors, okay, to get uh the production cost less, okay, so then we can save some money, okay, to put into th our marketing or uh you know the promotions, whatever, okay, so that uh I will look after. I will speak to the management and how to get uh you know some more uh cost down. Yes. You're in four? TrendWatch. Okay. Yep. Mm-hmm. Yes. Mm-hmm. Yep. Yes. Yep. Of course. Yep. Yep. Yes. Yes. To the agents. Yes. Or eBay, or Yes. Yeah, that's a good idea. To impro more profit and uh Yeah, yes. Yeah. We can. I don't think that's uh not possible, it's uh okay then, I uh let's wait for the production, okay, then uh you can evaluate the product, so how it looks like technically and uh how it look like uh the real. T Oh but Yes it's it's very quick, of course. It will uh come back in two weeks, okay, it will be ready in two weeks. For evaluation, okay. Yes, the prototype uh prototype product evaluation. Yes. Yes. Yes. Yeah. So you can take a minimum two weeks to a maximum four weeks. Yeah. Yeah, because we we are not going to do it in uh our factory, okay, so we can give it a product evalua Yes, yes. So we'll do it in the other place, and I don't think it's take more than four weeks time. Or uh Okay, so then the real production we will start once we product evaluation, okay, then uh it's approve from uh the technical team and uh your team, okay, uh from the management, then we can launch in the market. Hm? S Any any other uh questions or uh comments to be discuss? Okay, so then uh Okay uh, let's take like this. Let's proceed with this model, okay, for the

for the marketing direction, okay. So no more changes will be made, okay, in this the basic design. Okay? So we will introduce m this model and uh let's introduce in the market and let's take the feedback from the customers, then we can uh go for the second generation. Okay. There's no end, there's not limit. Every every custom Okay. Well, every customer, okay, they have their own ideas, they have their own test, okay, so there's no end, there's no limit. Yeah, so that's the reason you are here for uh the design, okay, I hope you made a good design. Yeah, but uh see, we ought to take a few considerations, okay, one is the price consideration, one is future consideration, okay, like uh you can eat uh you can all eat more chi I can eat more chilli, okay, so i it's a depends on the individual taste, you know, so we have we have to balance somewhere. Yes. Yeah. The sports time. Football. Football. Yes. Yes. Yes. Research. Yep. Yes. Yes, the that of course uh I will convince the management to do that, okay. Sure, sure, yes.. Yeah. That's the reason Ed is here. I think he can promote the the brand value and the product value. Yes. We are behind the scene and he is the front screen, so. He's on the big screen. Okay, so then uh let's come to the closing and uh are the costs within the budget and uh is the product evaluated, okay, so that will uh come soon. Okay for uh but our time being, so thanks for all your efforts and great work and uh great design and uh let's leave it to the Ed for later for once production is over and the meantime let's celebrate. So let's meet up uh this evening to hang up for some party. 'S good. Thank you. Thank you again for all. And see you in the evening for drinks. Probably. Technical pa I would think. H

a. I don't wanna say. Louder. Yeah. Can also be on the side. No, because y you can easily put a microphone on the side that would have no problem would haven't been not be damaged or anything, and it'd be accessible all the time to voice. Yeah. Compliments to the artist. Uh. Well, the prototype is is very well within the design and ideas that we've we've talked about on the previous meetings. Now it goes into this next phase as the financial uh marketing uh Well we haven't come to mine yet, so we're gonna have a bit of difference of opinion, yes. Well, it just depends on if we're gonna add a o on this pr provisionary cost analysis, we do not have a L\_C\_ display. L\_C\_ display is gonna be very expensive, it's gonna be It's not it doesn't say. We don't have the price up there, okay, so if we add approximately two to three Euro per remote, now we're up around about twelve, twelve and a half as to what uh the company had initially uh requested. Um Display in. But as far as production um I'm putting up a question because we're talking about profit also, and in mine you'll see uh the problem with uh our survey, the p the possibility that how many units can be sold, what percentage of the market, etcetera etcetera because that has to be taken in into consideration. Uh this is just production cost, it is not uh advertising cost, it's not transportation cost uh And that will inflate quite a bit the cost of the uh the cost of the unit for the company. So to come up with what the company wants is a fifty million Pound profit, we're gonna have to go a long ways. Yes. Slightly. It's gonna be very hard to reduce. That's not bad. If we can go to to my display. And we'll come back to yours just to give everybody an idea of the market. So now I'm gonna scare everybody out of this project. If I'm still here. Yep. The four gives me it's gotta be uh TrendWatch. No. It shouldn't be if it's not it's not the right one. No, no we g no, that's the same one. You have to go back and find another one. Whatever name it popped up under. Uh functional, try functional, it might not be it either, but we'll see. Yep, that's it. So we'll go screen by screen. Although since uh we need to have some type of idea on a market uh we had independent study that says it this this market has an availability to absorb eight mi eight million units per year. Okay? Our internal company evaluation puts it between eight to nine million which is approximately the same as the independent study. So if we continue, we'll look at the findings. Next screen. Which means that uh if we have a target of two million would the company has to take twenty five percent of the market in the first

year, which is actually a tremendous amount. No kidding, yeah. So, if we put an inflated price of fifty Euro at a production cost that cannot exceed twenty-five Euro, okay, we're already in that that price, okay, with transport, promotion, labour, because we have included the promotion in the cost, transport for the material to the stores or whatever how however we're gonna break this down between our our retailers. Twenty-five percent of the market to get to two million units. At two million units, we have to have a profit of twenty-five Euro per unit to get to the fifty million unit Euro profit. Okay? So, obviously we will just did a run down the evaluation of the form, the fan uh the fancy stylishness of the of the unit, the ease of use, speech recognition, cost, we've gone through these. Now, the company must evaluate the feasibility of being able to take enough of the market to justify in production. Or we project this over two years, but being that the market changes very very quickly, maybe there's no more interest in buying this thing in eighteen months from now. So, now we have to come up with a decision. Can the company sell two million units? Can it sell it for fifty Euros? S Upscale technology. Well. There are several companies that have gone that way. Weight, the feel of the product

, but There are several that have gone through with the watches, too. You can customise a watch, you can see how it is at the end of the production, you can change it uh There's a lot of online that's that is doing this now. And when you're rotating, you'll look behind and look this way uh it's possible to do with this, maybe there's a possibility of selling more than two million units in one year, which could you know, feasibility uh lower the price of the unit. Well, obviously. Mm that'd have to be thrown out on the market for people to get an idea, to see get get their I think we pretty much covered everything. Well, then it may not be. Like people don't like wood. very specific. Hmm. Right before the Euro the World Cup. World soccer. World Cup soccer, they need those things that they have their hands occupied and they need to be able to talk to the con remote control. Or any major sports. Yeah, I'm the one who takes the heat. If it's a flop, it's the marketer. Yes. Yes. Stress. Celebration. Very good. Thank you very much. Bye-bye. Yep, okay, see you later on. I'm sorry to be late. Agnes, yes. Uh thank you, so you did a PowerPoint presentation, good for you. Um and uh I could Yeah the design We haven't um uh specified where the speaker or the microphone will be placed. That depends on the uh s design of the circuit board inside and uh what room is left um Yes, okay. Uh-huh. No, I mean it depends on the design of the circuit board. Maybe I've got my hand in the popcorn bowl and I'm holding my cup of Coca-Cola in the other hand. Mm-hmm. Yeah, y better you pass it around with a napkin. It's um It's um You need to work on the weight a little bit. We're glad you're satisfied. Mm-hmm. Yes, great I I'm surprised. Congratulations. Oh, okay. It's gonna cost a long way to c you know, cost a lot of money to market it, is it? Thirty. Yeah. So that means we can put the uh the L\_C\_D\_ in, yeah. Although customisation, because this is being done, you know, the on on-order basis, it might be uh the the quantity won't m won't uh the circuit board will b you're right, would be in producing quantity, but the cost of the case would uh be fixed at the Uh you got some pretty cheap labour that can do this case for one Euro. That's really that's the cost of the material and lab wow, that's really outstanding. Is this the same one you did before? Okay. Yeah, no kidding. Maybe maybe they already expected something. Could could I go to findings? Uh uh um I would uh like to explore the possibility of using um alternative um delivery and sales channel which would be um to use the internet for promotion and ordering and then to drop-ship the p product to the customer's residence. That way you have no storage, you have no um you do have transportation, still have the labour cost, but you don't have the transport to the uh point of sale. The point of sale is online. Right, like Amazon. In fact, we should sell through Amazon, don't you think? Or eBay, yeah. There's an idea. Going with um Ah, we we're do you know, selling a unique product uh. Mm. Mm. Mm-hmm. And you can even have an a movie that you can rotate the

object and look at the di the only thing that you're missing really is the weight. Mm. We're getting used to that. It's not quite like trying on a shoe, but people are getting used to buying things online that they can't touch before buying. Uh-huh. Great. Works for me. Prototypes, you mean. In um We probably should do some market tests uh once we have the prototypes and do some orders and things like that and test-market it. Any outstanding? No, I'm go ahead. Did you have something? Second generation. Our project doesn't um Ed, d do you know what season of the year or time of the year is the most important for T\_V\_ remote control sales? Would it be the Christmas season by any chance? Sports season. Which sport season? So so maybe what So I think what we need to do is perhaps to synchronise the final the the launch of a user-tested de

vice with some special event. And and then um so that gives us a little more time perhaps then we anticipated, because I don't know when the World Cup is, but I'm sure there's gonna be one. Or another m major sports event. Probably not the um the football games coming up the end of January. I think that might be a little too aggressive um, but, so, I'm just ig uh pointing out a uh a strategy to uh do some additional user testing pri and then to launch um at a a major sports event or uh perhaps to uh also And to work with motion pictures. There might be some motion pictures that are coming out um that are coming out on D\_V\_D\_ that uh they need to have a m special remote control to work with it, so we could maybe work out a campaign with uh with Sony Pictures for example. Maybe some management has got uh relationships there we can leverage. That's great. Disposable diapers is an example of that in fact. Yes, it is one of the first consumer products that was launched about thirty years that was a disposable consumer product, and uh people the market hadn't really gotten on to the concept that you could use something and then throw it away, 'cause it wasn't uh but then when they re-launched them thirty years later, they were virtually the same design, but people had gotten the throw-away, you know, paper cups and napki y all kinds of things that they hadn't um so, you're right, timing is very important, but I think we've got a good product. That's right. It's gonna be very important to the company. Good luck, Ed. You look very relaxed, considering h you know, the uh the weight on your shoulders, yeah. Sounds good. Thank you. Nice working with you.

Data Source: Train

## Executive Summary

So welcome back . first . I want to say I'm the secretary , I wanna hear from you , what you've done . And after that I have some new product requirements . So And after that we have to make decisions , what we will do . We have forty minutes for this meeting . After that we'll have lunch . So first I wanna ask the Industrial Designer to tell what he did . So Where have I put it ? I've save it on my computer , my presentation . But now I don't know where it is . Okay here it is . It's a little difficult what I'm gonna tell you . It's about the working of the remote control . I just had an half an hour j to study it and I don't get it . First uh I will tell you something about the findings , what I discovered about the remote control . Uh then I'll have uh some kind of map , and it's the top of the remote control . The remote control is a very difficult uh thing to uh to explain to just all of you wh who haven't seen a remote control uh inside . Uh there's a lot of uh plastic on it , um because its uh not so expensive . And there are uh a lot of uh wires , uh which um connect the components in it , and there are um switches and things like that . There's a lot of small uh electronics . So it won't be um uh too expensive to build it . Only twelve Euro fifty I think uh we will make it . And here I have the top of the remote control . Uh here's some kind of chip . Uh on top of this , there are uh the numbers . Uh you have all on your remote control . And uh the teletext uh button . And uh here's the battery . And when you push the button , it will uh will be sent to the chip . And the chip will um send it to all kind of sub-components . My preferences ? We shouldn't make it too big . Uh also for the cost , uh we should only put one battery on it . A long-lasting battery . Uh also for the cost , uh use only plastic . Also because of the cost , uh not too much buttons on it . We can also make uh a button uh with a menu uh button . And then um that that you will see it on the T\_V\_ . And the bleep signal , y uh you told us . Uh but we can also use it uh a bleep like something , when the battery's empty , then there is a bleep . And also the bleep , when what I told you about uh when you lost it , and you push a button , and then you hear bleep bleep , and we will find it . The battery . If we w if we use only just one uh small pen-light , then it will be cheaper than when we use two . when you use two , you can use it two times longer . then we'll have to make the um remote control uh long lasting . Okay and the buttons . When you use it on the television , you've you need the television , wh which can use it . But uh I think this our remote control is for the televisions we uh we sell in our company ? Or is it also for other company uh for other televisions ? I think we have to use it also on other televisions though . Maybe just a menu button to use it on our televisions . They are two different things though . We have to

choose one . It has to work on o uh all televisions . Then I think uh the menu button uh will only work on the newer televisions . And I just uh have one more idea . But Uh , to have a trendy remote control , we can also um make something like the Nokia um mobile phones . To change covers . So if you have uh a trendy half with all red , uh yellow and something . And then you can put a red cover on it . Will this will this add to the cost ? Uh then it won't be uh will have just one cover on the uh original one . And then you can buy the covers . but you have to m uh be able to change it . D does it make it more difficult to design ? I think it will be a little more difficult , but not too much . Just like with the Nokia uh mobile phones . Yeah but there are much more Nokia telephones than um these ones . If it won't works then we'll get something else . Then we uh won't g uh go further with it . Yeah but are their profits bigger than their cost ? Uh a p a a cover made in uh in China , it it won't be I guess so expensive I think . Yeah but there are also design cost . Would you change the cover ? I wi I won't . But maybe I think trendy people or like children where you can paint on it , I think that too less people would change it for good profit . So I'm not sure if it will make profit enough to uh But it's uh yeah it's uh original idea . but I don't think we have to do it . Yes well uh uh I shall give a short talk about the the technical function design . Um I thought the the the technical function design was uh to uh for a remote control to to to have some influence on the T\_V\_ set . And uh well , it all by pushing a button on the remote . Uh I find some uh some interesting quotes on the web . Uh message to the television . And uh and and and well basic uh operations like on and off , and uh switching channels , and uh and maybe uh teletext or something like that . well these are two uh remotes , and that's our uh our dilemma I think . Uh But uh shall we make a basic remote control , uh just uh swapping channels and volume and uh power button and well nothing much more . Um any ideas about that ? Basic or multifunctional ? We'll got back on that later . So uh I didn't know what uh what way we would go . Then it's your turn , the marketing expert . So I'm uh gonna have a presentation about um the market , Uh we did a usability lab-test with a hundred persons . uh what frustrations they had while using remote controls . Uh our users , they disliked the look and feel of current remote controls . Um uh they especially found found them very ugly . And um th they also found them hard to to learn how to use it . Uh well they also zap a lot . And uh fifty percent of the users only use ten percent of the buttons . So a lot of unused buttons . Well uh the most used button is the channel selection . The power , volume and channel selections are very relevant . Uh teletext is uh less relevant but also important . Uh not important they found the audio , uh that's not the volume but uh specific the the pitch , or the left or right . Uh the screen and the brightness . And uh channel settings . Uh th and they also are not used very often . Uh here we can see what the market share is of uh several groups . Then we have a few um graphs about the market . Um as you can see , most users are uh between thirty six and forty five . Um the the the younger group between sixteen and twenty five is not very big . And to come back on the the swapping uh things , uh I don't think uh , I I think the younger will be most interest in it . Um in the we asked them , uh how would you like a s a new feature . If you have an L\_C\_D\_ on the remote control , what would you think of it . Now you can clearly see young users say . I will that would very nice . And older user think uh they will be scared of change I think . And another thing , how would you like to have a speech recognition on it . Young users uh think that's an interesting idea . And old users not . Uh well we uh found out that there are two several markets at which we can aim . Uh the first are the younger , the age between sixteen and forty five . Uh they are highly interested in the features , as you can see uh here . Uh the second group is the older

group . Aged between forty six and sixty five . They are less interested in uh new features . But uh they spend their money more easily . Well then I come to my uh personal preferences . Uh yeah the first question is uh also we have to ask is at the which market do we aim at . Uh of course n uh saying we aim at the young group doesn't say that old people won't buy it . What I thought , um even young people say it's hard to use , remote control . So if you make a remote control that is uh very easy to use , that's especially aimed at this group , even uh the young group will also be more interested . But when use it , uh I don't know what's uh good thing of speech recognition . Uh less important functions should be discarded from the remote control . You can find most functions on a T\_V\_ set . So uh you don't have to have a lot of audio options , or screen options to change the brightness . And such things . One thing I did not say I think , is that a lot of users also said then I would uh buy a good looking uh remote control if there will be one . So the design of our remote control is very important . If we aim for the younger people , um and there will be uh a lot of features like L\_C\_D\_ or the the the speech uh f recognising , uh the cost will be a lot of h uh a lot higher . Uh I think we don't have that in our budget . And I don't uh I don't think twenty five Euros for a remote is really cheap or something . So it's Yeah , it's hard to uh get the younger group . I think uh the L\_C\_D\_ is cheaper than speech recognition . Uh we go back on the decisions later . Now we have a few new product requirements . So I think that can be an d good option . L\_C\_D\_ . First , teletext . We have internet now so we don't need the teletext anymore . So not necessary . Only for the television . So we don't look at the other things like the radio or something . We look at the age group of forty plus . Uh no , younger than forty . Our corporate colour and slogan must be used . So you can see it on our site . Now we have to decide what controls do we need . Yeah maybe we can first have a discussion uh on the the product requirements you just uh said . I uh personally think uh teletext is a good option . It's a new requirement . Yeah but we don't use it . No discussion about it . Well a power button ? Uh the well um I think separate channels . So So so uh zero to nine or something . To move up , move down . Do we make a menu ? Uh yes I think it will be um q quite easy to use , to have uh uh four arrows . Up-down for channel selection , and left-right uh for volume . And if you press the menu button you get into the menu , On the L\_C\_D\_ screen , you mean ? Uh well yeah that depends on if you have uh the menu on the T\_V\_ . Or you get the menu on the L\_C\_D\_ screen on the remote control . Think it's better to have it on the remote control , But then we come to the costs . But well if you aim at the younger market , um a as they as uh s uh as we seen in the usability uh lab , uh they will buy a nice looking um remote control . So if we have a L\_C\_D\_ sh uh screen , and uh not too many buttons , I think that will incre uh uh even when it's a bit more cost , it will still sell . Is this enough ? Mute . I think that's enough for the next phase . And uh we don't yet have to decide what the remote control would look like ? Or that's for the next phase . Phase two is the conceptual design . And you can find the minutes in the Project Documents folder inclusive the uh buttons . Your individual action , you can find them in the email .

## Complete Meeting Transcript

. Desktop. Yeah. Okay. Well. Make it. Hmm. Hmm. Will this will this add to the cost? Yes but you have to m uh be able to change it. D does it make it more difficult to design? Not much. 'Kay. Um Mm. Yeah. Yes. Okay. Uh um m Yeah. Um yeah okay. This bit too far. So So I'm uh gonna have a presentation about um the market, about um yeah what people think. Uh we did a usability lab-test with a hundred persons. And we looked at uh several um things. Uh among them design, uh d d how d did they like the use of it, uh what frustrations they had while using remote controls. Uh well what what will be our market. And uh we asked them if we had some new featu features. If um that would be a good idea or not. Well our findings. Uh our users, they disliked the look and feel of current remote controls. Um uh they especially found found them very ugly. And um th they also found them hard to to learn how to use it. Uh well they also zap a lot. So uh zapping uh should be very easy. And uh fifty percent of the users only use ten percent of the buttons. So a lot of unused buttons. There is more findings. Uh on the buttons. Which uh buttons find users uh very important and which which not? And how much would they use them? Well uh the most used button is the channel selection. And uh we asked them how uh relevant they think uh the buttons are. The power, volume and channel selections are very relevant. Uh teletext is uh less relevant but also important. Uh not important they found the audio, uh that's not the volume but uh specific the the pitch, or the left or right. Uh the screen and the brightness. And uh channel settings. Uh th and they also are not used very often. Then we have a few um graphs about the market. Uh here we can see what the market share is of uh several groups. Um as you can see, most users are uh between thirty six and forty five. Um the the the younger group between sixteen and twenty five is not very big. And to come back on the the swapping uh things, uh I don't think uh, I I think the younger will be most interest in it. But uh they are not a very big group. Um in the we asked them, uh how would you like a s a new feature. If you have an L\_C\_D\_ on the remote control, what would you think of it. Now you can clearly see young users say. I will that would very nice. And older user think uh they will be scared of change I think. And they won't like it. And another thing, how would you like to have a speech recognition on it. Well here we see the same. Young users uh think that's an interesting idea. And old users not. Uh well we uh found out that there are two several markets at which we can aim. Uh the first are the younger, the age between sixteen and forty five. Uh they are highly interested in the features, as you can see uh here. And um they are more critical on their money spending. Uh the second group is the older group. Aged between forty six and sixty five. They are less interested in uh new features. But uh they spend their money more easily. Now if we look back at this graph, we can see that among the first group is about um sixty percent. And the second group about forty percent. So the the first group is bigger. Well then I come to my uh personal preferences. Uh yeah the first question is uh also we have to ask is at the which market do we aim at. Uh of course n uh saying we aim at the young group doesn't say that old people won't buy it. But less of them will buy it. Um well I uh Okay. What I thought, um even young people say it's hard to use, remote control. So if you make a remote control that is uh very easy to use, that's especially aimed at this group, even uh the young group will also be more interested. And um we can make special features. But uh I think it looks nice in the first time. But when use it, uh I don't know what's uh good thing of speech recognition. Um well th uh that's my second point. Uh less important functions should be discarded from the remote control. It's about discussion we had earlie

r. Um You can find most functions on a T\_V\_ set. So uh you don't have to have a lot of audio options, or screen options to change the brightness. And such things. Um well the design is very important. One thing I did not say I think, is that a lot of users also said then I would uh buy a good looking uh remote control if there will be one. But they found most remote controls very ugly. So the design of our remote

control is very important. And uh yeah it should be very zap friendly, as most users use it for that. That were my findings. Yes. No. Okay. Yeah maybe we can first have a discussion uh on the the product requirements you just uh said. The the requirements you just said, maybe we should first have a discussion about that. I uh personally think uh teletext is a good option. Uh not everyone um who is looking T\_V\_ can go to internet when they want to see the latest news. Okay. Okay sorry. Then uh Mine? It's the functional requirements. D Yeah. Do we make a menu? Uh I think it will be um q quite easy to use, to have uh uh four arrows. Up-down for channel selection, and left-right uh for volume. And uh a menu uh button. And if you press the menu button you get into the menu, and you can use the same buttons. But the then to scroll through the menu and to change the options. Uh well yeah that depends on if you have uh the menu on the T\_V\_. Or you get the menu on the L\_C\_D\_ screen on the remote control. Yes. 'Kay. But well if you aim at the younger market, um a as they as uh s uh as we seen in the usability uh lab, uh they will buy a nice looking um remote control. And also to find the easy to use uh part very important. So if we have a L\_C\_D\_ sh uh screen, and uh not too many buttons, I think that will incre uh uh even when it's a bit more cost, it will still sell. Mm. Yeah. Okay. Good idea. Mm-hmm. Mm. Yeah it's a good idea. But If if it Yeah, I don't I'm not sure if it will make profit enough to uh But it's uh yeah it's uh original idea. No. Oh. That's me. Uh Come on.. Ah. Yes well uh uh I shall give a short talk about the the technical function design. Um I thought the the the technical function design was uh to uh for a remote control to to to have some influence on the T\_V\_ set. Uh both audio and vide video uh in a cordless way. No cords attached. And uh well, it all by pushing a button on the remote. That was from my own experience and uh and uh the previous meeting. Uh I find some uh some interesting quotes on the web. Uh well the same idea here. Uh message to the television. And uh and and and well basic uh operations like on and off, and uh switching channels, and uh and maybe uh teletext or something like that. Uh well these are two uh remotes, and that's our uh our dilemma I think. Uh We just heard from the Industrial Designer how uh difficult it is. But uh shall we make a basic remote control, uh just uh swapping channels and volume and uh power button and well nothing much more. Or uh uh more functions on the remote. Uh maybe more devices you can influence. Uh a radio or a v a video recorder, uh V\_C\_R\_. Yeah well that's our dilemma. Um any ideas about that? Basic or multifunctional? Okay yeah. Yeah well the that was just on my mind. So uh I didn't know what uh what way we would go. Mm yeah well that was my uh functional uh talk. Mm-hmm. Mm-hmm. No. And I don't uh I don't think twenty five Euros for a remote is really cheap or something. So it's Yeah, it's hard to uh get the younger group. Mm-hmm. Just the L\_C\_D\_? Mm-hmm. Well a power button? Uh the well um I think separate channels. So But then both the the separate channels. So so uh zero to nine or something. Uh volume. Oh mine. Technical. Mm yes. Mute. Um Yeah but then it's always uh more than one uh thing to do. Okay. So welcome back. What do do we have to do? So first. I want to say I'm the secretary, so I make the minutes. You find them in your in the map in the From the group. There's the minutes from the first meeting. You'll find the next minutes also t

here. Then I wanna hear from you, what you've done. And after that I have some new product requirements. So And after that we have to make decisions, what we will do. And then we're ready. We have forty minutes for this meeting. After that we'll have lunch. So first I wanna ask the Industrial Designer to tell what he did. So Yeah on your computer, or the What's the name? What's the name of it? It's the technical function or the functional requirements. Working design. Working design. What is this? Product documents. On the desktop. Up. up. Up. Up. Up. Yes. My Documents. Nope. Gone. Well you Um Nah. Nah, nah, nah. PowerPoint. Working design. And Presentation of working design. Save as. Uh it's Project. Save. Very good. Okay. So Now have ten minutes to tell it. Okay. Oh oh. Two

questions. The battery. You say one battery is cheaper. Why? Yeah but when you use two, you can use it two times longer. Okay so it's the size of the remote control. Okay and the buttons. When you use it on the television, you've you need the television, wh which can use it. S Okay. I think we have to use it also on other televisions though. So Yeah but I don't I think it They are two different things though. We have to choose one. It has to work on o uh all televisions. Okay. Yeah. Good idea. Mm-hmm. Yeah but there are much more Nokia telephones than um these ones. Yeah but are their profits bigger than their cost? Yeah but there are also design cost. I don't think When you have a remote control, do you change the cover? Would you change the cover? No. N yeah but I think that too less people would change it for good profit. So Yes it is but I don't think we have to do it. Okay. That's clear. Okay thank you. So now the User Interface Designer. We'll got back on that later. 'Kay, thank you. Then it's your turn, the marketing expert. Okay thank you. Yes. I think uh the L\_C\_D\_ is cheaper than speech recognition. So I think that can be an d good option. L\_C\_D\_. Yes. Only the L\_C\_D\_. So But we'll come back on that. Now Oh, go on. What d d d um Um Uh we go back on the decisions later. Now we have a few new product requirements. First, teletext. We have internet now so we don't need the teletext anymore. So not necessary. Next. Only for the television. So we don't look at the other things like the radio or something. Only the television. Third. We look at the age group of forty plus. Uh no, younger than forty. Is a g big group, and like you showed, n not very much people buy our stuff. Fourth point. Our corporate colour and slogan must be used. Very important for the design. So you can see it on our site. Next. Um no. We have to make our decisions, what we want to do. So like you said, we need the. Maybe it's good to put it in a document. Now we have to decide what controls do we need. So maybe you can tell us. Sorry? Yes. Yes, it's okay. Yeah but we don't use it. It's a new requirement. So, it's not my requirement. We have to do this. No. So what controls do we need? Who first? Okay. Uh power. Uh mm channel. Channel Zero to nine. Volume. Maybe it's easy to pick. What was w your one? Techno Okay. We had w uh no no no no. Where was that example of the Johan. That was the the the the the technical Hallo. Okay. What do we need? On-off. Zero to nine. Yeah that's the channel. Menu? Uh yes the n newer televisions ha do have menus. Uh M Menu. I think um the only one or two numbers. And Hello? That's ch Yes. On the L\_C\_D\_ screen, you mean? Think it's better to have it on the remote control, 'cause it it has to work on all televisions. So we need N Yes. But if we have this So now we don't have a lot of buttons. Is this enough? Mute. Maybe in the menu? Mute. Mm-hmm. Okay. Maybe more? No. Well. Then that's all. This will be the buttons. And I think that's enough for the next phase. So we can go on to Yes. No that's for the next phase. Um Phase two is the conceptual design. So then we'll have the concepts. That's for the So uh next point. Now we have lunch-break. After that

we have t thirty minutes for work. And you can find the minutes in the Project Documents folder inclusive the uh buttons. No. Your individual action, you can find them in the email. So now it's time for lunch. Thanks for coming. That's my task. Okay. Uh I've Where have I put it? My Documents or not? Hmm. I've save it on my computer, my presentation. But where? Uh uh uh It was about the working of the remote control. Nope. Not a of Wait. The working design. But I've saved it. But now I don't know where it is. Hmm. Yeah. And I import this until One more. What the fuck is this? Yeah that's the empty one. I had one. Uh-huh. Open it. Okay here it is. Project. Okay. A little later but here it is. So okay. It's a little difficult what I'm gonna tell you. It's about the working of the remote control. I just had an half an hour j to study it and I don't get it. Ten minutes to tell it. Okay. I think it will be a few minutes and First uh I will tell you something about the findings, what I discovered about the remote control. The working bout it uh of it. Uh then I'll have uh some kind of map, and it's the top of the remote control. With a little bit of science, uh you I will show that uh in in a few minutes. And then uh what I'll think about it. First,

the findings. The remote control is a very difficult uh thing to uh to explain to just all of you wh who haven't seen a remote control uh inside. Uh there's a lot of uh plastic on it, um because its uh not so expensive. And there are uh a lot of uh wires, uh which um connect the components in it, the battery, and there are um switches and things like that. There's a lot of small uh electronics. So it won't be um uh too expensive to build it. Only twelve Euro fifty I think uh we will make it. Now And here I have the top of the remote control. Uh here's some kind of chip. Uh on top of this, there are uh the numbers. Uh you have all on your remote control. And uh the teletext uh button. And uh here's the battery. And when you push the button, it will uh will be sent to the chip. And the chip will um send it to all kind of sub-components. That's what I said, it's very difficult. And after that it will be sent to the infrared. And that will send it to your television. That's a short h uh how it works. Uh I think I can uh make it uh difficult, but we all we all don't get it. My preferences? It's uh it won't be uh We shouldn't make it too big. Uh also for the cost, uh we should only put one battery on it. A long-lasting battery. Uh also for the cost, uh use only plastic. Not other materials. Also because of the cost, uh not too much buttons on it. We can also make uh a button uh with a menu uh button. And then um that that you will see it on the T\_V\_. And on the T\_V\_ you can uh switch into the menu. That's I think it's easier. And the bleep signal, y uh you told us. Uh but we can also use it uh a bleep like something, when the battery's empty, then there is a bleep. Then you'll have to change it in a in a week or something. And also the bleep, when what I told you about uh when you lost it, and you push a button, and then you hear bleep bleep, and we will find it. This is uh just uh Yeah. Yeah. If we w if we use only just one uh small pen-light, then it will be cheaper than when we use two. Yeah but then we'll have to make the um remote control uh long lasting. Just Yeah. Yeah. But uh I think this our remote control is for the televisions we uh we sell in our company? Or is it also for other company uh for other televisions? Then this is an option. Maybe just a menu button to use it on our televisions. And then we make it easier uh for our televisions. And on the other tele televisions, you can also use it, but then we won't use the Yeah? Okay. Then I think uh the menu button uh will only work on the newer televisions. And we will uh look forward and don't make a remote control which for the older televisions. And I just uh have one more idea. Uh maybe it's one of your tasks. But Uh, to have a

trendy remote control, we can also um make something like the Nokia um mobile phones. To change covers. So if you have uh a trendy half with all red, uh yellow and something. And then you can put a red cover on it. And also different things. Yes. Uh then it won't be uh will have just one cover on the uh original one. And then you can buy the covers. I think it will be a little more difficult, but not too much. Just like with the Nokia uh mobile phones. Just one. Yeah but then we'll have to to just um put five covers on it, and see if it works. If it won't works then we'll get something else. Then we uh won't g uh go further with it. Uh a p a a cover made in uh in China, it it won't be I guess so expensive I think. Maybe. I wi I won't. But maybe I think trendy people or like children where you can paint on it, and uh the the children think, oh this is my remote control, uh I made a picture on it. Uh Yeah. Okay. And the other people? What do you think about it? Okay. Okay. You're the Project Manager. Yes. That's it. 'Kay. Yeah. I have uh one question. If we aim for the younger people, um and there will be uh a lot of features like L\_C\_D\_ or the the the speech uh f recognising, uh the cost will be a lot of h uh a lot higher. Uh I think we don't have that in our budget. Do you think? Like No. No. Uh-huh. 'Kay, we'll just have to do that. Okay. No discussion about it. Okay. Unfortunately. To change to the next channel, just one button. To move up, move down. But then we come to the costs. But now we have only the buttons. And uh we don't yet have to decide what the remote control would look like? Or Okay. Okay. Okay. Okay.

---

# Meeting ID: 61

Data Source: Train

## Executive Summary

The Project Manager introduced the project to the group and gave a timeline for the project. The group trained themselves to use the meeting room tools by drawing on the whiteboard. The Project Manager presented the project budget and the projected price point and profit goals. The group discussed several of their initial ideas for the features of the product. They discussed making the remote able to control multiple devices, protection from water or from dropping the remote, and a locator function. The Project Manager then instructed the User Interface Designer to research users' requirements, and instructed the Industrial and User Interface Designers to research the functions and usability features that were discussed in the meeting.

## Complete Meeting Transcript

No no n You should write y the name I think. Me Ah yeah. Yeah. Caramel. And you I think I'm too short for the cables. Quite squarey. He also. Mm. Mm-hmm. I think we shouldn't have too many b for my part. I think If we don't have so many buttons could be nice. Yeah. Something which is not squarey maybe uh, not a box. Yeah. Mm-hmm. And I think we should have a device Sorry. Yeah. directly. Yeah. And I I think we should have something, most of the time I I lose my remote control. We should have s uh special bu button on the T\_V\_ to make the remote control beeping. Ah yeah. Yeah. Barks. Yeah. Yeah whistle. Whistle tracking. Yeah. yeah Okay. Don't panic. Mm-hmm. Mm-hmm. Ah. Hmm. Mm mm mm. Is recorded? Okay? Okay so welcome everyone. So we are here for the kickoff meeting of uh the process of designing a new remote control. So I will first start with a warm welcome opening stuff, then uh we will uh see what will be uh our product and what will be the different step we will have to design it. And uh then we will uh discuss if we have few ideas and we will uh end uh by uh dispatching the different task you will be you will have to fulfil to complete this process. So sorry? You have another meeting soon? So you have to be quick. Okay. So the the goal is to have a remote control so to have an advantage over our competitors we have to be original, we have to be trendy and we have to also try to be user-friendly. So uh the design step will be divided in three uh main points. First it will be the functional design. Third is the conceptual design and then is the desired design. So the functional

design is to identify the main user needs, the technical function the remote control should fulfil. And then we will move to conceptual design where we'll specify the different component involved, what kind of user interface we want and what are the different uh trend in user interface and stuff like that. And then the desired design will consist in uh specifically implementing and detailing the choice we've uh made in the second point. So I will now ask you which is very important for the design of a new remote control for to uh each of us to to draw uh your favourite animal on the white board. Do you have any idea of which animal you want to show us? Okay that's good. n n You should If you want to react uh about this wonderful drawing uh I'll let you uh comment. Okay it's an abstract drawing. I think it's nice and original. Okay. You want to draw something Christine? Of course your animal is recorded so it's not lost. Is this uh Ah okay it's pretty. Okay it's your cat. Okay. Olivier, do you want to Okay I go, but next time you'll do something I'm sure. I'm a bit short on cable. Okay. So what could I draw? Maybe I can draw like a very simplified cow. I don't know if it looks like a cow Like a what? I dunno it it looks more like a donkey in fact I would say. Okay so I hope that it helps you uh in the process of designing a remote control. Okay. Let's move on. So Here the uh financial objective of our project. That is to say to have a production cost lower than twelve point five Euros and have a selling price of twice that price t in order to target a profit of uh fifty uh million Euros. Yeah if it's trendy, original I d fulfil the user needs. We have to discuss that point. On yeah you you can suggest points like this. So what what so we have to decide for example if it can control one device or multiple. So what's what are your ideas about that? Maybe I can have the your opinion from the marketing side? Okay, so if it sold uh by its own i it it would rather be for multiple device. Do you agree? Yeah. So maybe it should be for multiple devices. And uh do you have any ideas um of uh design ideas or any uh uh technical requirement we we should uh fulfil? Few buttons. Okay. And do you have it also to be to be lighted in order to be used in the dark? Might be a good idea. Okay. And do you have any um any uh idea of the trend the

trend in domain, what it shouldn't it should look like, or things like that? With rou okay. Like for okay. Okay. So. Fit in your hand, yeah. And also it have, i it may be it may be important for the remote control to be uh To, to resist to various shocks that can happen if it fall. Water-proof as well. Maybe it is original because you can uh use it in your uh in your bath whereas the others can't. Maybe water-proof would be very original. Havin having a water-proof remote control so that the people can uh use it in their bath. That could be uh Yeah but, it is still something uh you have to buy and that is um not maybe very Yeah, mayb B But maybe we can bulk it with uh already this plastic thing and uh the waterproof uh stuff as well. Yeah. Maybe we can sell uh all that together, so so plastic protection and uh and a waterproof box as well. That might be good uh track to follow. Optional or sold with it? Yeah. Maybe we can have uh But we don't design the T\_V\_. Maybe we can have uh something you whistle and uh the remote control uh beep. Yeah, barks, yeah. So we can uh have a whistle uh remote control? I don't know, whistle-able? Th Whistle tracking yeah. Whistle tracking remote control. That's a good idea, that's very original and that's can uh improve. Yeah d d uh. Yeah but s still we have to mm we have to have an advantage over our competitors. I think this is a good advantage. Yeah. We have to ask Yeah. We have to ask the quest of that's uh design to the uh Industrial um Designer. Which is you. Okay so try to find that for next meeting. Okay. So next meeting is in thirty minutes or so uh. Don't pani. So so I will ask the Industrial Designer to find out more about this industrial design so any working any working function we have discussed. So then I will ask the User Interf Interface Designer to to think about the point we discussed like the number of buttons, the the fact that is lighted or not, things like that, and what would be convenient for the user. And also um I will ask the Market Expert to uh try to find out

what are the absolute requirements, what is absolutely needed in a remote control uh for the user. So. And then uh I will uh just ask you to think about that and uh look at your mail because you will receive uh some good advice soon. So. Thank you I think that's all for this point. Anyway you will receive some messages. Be careful. You eat it? Does it move uh? Okay, but I don't know if it uh is still correctly uh We'll see. How do you wear this thing? Not too many cables and stuff. Original. Uh. Just one thing. Uh, you said twenty-five minutes, but I have something else to do uh, so gotta have another meeting uh soon, so maybe you could hurry up a bit It's true. I have another meeting so if you could uh Yeah. Yeah, for the lawnmower project. Okay. What an original idea. Orangutan. Can I give you the no? But I don't have to say anything. When I'm drawing the orangutan. It's an abstract drawing of an orangutan. Yes. I don't have a red colour. Usually orangutans have red hair so this is a very important but I don't have red pen, so Yes. Yes. I know. Wha what is this strange beast? Is it a monster? It's a cat? I thought these things did not exist. Ah yeah Does have a name? Caramel. Ah-ha. Next time I concentrate. He looks like a bong. Okay. Sorry. No. Scary? I I think we will be finished this uh Is it for uh for putting a for logos, no. That's I is there a matter for a new remote control? Is it uh a single device remote control or is it a multi-device remote control? Ah this is not defined at all? Ah, okay. Well uh do we sell other stuff? Uh if we bundle the remote control with something uh to sell then it could be a single device, otherwise it could be programmable one otherwise who would buy a remote control from us. Yeah. No, I couldn't I cannot think of any requirements right now. Mm. Something like that, least fits in your hand. Yeah. The basic requirement. Only a buck. Waterproof. Mm. B it seems uh so,

but uh if you don't have an waterproof remote control it means you can just cover it with some plastic and you can sort of f And, and that's one of the that's one of the shock I mean there are people that have a remote control and they are worried that it's going to break and they put some extra plastic around it. That's people they actually do it themselves. I it will look a bulky in that case. Like as an optional thing. Barks. That's that's quite cool, but uh of course we you don't normally need uh any audio uh recording stuff on your remote control right? So i it's just going to add t to the cost. It's cool. I think I like the idea, but I'm not sure about the what you, who is giving who's giving who's giving our budget. Who's Yeah. Yeah. 'Kay. Mm-hmm. Mm. Good. Uh, so we come back in five minutes? Half an hour. Okay uh sorry. You have to imagine a little bit um. This Sorry too uh. Is it beautiful? Do you know? It's a cat. Isn't it? Yes yes is it like that. Is it better? Okay. It's my cat. Yeah. The name is Caramel. Yeah. Thank you

---

# Meeting ID: 62

Data Source: Train

## Executive Summary

Okay , we've got half an hour for this one um to uh discuss the um functional design . and I've put the minutes of the last meeting in the project folder . Um so I guess just to to recap on uh what we did last time . Um kind of uh got to know each other a little bit and uh got familiar with all the equipment and started to discuss um a bit about the project , you know , cost-wise how much how much money we had to s Um just want to tell you that you have three new requirements , which is the The first one is that um uh the company's decided that teletext is outdated uh because of how popular the internet is . so we don't really need to consider that in the functionality of the of the remote control . Um they've also suggested that we um we only use the remote control to control the television , not the V\_C\_R\_ , D\_V\_D\_ or anything else . I think the worry is that if the project becomes too complex then it'll affect um how long it takes us to get it into into production , the time to market . So um , we're just gonna keep it simple and it'll just control the T\_V\_ . And the other thing was that the company want the corporate colour and slogan to be implemented in the new design . Um I'm not entirely sure what the corporate colour is . It might be yellow , because there seems to be a lot of yellow everywhere . And the slogan , like the actual written slogan , or just to embody the idea of the slogan ? uh th because on the the company website , uh what does it say 'Bout putting the fashion in electronics . I mean do they Is that something they want actually written on it , 'cause it's quite long . So those are the three things , just not to worry about teletext , uh only control the T\_V\_ , and um and uh incorporate the uh colour and slogan of the company . time for presentations then . so this is the technical functions design . to do the um the design I have I've had a look online , I've had a look at the homepage , Um I've had a look at the previous products to see what they offer Um , having a look at the existing products , I found out that um it tends to come in sort of two extremes , there's either um a very complicated one that's got lots of buttons , lots of colours , very confusing , you don't know what you're doing . Um in that case the the labelling tends to be very bad . here um the button there and there . That one's perg and that one's prog , and it doesn't really tell you what it does . Um , not sure if you had a look at the other um control in that example . Um it's a very simple one . It's got only the basic functions mm but um it's the same size as the the hard to use one . Uh it looked a bit clunky . They're very big and not very much use for buttons . and it's just very hard to access the advanced functions . Um , my own preferences , I prefer the the clunky one . Um so I believe the the advanced functions should maybe be hidden in a drawer , So , now I'd like to ask for

your preferences . Which which is the clunky one , the one on left or on the right? . Um , the clunky one is the one on the right . Um I think it's supposed to be the same size , but um it's got much fewer buttons . Well I think it's a valid point . I mean like the one on the left looks quite um quite complicated , Um so I see I see why yo you know you might prefer the simpler design , you know you get a lot of remote controls where you kind of flip the thing open , Um , do we have any functions that um we'd want on it ? I mean so far I've got um on and off , um switch the channel up and down , and put the volume up and down . and then actual numbers for channels as well , yeah . Um , you say that's a h a required one or a requested one ? God , I wou I would say that's required , I mean there's no way anybody's gonna buy a remote control these days when if you can't actually individually select channels , uh any kind of like display controls at all do you think we need to worry about , Well I think I think es essentially what we're doing right now is we're categorising . We're saying well we want this to be a product that offers all the sort of more tricky features but we want them to be in another area ? um we need to find out exactly what we have to have um and after that we can add things if they're possible . Um , so so far , just to recap you've got volume and channel control and There's um on and off , um volume and channel , and skip to certain channels with the numbers . Well , one one way I would look at this um would be that we a approach the different controls in terms of um like control types , so that for the user it's very clear what they want to do where they go . Uh and also think maybe a little bit about sorta w w what would just wanna be acc easily accessible . For example if we had audio controls , those could be something people set up very rarely . Maybe they're un they're they're they're in a little area but covered up um , things like channel and volume um are used all the time , so we just have them right out on top , Um so maybe we need to think about having three or more groupings of controls , you know like one which are just the the habitual ones that should be right within your natural grip . and then others that are concealed . and then maybe just things that would be nice if it could do would be things like audio set up and display set up and things like that , maybe like a mute button , I dunno whether this is for good or for bad but there'll be a lot of kind of uh redundancy in the in the the issues and the the uh the things . what I've already started doing is cr I created a slide in in my presentation here so that we kind of think well what's the cumulative effect of what we've taken from your ideas and and mine , Obviously obviously what you've just told me what you've just told me impacts a lot on what um like market research mm that that I've been Mm hard to know what where your role ends , yeah . Before I bring this up what I'll just say is um what I've what I've done is tried to collect some information so that I can then relay this to to you guys so that it's now becomes a collective thing . And then kind of lead us in the direction of deciding , 'kay what what are our options , what should we decide So what I basically got is I just looked into some information and sort of th tried to think about how how we could review it and what kind of decisions we could take away from it So um I'm thinking here about uh primarily about customer needs , and what are issues with with um existing products . and also about try and connect that as you see with the company vision So this is what I've found here , Um , users dislike the look and feel of current remote controls . Most people find them ugly . Um the vast majority would spend more money for it to look fancy as well , we'll see later , the vast majority would spend more money for um slightly more intuitive control , such as voice recognition . Um most people use only a f a very slim portion of all the controls . they tend to use the most simple controls if for me this is sorta like three different different um inspirations , you know , one is that we want uh something

that's high-tech but we want it to seem easy . And in spite of the primitive side of it and the very high-tech side , we want it to just be an appealing piece of equipment in people's hands . They get lost a lot , Um , takes time to learn how to use them . and I will admit I don't know what R\_S\_I\_ stands for . uh adults at least would pay more for voice recognition . Now apparently we do have access to all the tech cutting edge technology in remote control . if that's possible we might consider getting into it . I think a recurring theme here is the company wants it to be wants us to make something that's fashionable and sleek and trendy . You know , they like the aesthetics and the ergonomics . So if you wanna group all the different kind of types of functions together , you know . my hope here is that I'm putting out this information so that we can then say okay , well how do we collectively move on with it . Um I I haven't brought out one specific marketing idea , Well , um one of the things that we have to decide on by the end of the meeting is who we're gonna be um who's our our target audience , our target market . Um , so if we want something that that looks good and is easy to use , but has y is fairly powerful product , whatever , who do we really want to aim that at ? Where's the money , maybe . Yeah , who wou who would have the money to spend . it's somebody who's not gonna just use the remote that comes with their telly , I suppose , Um , I think it'll be the mid range to the high end market , in terms of people . Um 'Cause twenty five Euros for a remote , how much is that lo locally in pounds ? is that a lot of money to buy an extra remote or a replacement remote ? Mostly focused around the twenty five age group . Um do you think then uh voice recognition is something we should really seriously consider ? It does it does fit with the market that we're sort of identifying , I think we are gonna have to narrow it down , and 'cause you know , there needs to be some kind of selling point to it . if we are going to include speech recognition , it's kind of between fifteen and thirty five seems to be like a really high response to that . I I think twenty five to thirty five is is fair to add that in as a group as well Okay , so fifteen to thirty five , look fairly young . So these are people who are gadgety , right ? So they'll not sh not shy away from something quite high-tech . so shall we make the decision uh to include speech recognition I I think one thing we should try not to avoid is not to say we have to use speech recognition right now , because um , based on what you've go y everybody's saying , right , you want something simple . Speech recognition might not be the simplest thing for somebody to use . Could it be an on off thing ? but what I'm saying is that we're we're trying to lock ourselves into a s particular kind of technology , rather than focusing on on exactly what are the features that we're gonna say , and then , you know , say speech recognition is good for this , speech recognition is not good for this . but at end of the day we don't look at the technology , but we look at the function first . um might have been a good idea to all deliver our presentations and then discuss , well it's good to get ideas out while they're fresh in mind . is if we make it um speech reco if we incorporate speech recognition , that's appealing to people um maybe with a physical disability as well . And also it helps in terms of people not losing this , I reckon one problem with speech recognition is um I've actually seen one of them used and uh the technology that was in that one wasn't particularly amazing , so you end up yelling at the control for hours . Do you think maybe we need like further advances in that kind of area until it's worthwhile incorporating it though ? I think it'd probably quite expensive to put in . Well this is just the working design um . Um I guess I try to define like what we're doing now , but we're we can't n we haven't narrowed down um exactly what the things we're trying to fulfil , like I think back in the back of our minds we know what the basics are . Has to change channels , has to change volume , but in like specifics , right ,

which one of the basics are you trying to target . so I'll go into the diagram first . It just explains how the process goes through , from the basic technology point of view , the basic steps that you need 'Kay , a battery or something , to keep it going . you need some power source . Um and that power source is important because it ties you down to um how long the device will last . Like for example , voice recognition , right . That might be constrained because that you might need to power a microphone , so that's one perhaps constraint there . Th Okay , the basic thing is there's a user interface You know , and that um picks up an input from a user , a series of logic has to decide what the user is telling the device , Um and then it needs to be able to send the signal out to the device itself like um voice recognition , right , if it's something which is important then we just add more power rather than having a thing that we don't have enough power . maybe you you wanna go back to what the functions are ? Well , do you want do you wanna finish up your your whole presentation then ? Yeah , w I'm done . Um you have a transmitter , an input device , logic chip , Since we're on the topic of the technology , uh are there any like what are our options ? Is this the only way that we go about it , or are there other thin Um , these these aren't technology options in that sense . a basic principles and basic components that are needed . So each component represents one function , but I think the basic functions are the logic , the transmitter , um and the receiver , okay , and the power are things that you won't have to care about . Um there might be one other consideration which would be that the the transmission between the remote control and the T\_V\_ for example . Okay , um are we gonna restrict ourselves to using the traditional technologies of infra-red thing ? Because that's something you need to actually be physically be pointing to . Right . Well well a worry that was was expressed in the new requirements was that if we made this too complex it would e it would effect um how long how long it took us to get this to market , so I th suspect it might be a good idea just to restrict our kind of our creative influence on this on the user interface um because I mean it's tried and tested intra-red , so we could stay with tha Um if somebody's gonna h talk to the device , you ideally want them to hold it to them . so because if you're using infra-red , the line of sight um say the T\_V\_'s at that chair , and I'm standing in front of here and the transmitter is here , it blocks it . Uh does c is our controller is it have the option of being um on a standard uh frequency as all of the other equipment , There's there's not much specific specific information , In the new requirement spec they said just to focus on the T\_V\_ , Um , is it worth considering like having like a charging unit as opposed to just regular batteries ? or should we just consider running on regular batteries ? Okay , from from a from a component point of view there's added complexity , and you add cost to it , You need a docking cradle , for example , for you to put it in to charge . Or you need to get the user to plug it in . Um and most users are very f use already used to the idea of buying batteries and putting it into the controller . then I don't think rechargeable is something we should you know , we really need to care about . Okay , so just stick to to regular was that um the the whole point of this meeting was to f absolutely finalise who we're gonna aim this at , I'm just gonna just recap uh what I said at the start , Are we all happy about the idea of um aiming the product at um the fifteen to thirty five bracket ? Yeah , that's good . I think we just say that it was gonna be the the most basic stuff possible . Um on off , up and down channels , up and down volume and uh skip to a channel . Um and also the funct the the actual functions of what it's gonna do . And is it going to include any of the uh the more advanced features , I think we include mute , but apart from that um I think we just we'll go for the simpleness . is it not an option still that we include some things just as a sort of under like sort of under a door or some

Yeah , it's as optional functions . 'Cause what what I'm I'd be a bit worried about is if someone was h had previously developed habits of expecting to control surround sound or this and that with their controller and then and then they , you know , w they get ours and w it's doesn't have that . Another thing that you were saying about categorising the controls ? Um maybe I could suggest we we break them down into three simple categories . One would be audio controls , one would be video controls , and the other one would be a device . um it's something they do other things to like turn it on and turn it off . I mean like so what we could have is like three buckets , right , where we could throw things into , and then from there decide whether it's basic , or it's non-basic . Mm okay , great . um for uh our Industrial Designer , you're gonna be thinking about the components concept . Um User Interface Designer gonna be thinking about our user interface , Um so uh I guess just to just to confirm that we know what we're doing in the next well in the thirty minutes after lunch anyway , Um and then we're gonna have thirty minutes of working on the next stage . and marketing you're gonna be thinking about trend watching . Um and you'll all get specific instructions as well . shall we agree for sake of um sort of clarity and when we when we r resume that we'll u use this idea David's proposed , where we think of these three sort of buckets and anything anything we discuss about them is sort of , okay , we're talking about this . Yeah , yeah I think that's definitely a good idea . Device is basically anything which we can't categorise , right . so you're gonna have um audio which is gonna be like you know your bass settings and actual volume hi And then video is anything that you can see . Okay , so brightness , contrast , things like that , And then k I suppose quite likely what would happen is in the d device category there might be some which are just like the habitual standard Um so yeah , I guess just things to think about are you know like the fact it's gotta look good , Um something maybe kind of quirky in design maybe . Make it kind of ergonomic kind of to hold ,

## Complete Meeting Transcript

I'll go first. Alright um, can I st steal this from the back of your laptop? Uh so this is the technical functions design. Um Right to do the um the design I have I've had a look online, I've had a look at the homepage, which has given us um some insp inspiration from previous products. Um I've had a look at the previous products to see what they offer and um I would like to ask you guys for um your ideas about the design at the end of the meeting. Um unfortunately we're not allowed to talk outside the meeting room, so Um, having a look at the existing products, I found out that um it tends to come in sort of two extremes, there's either um a very complicated one that's got lots of buttons, lots of colours, very confusing, you don't know what you're doing. Um in that case the the labelling tends to be very bad. Um there's an example I'll show you at the end, um sh show you now. Uh here um the button there and there. This one's prog. Sorry. That one's perg and that one's prog, and it doesn't really tell you what it does. Um, not sure if you had a a look at the other um control in that example. Um it's a very simple one. It's got only the basic functions mm but um it's the same size as the the hard to use one. Uh it looked a bit clunky. They're very big and not very much use for buttons. Um, and it's just very hard to access the advanced functions. There's there's nothing for instance for a slow motion button. Um, my own preferences, I prefer the the clunky one. Um it's very easy to use. Um but unfortunately it does lack

the advanced functions which I quite like having on the controls. Um so I believe the the advanced functions should maybe be hidden in a drawer, or something like that from the bottom of it. So, now I'd like to ask for your preferences. Um not sure of how long we've got, uh Um, the clunky one is the one on the right. Um I think it's supposed to be the same size, but um it's got much fewer buttons. It's, you know, it's very spread out and kind of you know, I get the idea it'd be sort of about this size. got very few buttons on it and Um, do we have any functions that um we'd want on it? I mean so far I've got um on and off, um switch the channel up and down, and put the volume up and down. Um they're just the the very basics you could use for a T\_V\_. Okay. Um, you say that's a h a required one or a requested one? Would you like um the channels like the the numbers on thing, um Um, yeah. Um Uh, to start with um sort of a bit both, um we need to find out exactly what we have to have um and after that we can add things if they're possible. There's um on and off, um volume and channel, and skip to certain channels with the numbers. Do you want to switch places? Just just switch them. Think maybe the the wire in the back might be loose. Um Well, did you not say it was the the adults that were going for the the voice recognition? Sort of the the older group. Uh f Yeah. I reckon one problem with speech recognition is um I've actually seen one of them used and uh the technology that was in that one wasn't particularly amazing, so you end up yelling at the control for hours. Channel up. Um I think it'd probably quite expensive to put in. Um. I think we just say that it was gonna be the the most basic stuff possible. Um on off, up and down channels, up and down volume and uh skip to a channel. Ta. Um I think we include mute, but apart from that um I think we just we'll go for the simpleness. Yeah. Um just about the three buckets, um what would go in the the device functions one? Um Is that alright now? Okay. Sorry? Okay, everybody all set to start the meeting? Okay, we've got half an hour for this one um to uh discuss the um functional design. All ready to go? Okay. Um so hopefully you've all been working away, and I've put the minutes of the last meeting in the project folder. Um so I guess just to to recap on uh what we did last time. Um kind of uh got to know each other a little bit and uh got familiar with all the equ

ipment and started to discuss um a bit about the project, you know, cost-wise how much how much money we had to s Um just want to tell you that you have three new requirements, um which is the The first one is that um uh the company's decided that teletext is outdated uh because of how popular the internet is. Nobody uses teletext very much anymore, so we don't really need to consider that in the functionality of the of the remote control. Um they've also suggested that we um we only use the remote control to control the television, not the V\_C\_R\_, D\_V\_D\_ or anything else. I think the worry is that if the project becomes too complex then it'll affect um how long it takes us to get it into into production, the time to market. So um, we're just gonna keep it simple and it'll just control the T\_V\_. And the other thing was that the company want the corporate colour and slogan to be implemented in the new design. Um I'm not entirely sure what the corporate colour is. It might be yellow, because there seems to be a lot of yellow everywhere. Well that's the thing, I'm I'm not sure um uh th because on the the company website, uh what does it say Uh something Yeah, I mean do they Is that something they want actually written on it, 'cause it's quite long. Um or yeah, just the idea, but I'm not sure. So that's something we can discuss as well. So those are the three things, just not to worry about teletext, uh only control the T\_V\_, and um and uh incorporate the uh colour and slogan of the company. Um so is everybody okay with any of that, or do you want me to recap at all? Right um, time for presentations then. Who would like to go first? Okay, cool. Oh yeah, of course, yeah. G go on ahead. Mm-hmm. Okay. Alright. Oop. Um. Well we can chat away for uh for five minutes or so I think at at most. Just a couple of minutes anyway. Mm-hmm. Shall we sh well we'll stick to kind of your area for now. Yeah. Looks kind of Yeah. Well I think it's a valid point. I mean like the one on the left looks quite um quite complicated, and that

P\_R\_T\_ p P\_R\_O\_T\_ thing is incredibly confusing. Um so I see I see why you know you might prefer the simpler design, but yeah you don't want to lose out on, you know, what it does, so maybe you know you know you get a lot of remote controls where you kind of flip the thing open, I think that's a good idea. I think it's a good idea. Mm-hmm. Uh-huh. Uh-huh, and then actual numbers for channels as well, yeah. God, I would say that's required, I mean there's no way anybody's gonna buy a remote control these days when if you can't actually individually select channels, I mean would anybody disagree with that? Um, what else, uh So don't need to worry about teletext, don't need to worry about V\_C\_R\_, uh any kind of like display controls at all do you think we need to worry about, you know like brightness and contrast? Mm. Yeah. I think are you are you maybe kind of thinking what we absolutely have to have and what would be nice? Mm-hmm. Okay, right. Well, do you wanna maybe just, at this point decide on what we absolutely must have as a p as a function of this. Um, so so far, just to recap you've got volume and channel control and Right okay. Um Mm-hmm yeah. Oka Mm-hmm. Okay. Uh well, just to to wrap up quickly on this this little section Have I just lost Oh no. Um, uh do you think maybe that's the only kind of uh essential requirements, and then maybe just things that would be nice if it could do would be things like audio set up and display set up and things like that, maybe like a mute button, that sort of thing. Any of you anything to add to that at all? No. Okay, right. Um okay, if we can move on to next presentation then please. Um Do you wanna Probably not, actually. Yeah. bit complicated. It'd be nice if everything was wireless, wouldn't it? Right. Oh, like overlap between what you said? Oh well, for all you know that that'll happen. Mm hard to know what where your role ends, yeah. Okay. Uh pr yeah, press fun

ction and F\_ eight, yeah. Mm. Yeah, you wanna Oh oh here we go. There you go. Um Okay. Right. Can you um Right, okay. Yeah. Mm-hmm. Mm-hmm. Repetitive strain injury. Mm-hmm. Okay. So want something that looks good and is easy to use, big priorities. Okay. Mm. So if you wanna group all the different kind of types of functions together, you know. That's I think it's a good idea. Mm-hmm. Okay. Mm-hmm. Okay. Right. Well, um one of the things that we have to decide on by the end of the meeting is who we're gonna be um who's our our target audience, our target market. Um, so if we want something that that looks good and is easy to use, but has y is fairly powerful product, whatever, who do we really want to aim that at? I mean Yeah, who wou who would have the money to spend. Well i if if like twenty five Euro is our is our selling price then you can imagine, well I don't I'm not really sure how much that will retail at. But you want it's somebody who's not gonna just use the remote that comes with their telly, I suppose, they're gonna actually go out and buy one. So, who do you think we're aiming this at? It's about sixteen, seventeen pounds, I think. Yeah, okay. Okay. Okay. Yeah. Yeah, yeah. Okay Okay. Yeah, so do you think we're we're aiming at a fairly young market then? Yeah, okay. Um do you think then uh voice recognition is something we should really seriously consider? What what do you think, Craig? N yeah. I think we are gonna have to narrow it down, to say let's target these people and give them what they want and 'cause you know, there needs to be some kind of selling point to it. So um anybody anything there to add Just kind of young professionals, uh th like if we are going to include speech recognition, it's kind of between fifteen and thirty five seems to be like a really high response to that. So we could say that was our target. Yeah. Mm-hmm. Okay, so fifteen to thirty five, look fairly young. You know, they have bit of expendable income to spend on this sort of thing. Yeah. Yeah. So Yeah. Yeah. So they'll not sh not shy away from something quite high-tech. That that's that's a good point. Um okay, so um so shall we make the decision uh to include speech recognition if we can. Okay. Why is that? Okay. Where you can activate it and deactivate it? Yeah. Okay. Okay. Uh-huh. Okay. Uh okay, well do you wanna um give us your presentation and then then we can I don't know um might

have been a good idea to all deliver our presentations and then discuss, but this is this is how we're Yeah, exactly, yeah. Oh it's something that's just occurred to me as well is if we make it um speech reco if we incorporate speech recognition, that's appealing to people um maybe with a physical disability as well. Um. Yeah. Yeah. Mm-hmm. Really? Do you think maybe we need like further advances in that kind of area until it's worthwhile incorporating it though? Mm. Course not. There you go. Right. Mm-hmm. Mm-hmm. Mm-hmm. Uh-huh. Hmm. Mm-hmm. Mm-hmm. Okay. Okay. Uh. Well, do you want to finish up your whole presentation then? Are you all done? Mm. Okay. Okay. Right. Okay. Mm-hmm. Mm-hmm. Oh. So this just show how we're kind of modularising the whole thing. Okay. Mm-hmm. Yeah. Mm-hmm. Okay. Okay. Okay. Well well a worry that was expressed in the new requirements was that if we made this too complex it would effect um how long how long it took us to get this to market, so I th suspect it might be a good idea just to restrict our kind of our creative influence on this on the user interface and not worry so much about uh how we transmit it um because I mean it it's tried and tested intra-red, so we could stay with tha Mm-hmm Oh, yeah. Yeah, mm-hmm. Okay. Mm. Mm. Yeah. Okay. Okay. W Yeah. W Well well we've um In the new requirement spec they said just to focus on the T\_V\_, so that's what we should do for now I think. Something I was wondering about was the power. Um, is it worth considering like having like a

charging unit as opposed to just regular batteries? I mean is that something we really want to go into, do you think, or should we just consider running on regular batteries? Uh-huh. Uh-huh. Yeah. Okay. Okay, so Yeah. Yeah. Okay, so just stick to to regular Okay. Um, right. So basically the um I'm just gonna just recap uh what I said at the start, was that um the the whole point of this meeting was to f absolutely finalise who we're gonna aim this at, and what exactly the product's gonna do. So um just to recap on Are we all happy about the idea of um aiming the product at um the fifteen to thirty five bracket? Um and also the funct the the actual functions of what it's gonna do. Do you wanna recap on that, Craig? Okay, right. Okay. Yeah, it's as optional functions. Okay. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. Okay, right. Um, okay well I gotta kind of got five minutes to wrap up now. Um next thing we're doing is having lunch. Whoohoo. Um and then we're gonna have thirty minutes of working on the next stage. Um so I'll be putting the minutes of this uh this meeting into the project documents folder. Um so uh I guess just to just to confirm that we know what we're doing in the next well in the thirty minutes after lunch anyway, um for uh our Industrial Designer, you're gonna be thinking about the components concept. Um User Interface Designer gonna be thinking about our user interface, and marketing you're gonna be thinking about trend watching. Um and you'll all get specific instructions as well. So um I dunno, just just to to ask now if you've got anything else you've thought about while we've been talking. Um, do you wanna start with David. Anything else to say at all? No, okay. Andrew? Yeah, yeah I think that's definitely a good idea. Uh-huh. Yeah. Yeah. Okay. Yeah. Okay. Okay. Okay, so you're gonna have um audio which is gonna be like you know your bass settings and actual volume hi Okay. Okay, and then visual Okay, so brightness, contrast, things like that, and then just actual device things, like what channel you're watching, turning on an off, stuff like that. Okay, um Mm-hmm. Yeah. Okay. Okay. Okay. Um so yeah, I guess just things to think about are you know like the fact it's gotta look good, because of who we're we're, you know, targeting this at. Um something maybe kind of quirky in design maybe. Make it kind of ergonomic kind of to hold, you know, things like that. Um, so I guess I guess that's it. That's the meeting over. Whoohoo. Mm yeah. Nope, we're all set. Which which is the clunky one, the one on left or on the right?.. Okay. No. I'll add it later, I guess the presentation. No. No. Um function F\_ eight. Function, the blue button. Next to the control on the left. Yeah. You have to push it

together. Yep. Nope. Try that again. Wait. Yep, there we go. Increase that 'cause we can't see the That's much better. There you go. Bouncing on top. Is installing a new remote control something that people Um, I think it'll be the mid range to the high end market, in terms of people. 'Cause twenty five Euros for a remote, how much is that locally in pounds? Is that too is that a lot of money to buy an extra remote or a replacement remote? Right. Um so maybe not the high end range, but maybe middle, middle up-ish. Kind of. You know how much? I dunno I guess you pay, what, ten ten quid for a remote? Like a simple replacement, right. I mean if you lost your remote and the first thing you just wanna go out and get, would you how much would you pay? Yeah. Yep. I I think twenty five to thirty five is is is fair to add that in as a group as well because that's more than half your group of people who are willing to at least try and use your technology. Yeah. I think perhaps that age group is significant as well because those are people who use the computer, who are familiar with their with computers in in their everyday work. I think people who are maybe about I wouldn't say thirty five, but people who are about forty-ish and above now w

ould not be so dependent and reliant on a computer or a mobile phone or something like that. So these are people who are gadgety, right? People who are u growing up used to, you know in schools and in universities, when you go on to their working lives, people who would you know regular Yeah. Yeah. Mm. I I think one thing we should try not to avoid is not to say we have to use speech recognition right now, because um, based on what you've go y everybody's saying, right, you want something simple. You want basic stuff and you want something that's easy to use. Speech recognition might not be the simplest thing for somebody to use. Um, but what I'm saying is that we're we're trying to lock ourselves into a s particular kind of technology, rather than focusing on on exactly what are the features that we're gonna say, and then, you know, say speech recognition is good for this, speech recognition is not good for this. So maybe we should I suggest that we think about speech recognition, anyway it's a it's something that can be used to fulfil a function, but at end of the day we don't look at the technology, but we look at the function first. Okay, sure. Sorry, do you mind passing me my notepad. Thanks. Cool, um. Okay. Um. Well this is just the working design um. Well this is just what how I would go about it. Um I guess I try to define like what we're doing now, try to define what we're trying to get done. Um I think in a practical way, we kind of know what it is. We've used it, we're familiar with it, but we're we can't n we haven't narrowed down um exactly what the things we're trying to fulfil, like Besides the basics, I think back in the back of our minds we know what the basics are. Has to change channels, has to change volume, but in like specifics, right, which one of the basics are you trying to target. Um are there certain parts of the basics that are more important or less important than the basics? Um and I just the idea is just to get everybody to um I usually have a have have a design that's there as a basic, so, you know, things that to start everything going. But I guess everybody does have some idea, so I don't think um there's a need for that. Um okay this finding things is a little bit confusing, so I'll go into the diagram first. It just explains how the process goes through, from a from the basic technology point of view, the basic steps that you need um in the diagram and in this slide probably works better. Um okay, you need some power source. 'Kay, a battery or something, to keep it going. Um and that power source is important because it ties you down to um how long the device will last. Um it ties you down perhaps a bit later on in terms of the technologies um how far you can transmit the signal or the complexity of the functions that you want. Like for example, voice recognition, right. That might be constrained because that you might need to power a microphone, you might need to power other things, so that's one perhaps constraint there. Um Th Okay, the basic thing is there's a user interface where people punch a button or talk into it or smile to it or blink their eyes, whatever. You know, and that um picks up an input

from a user, um uh a logic a series of logic has to decide what the user is telling the device, and the device has to r you know, based on you push button A\_, so I will do something with button A\_. So maybe button A\_ is the power button, okay. Um and then it needs to be able to send the signal out to the device itself which is the receiver here. Um and I think that's about it in terms of my design um. It's fairly general, um and I guess the purpose of this is also not to restrict you in in the way you're thinking, like um voice recognition, right, um, if it's something which is important then we just add more power rather than having a thing that we don't have enough power. So it's not really a constraint in that sense, but I mean these are functionally, you know, the base, what the technol

ogy has to do. Um so I guess the rest of it I think we should maybe you you wanna go back to what the functions are? I think that's more relevant to a discussion? Yeah, w I'm done. More or less. Yeah. Ps Oh, it's just putting the rest of it into words, but it's essentially the same thing. Um you have a transmitter, an input device, logic chip, you know, stuff like that. Um I guess this would be Yep. Um, these these aren't technology options in that sense. This is just um a basic principles and basic components that are needed. For example, if you needed um if you needed to add uh a voice recognition, right, then your user interface would be split, broken down into more components, right, which you have a microphone, the V\_R\_ and stuff like that. Uh Yep. Yep. So each component represents one function, but I think the basic functions are the logic, the transmitter, um and the receiver, okay, and the power are things that you won't have to care about. Um and those are things that based on what your user interface requires then we'll add more functionality to it. Um there might be one other consideration which would be that the the transmission between the remote control and the T\_V\_ for example. Okay, um are we gonna restrict ourselves to using the traditional technologies of infra-red thing? Because that's something you need to actually be physically be pointing to. Right. Yep. There might be one other problem with the transmission, um in particular right now, since we're talking about voice recognition. Um if somebody's gonna h talk to the device, you ideally want them to hold it to them. I it you may not require that, but you know, um it's it's it's something very natural, I guess, you know, to hold it, to signal to the user, and push a button maybe to start s talking about it. Then you need to send the signal out, so because if you're using infra-red, the line of sight um say the T\_V\_'s at that chair, and I'm standing in front of here and the transmitter is here, it blocks it. So in that sense, there's not really a restriction but it's something which you may have to think about later on in the process. Not so much further down. There's there's not much specific specific information, but I think that um one indication of infra-red mean that you're just targeting traditional devices. Because infra-red is something which everybody has. There's a there's Okay, from from a from a component point of view there's added complexity, and you add cost to it, um and then there's probably the fact that you need another physical component. You need a docking cradle, for example, for you to put it in to charge. Or you need to get the user to plug it in. Um and most users are very f use already used to the idea of buying batteries and putting it into the controller. But unless the controller's gonna consume a lot of batteries, like he's gonna run through like twenty batteries a month, then I don't think rechargeable is something we should you know, we really need to care about. Um. Okay, I think Another thing that you were saying about categorising the controls? Um maybe I could suggest we we break them down into three simple categories. One would be audio controls, one would be video controls, and the other one would be a device. Um this may not map very well to advanced functionality especially, but I think that um from a manufacturer's point of view, from a person designing the device, but I think from a point of view of a person using the device, you know a T\_V\_ is something they see and something they hear, um it's something they do other things to like turn it on and turn it off. I mean like so what we could have is like

three buckets, right, where we could throw things into, like if we want this feature, let's throw it into there, and then from there decide whether it's basic, or it's non-basic. I mean it might help with the visualisation. And it would actually help with the component build as well. Mm no, not really. Mm. Um things I

like on off. Because they don't have anything to do with what you see. I mean in terms of picture and the entertainment value, you know, um so um And channel. Because the on off also goes, you know, like on off like power, not on off sound. Not on off video. Although you don't turn off the video on your T\_V\_, but um you might wanna you know turn off the sound, say you wanna pick up the phone, there's a mute button, right, so you you have you have a choice of putting it on to um others or a device. Device is basically anything which we can't categorise, right. We put it out. Yeah, anything to do with what you hear, right. You you put that into audio. And then video is anything that you can see. Um. Yep. Yep. Yep. Like random which we have no other place to put, but we need it somewhere there. Um even even if it doesn't map very clearly what happens is that people at least have some in their mind. It's easy to use, I think that's one thing that um and I guess from the component point of view it's easy to build as well 'cause things are like fixed. Could you plug me in? Okay. Thanks. Okay. 'Kay. Okay. And the slogan, like the actual written slogan, or just to embody the idea of the slogan? 'Bout putting the fashion in electronics. Sure. Right. Mm-hmm. M yeah, like a lot of a lot of what I've um read and prepared for this meeting fits in really closely with what with what Craig's just gone over. So in part I could I could give you some of my personal preferences but I could also th add some to this which is just about sort of um sort of market research. But anyway, um we might come to that later. Um clunky in what sense, like um h heavier? Larger? I see, so it's more just basic. Right, okay. Yeah. Yeah. Sure. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Which was that? Up the numbers, or the up down? Yeah. Yeah. We don't? No? Yeah. Well I think I think es essentially what we're doing right now is we're categorising. We're saying well we want this to be a product that offers all the sort of more tricky features but we want them to be in another area? Is that right? Is that what we're we're doing? We're kind of like sorting them an Or are we actually eliminating things we just don't want the product to have? Yeah. Yep. Well, one one way I would look at this um would be that we a approach the different controls in terms of um like control types, so that for the user it's very clear what they want to do where they go. Uh and also think maybe a little bit about sorta w w what would just wanna be acc easily accessible. For example if we had audio controls, those could be something people set up very rarely. Maybe they're un they're they're they're in a little area but covered up um, things like channel and volume um are used all the time, so we just have them right out on top, um very just very sort of self-explanatory. Um so maybe we need to think about having three or more groupings of controls, you know like one which are just the the habitual ones that should be right within your natural grip. And others that are uh also available and then others that are concealed. Something like that. Yeah. Mm-hmm. Yeah. Sure. Can this can this pl reach? Can this plug come across? No. So why don't I just pick up and move then. Here, I'll just Why don't I just Mm er, can you go up behind me? Kinda This is so This I'm all in a knot now. Okay. Um. So I can I can say already, I dunno whether this is for good or for bad but there'll be a lot of kind of uh redundancy in the in the the issues and the the uh the things. Yeah, yeah. Which is ma not necessarily a bad thing, but may what I've already started doing is cr I created a slide in in my presentation here so um so that we kind of think well what's the cumulative effect of what we've taken from your ideas and and mine, because certainly I I have a hard time separating separating things completely. Obviously obviously what you've just told me what you've just told me impacts a lot on what um like market research

mm that that I've been So how do I how do I get this up? Okay. Okay. Alright. So F\_ eight? Oh, and F\_ eight. Okay. Mm-hmm. Okay, I think that that's doing it now. Uh, again? Okay. Um, okay great. Okay. Just um Before I bring this up what I'll just say is um what I've what I've done is tried to collect some information so that I can then relay this to to you guys so that it's now becomes a collective thing. And then kind of lead us in the direction of deciding, 'kay what what are our options, what should we decide and do you know what I mean, so. Okay. Okay. Alright. That would be Okay. So um does that make sense? So what I basically got is I just looked into some information and sort of th tried to think about how how we could review it and how we could and what kind of decisions we could take away from it and then maybe by the end of just looking at some of these things we can think about what are our priorities. 'Cause certainly there's lots of different information to go through. So um I'm thinking here about uh primarily about customer needs, that we start with the customer, and w you know, what they want and what are issues with with um existing products. Uh to think about trends and also about try and connect that as you see with the company vision which is about fashion in electronics. Um and then, as I say uh w we'd like to prioritise our design features from this and um Dunno. Okay. Um. So this is what I've found here, um a lot of this is new to me, so we'll just read through together. Um, users dislike the look and feel of current remote controls. So they find them ugly. Most people find them ugly. Um the vast majority would spend more money for it to look fancy as well, we'll see later, the vast majority would spend more money for um slightly more intuitive control, such as voice recognition. Okay I'm gonna we'll look at that in a second. Um most people use only a f a very slim portion of all the controls. So I guess what we're looking at here is people want this h technology, they tend to use the most simple controls and overall they find remote controls to be something they don't doesn't really appeal to them. So I think what we're doing is we're trying to take like if for me this is sorta like three different different um inspirations, you know, one is that we want uh something that's high-tech but we want it to seem easy. And in spite of the primitive side of it and the very high-tech side, we want it to just be an appealing piece of equipment in people's hands. Um, frustrations. They get lost a lot, s as it came up in our last meeting. Um, takes time to learn how to use them. This is uh why I mention when Craig was uh showing us some ideas that we actually try and group controls, so d it doesn't just look like a big panel, kinda like when you you look at, you know, a new computer keyboard, or something that is quite explanatory. If you want audio, if you want visual, then you have those. Um and I will admit I don't know what R\_S\_I\_ stands for. Uh, no, that did not come up at all. Um so here here is another um sort of a review here of the main things. I also found that most people would uh adults at least would pay more for voice recognition. Now apparently we do have access to all the tech cutting edge technology in remote control. So I dunno if that's possible we might consider getting into it. Um. And and again here as we sort of move m sort of thin start thinking about how we wanna sell and market this, I think a recurring theme here is the company wants it to be wants us to make something that's fashionable and sleek and trendy. Um people uh additionally aren't aren't liking the appearance of their products, so we wanna think about as we take all the sort of the techie features how we can um put that into a unit which is which people like. You know, they like the aesthetics and the ergonomics. Yeah. Yeah, so you know just c looking at what what Craig um Craig's i uh ideas are s sorta tell me that maybe w

hat we wanna do is try and um separate the different things that we wanna include in this. So if we do say well we want there to be all the technology will we try and make that almost be like optional technology. You know, it's like like I find a lot of T\_V\_s these days, something really like about 'em is if you wanna just turn 'em on and off you can, but they have little panels where you click and there's just like tons of features you go through. Yeah. Yeah. That's s that's sort of the um But I I'm my hope here is

that I'm putting out this information so that we can then say okay, well how do we collectively move on with it. Um I I haven't brought out one specific marketing idea, although my sense is that what we should try and think about is what are the current trends in materials and shapes and styles, and then use that. But not let that confine us technologically. So Alright? Any um comments on all of that? That's uh Yeah. Okay. Where's the money, maybe. Yeah. And who watches T\_V\_. Mm-hmm. Mm. Mm-hmm. Yeah. Mm-hmm. Yeah. This this kinda touches on your comments there, David. These are the age groups which we have information on and these are this is a table of h what people would pay more for a certain feature. Just gives us a rough idea of where the w the will to spend money on T\_V\_ equipment is. Mostly focused around the twenty five age group. Sort of young professional, kind of. Mm-hmm Uh, yeah, it's the Yep. It does it does fit with the market that we're sort of identifying, in terms of Okay. Yeah. Sure. Sure. Yeah. Mm-hmm. Mm-hmm. Yeah. Yeah, yeah. Yeah. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. But yeah. Yeah, sure. Mm-hmm. Yeah. If we can. Yeah. Right. Could it be an on off thing? Like if you want it on Yeah. Yeah. Yeah. Sure. Sure. Yeah. Sure. Yeah. Sure. Yep. Yep. Yeah, it's good well it's good to get ideas out while they're fresh in mind. Um Not Yeah. And not losing. And also it helps in terms of people not losing this, you know they they're saying oh it's I lose it in the couch. like we're kind of what we're b sort of getting in into here is mating different uh design features together that they Right. Oh really, you've seen one before. Right. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Okay. Mm-hmm. 'Kay. Sure. Sure. Yep. Right. And like on the means b Since we're on the topic of the technology, uh are there any like what are our options? Alright, what's what i in Is this the only way that we go about it, or are there other thin Right. The basic principle of 'Kay. Right. Okay. Okay. Mm-hmm. Mm-hmm. Okay. Right. Right. Right. Right. Okay. And um just a clarification before we finish this. Uh does c is our controller is it have the option of being um on a standard uh frequency as all of the other equipment, so that the one controller can control several pieces of equipment? Okay. Just to T\_V\_, okay. Okay. Mm-hmm. Mm-hmm. Yeah. Okay. Okay. Yeah, that's good. And is it going to include any of the uh the more advanced features, or are we gonna eliminate those? Okay. R is it is it is it s is it not an option still that we include some things just as a sort of under like sort of under a door or some 'Cause what what I'm I'd be a bit worried about is if someone was h had previously developed habits of expecting to control surround sound or this and that with their controller and then and then they, you know, w they get ours and w it's doesn't have that. I dunno if that'd be a problem. Yeah. Okay. Okay. Yeah. Right. Yeah. 'Kay, okay. Like that. Okay. Mm-hmm. Mm okay, great. Mm-hmm. Mm-hmm. Um yeah, just I just wanted to ask then before we wrap up, shall we agree for sake of um sort of clarity and when we when we r resume that we'll u use this idea David's proposed, where we think of these three sort of buckets and anything anything we discuss about them is sort of, okay, we're talking about this. Shall we do that, then? Okay, great. And and channel. Right. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Colour, yeah. Sure. Sure. Ok

ay. And then k I suppose quite likely what would happen is in the d device category there might be some which are just like the habitual standard and then others which are maybe a bit more Yeah. Sure, okay. Okay. Okay. Mm-hmm. Mm-hmm. Great. Then we get to go find out what was picked up for lunch for us.

---

# Meeting ID: 101

Data Source: Train

## Executive Summary

This Then we'll go through the finance and see if we fall within the budget . Um then we'll do the evaluation , and then we can finish up after that with um any changes that we'll need to make , We had uh the fashion trends that people want a fancy look-and-feel . Um they liked fruit and vegetables in the new styles . Um and a spongy feel . Um they wanted limited buttons and simplicity . Um the iPod , we really liked the look of that . the materials for the case , the different energy sources , the different types of chips , um and made a decision on what we were going to use to make our remote . basically we we st went with the colour yellow . Um working on the principle of a fruit which was mentioned , it's basically designed around a banana . These would be like the rubber , the rubber grips . Um but all the controlling would be done with this scroll wheel . And the the simplest functions would be um almost identical to an iPod , And then to access the more complicated functions you'd you sorta go , you press that and go through the menus . we could use the voice . It's as simple as you , we could make it really . Plastic covered with rubber . T the actual thing might be smaller . It's a quick on-off button . You guys are gonna help me do an evaluation of the criteria . we're gonna be doing it based on a seven point scale . And one is going to mean true , that we did actually achieve that . With seven being false , we did not achieve that . So for the first one , we need to decide , did we solved the problem of the users who complained about an ugly remote ? I think it's definitely different than anything else out there . I'd say , when it comes to the ergonomics , the form and stuff , yes that's definitely more beautiful than your average . So uh to answer that honestly I would rather say like uh , we have not solved the problem completely with the ugly remote because the colour is ugly , definitely . I mean I much prefer something like brushed chrome with that form . Four is fair . Did we make it simple for new users ? It's very intuitive , I think yeah . Um , do the controls now match the operating behaviour of the users ? 'Cause we've we've brought it down to basically four controls most common , which are channel and volume . So that's a one . How about the problem of a remote being easily lost ? Something that big and that yellow you just don't lose anymore . But um if we were to , if we were , that , the speech recognition . That , we could maybe just use that solely for the the finding thing . Y you could add an extra feature actually . Which makes this thing raise hell when you remove it too far from the television . That can't cost much . Let's add one of those features and say yes . Two . Are we technologically innovative ? It's all just stolen technology when it comes down to I don't know that we are that innovative , to tell you the truth . Um I would say we're probably

at four . Um spongy material ? We have some spongy , yeah . It's not a one though . Probably a four at most . did we put the fashion in electronics ? I'd say we did . Well the recent fashion is rather displayed in the in the L\_C\_D\_ and the way you operate it than the form and the colour , Now we just gotta calculate . Okay we'll say two point four two . Now we get to do the budget numbers . We want a fifty percent profit on this . Um and how many batteries do we think this will probably take ? Two . That's the advanced chip-on-print , yeah . 'Kay then the case is a Probably it's double curved . Case materials are Plastic . That's not a special colour . It's a specially ugly colour , but it's not special . Well we only have one button so really we shouldn't be charged , we shouldn't be charged anything for the the button supplements . So our total is fifteen point five . by three Euros over . What if we completely took out the the one single button we've got on . I suppose the L\_C\_D\_ C\_ display's the one that's pushing it up a bit though . you could maybe take out the L\_C\_D\_ dis display even , Right . We may not need it . I think that perhaps the project evaluation's just supposed to be completed by me . But I'd like to hear your thoughts . Uh h what did you think of our project process ? yeah I think we did quite well . Um Our leadership was quite weak in the beginning . But as the day went along we had more idea of what we were doing . and um I think it was um interesting as you guys brought up more um information and studies that we were right on with a lot of those things . Super super . I had some problem with the pen I think , Minus your PowerPoint fiasco . Um complete the final questionnaire and meeting summary . And I still have to do my minutes for the last meeting . Um so there will probably be another questionnaire coming up . And then we'll have to check with the main boss whether we can , what goes on after that .

## Complete Meeting Transcript

Yep. Soon as I get this. Okay. This is our last meeting. Um I'll go ahead and go through the minutes from the previous meeting. Uh and then we'll have a, the prototype presentation. Um then we will um do an evaluation. Uh or we'll see what, what we need to have under the criteria for the evaluation. Then we'll go through the finance and see if we fall within the budget. Um then we'll do the evaluation, and then we can finish up after that with um any changes that we'll need to make, or hopefully everything will fall right in line. Um let's see, minutes from the last meeting. Um we looked at uh the the trends. We had uh the fashion trends that people want a fancy look-and-feel. It was twice as important as anything else. Um they liked fruit and vegetables in the new styles. Um and a spongy feel. So we were talking about trying to incorporate those into our prototype. Um they wanted limited buttons and simplicity. Um then we looked at the uh the method for coming up with our own remote. Um looking at other other devices. Um the iPod, we really liked the look of that. Um we also had uh the kid's remote for a simple idea. Um a two part remote, which was what were were originally looking at. Uh and then um there was talk of spee uh speech recognition um becoming more uh predominant and easier to use. But I think we've still decided not to go with that. Then we looked at the components um the materials for the case, the different energy sources, the different types of chips, um and made a decision on what we were going to use to make our remote. Um and basically how, what were making for the prototype. So I'm going to leave it at that and let you guys take over. The prototype yeah. Do you need a this? Okay. Very nice. Mm-hmm. What but what's that button? Uh, 'kay. 'Kay. Would you like to uh Well done. Well

luckily we are going to find out. Or not luckily. Um do you have a marketing presentation for us. I think it's definitely different than anything else out there. So if they think that what is out there is ugly, then yes I would say, I would say most definitely. It's bright. It still has your traditional black. Yep, not angular. Mm. Yep. Yeah something more modern to go a a modern colour to go with the modern form. Yeah. I would say four. Very non-committal, four. Yeah. Mm-hmm. S scrolling through and selecting a few. I think that's a one. So if we incorporate speech recognition into it then it could And it is quite bright and Uh Yeah. But if we do go with the, with the speech recognition, then it, then our scale goes up quite a bit I think. Probably two. You know. If we eliminate the fact that you know it's impossible to guarantee that it's not gonna be lost then I'd say two. With the speech recognition, which of course may be changed depending on budget. Which, which may be cheaper than speech recognition if it were just a Some sort of proximity Pray that you don't accidentally lose that piece. Okay. Two. It's But there's not a lot of yellow, there's not a lotta yellow. Course that wasn't really we were kinda forced to take that colour. I don't know that we are that innovative, to tell you the truth. If we added the screaming factor then we go up. Um I would say we're probably at four. We have some spongy, yeah. No. Yeah. Because it's only got what, these parts are the grips and perhaps the back side the bottom the underneath on the back. Probably a four at most. Possibly even a five. If your fashion is b is Carmen Miranda, you betcha. It's true. Seven is Two point two point four? Something. And what what is the acceptable criteria? Is there like a scale that we have to hit? Alright then. Okay. Well, let's see. Now we get to do the budget numbers. You didn't know that you were gonna have a budget. But we do. Okay. So I have here an Yeah. We want a fifty percent profit on this. Oh you can't really see that very well. Twelve and a half Euros is what supposed to cost us. Okay, so Well let's see. The f the Wonder if I can make this W

hat the Oh it won't let me do that. Okay. Alright so at top, I don't know if you guys can read that or not. I can't 'cause I don't have my glasses on, but so we've got the energy source. There's uh four, five, six categories. We have energy source, electronics, case. Then we have case material supplements, interface type, and then button supplements. Okay so Uh first of all energy source, we picked battery. Um and how many batteries do we think this will probably take? Probably some e either two or four. Two? Like it. Excellent. This is consumerism. Alright so for the electronics our choices are simpl simple chip-on-print, regular chip-on-print, advanced chip-on-print, sample sensor, sample speaker. 'Kay, we have one of those. 'Kay then the case is a Probably it's double curved. Case materials are plastic. Um I guess it's two, since one for the top, one for the bottom. Is that right or is it just one? Maybe it's one because of the 'Kay. I guess it doesn't matter 'cause the price on that one is zero, which is nice. Special colour? Interface type. We have pushbutton, scroll-wheel interface, integrated scroll-wheel pushbutton, and an L\_C\_D\_ display. So we actually have the L\_C\_D\_ display and then is it the integrated or is it Yeah. 'Kay. Button supplement? Special colour? Um special form? Special material. Or titanium. They cost us all the same. Well we only have one button so really we shouldn't be charged, we shouldn't be charged anything for the the button supplements. Um Okay. We're gonna leave that one blank because we run on a L\_C\_D\_ and scroll. So our total is fifteen point five. Which I believe is by three Euros over. So the only thing better than um a banana-shaped remote is one that you shake. Yeah 'cause the Well 'cause we have to have both right? Mm-hmm. So we may not need the L\_C\_D\_ display? Well there we go. Twelve point five. Okay. So we just remove our screen here. Besides look at what the L\_C\_D\_ does to our lovely remote. Back to the design room boys. Okay so the costs under twelve point five Euro. Was no. We redesigned it. Now it's yes. Next slide. Project evaluation. Uh project process, satisfaction with, for example, room for creativity, leadership, teamwork, means, new ideas found. Um

So I guess that Let's see here. I think that perhaps the project evaluation's just supposed to be completed by me. But I'd like to hear your thoughts. Uh h what did you think of our project process? Good. Yeah I think we st we started off a little little weak. Our leadership was quite weak in the beginning. Um um But as the day went along we had more idea of what we were doing. Um room for creativity? There was that. Um I think we tried a lotta different things and um I think it was um interesting as you guys brought up more um information and studies that we were right on with a lot of those things. Um you guys worked together well as a team. And um the means? Which was the whiteboard and the pens. I had some problem with the pen I think, but minus your p Well Have a we have a list of employees that you would like fired. Okay. N new ideas found? Um Yes for the remote. Maybe no not f for technology. Alright. Closing. Costs are within the budget. Project is evaluated. Um complete the final questionnaire and meeting summary. That's it. And I still have to do my minutes for the last meeting. Actually. Um so there will probably be another questionnaire coming up. And then we'll have to check with the main boss whether we can, what goes on after that. But that's the end of our meeting. Can try to plug that in there but Right. That's what we have there. That's plastic. Plastic covered with rubber. We might uh add some more underneath here. Maybe give it, give it a form. I mean you're supposed to hold it like that, but um just if you grab it, take it from somewhere, so yeah, you have some rub yeah. Exactly, use both. Might as well think about Th think about the button as well. Like either put either one one on either side or not do it

at all. It's a quick on-off button. That's um yeah I think it's pretty important. So you don't have to fiddle with that. Right? Um that's not um I'd say a bit smaller would probably be nice. You wanna play with that over there. There you go. Right.. I'd say, when it comes to the ergonomics, the form and stuff, yes that's definitely more beautiful than your average. However the colour, we don't have a say in that. That has been, that has been dictated pretty much by the company. So uh to answer that honestly I would rather say like uh, we have not solved the problem completely with the ugly remote because the colour is ugly, definitely. 'S nothing you can say about that. I mean I much prefer something like brushed chrome with that form. But Right. Right. It's different. You don't want your uh three feet huge L\_C\_D\_ display in your living room that's hanging from the wall to be controlled with something like that. Yeah. Yeah. It's very intuitive, I think yeah. S give it a one. Right. Right. So that's a one. Something that big and that yellow you just don't lose anymore. Oops. Hmm. Well what S Mm. Oh yeah. You probably Mm. Y you could add an extra feature actually. Which makes this thing raise hell when you remove it too far from the television. We could add that but that's nothing we have thought of so far. Yes. It's it's Um the it's based on this anti anti-theft technology for suitcases and stuff, where you have one piece that's attached to your luggage, another piece that starts beeping. That can't cost much. So that can also easily be integrated because these things are small enough to to hide, so you have one piece, you have to glue somewhere behind your stick it behind your T\_V\_ and the other Right. That'd be tough then. Well also your remote would uh alarm you if somebody stole you t your television, yeah. Ran off with it without taking the beautiful remote control. Let's add one of those features and say yes. Two. Uh It's all just It's all just stolen technology when it comes down to right right right right. Yeah not really. Right. Yeah well you have that, kind of, sort of. It's not a one though. One would be the whole thing to fold and stuff. Yeah. So that's a four at most. Y yes. More Well the recent fashion is rather displayed in the in the L\_C\_D\_ and the way you operate it than the form and the colour, but it definitely is. I'm impressed. I can't do that without a calculator. Fifty percent, you're kidding. P It's too much. Um Uh Battery. Two. At four it's gonna be too heavy, so that that's not our problem. People can change it every month. They won't know until after they bought it.. That's the advanced chip-on-print, yeah. Double

curved, yes. Plastic. N no. No that's just one. It's just one mo single mould, we can do that. Exactly, right. That's not a special colour. It's a specially ugly colour, but it's not special. S Yes unfortunately. We could of course make the buttons wood. Say mahogany or so Mm-hmm or titanium. Uh just Yeah that's too much. It's hard to believe. So we'll go for the hand dynamo huh? I mean let's let's face it, it also depends on the software on the on the television. You can have the the information that this thing transmits be being displayed on the on the screen. So s yeah let's take away the Yeah. Yeah. Right. Right. We may not need it. There you go. Perfect. Okay, the So we can just take away a heck of a lot of the there you go. central? Oh that's just yeah. There you go. Oops. There you go. One more criteria. Fair enough. Great. Yeah. Just half a day, you have a remote. There you go. Super super. Well that's not my fault. That's obviously the people I work for uh that work for me, uh they've just you know Heads are gonna roll, believe me. Yes yes.. Pretty impressive. Kind of a banana. I do. Okay. You guys are gonna help me do an evaluation of the criteria. Um. Okay. So first I'll just discuss some of the criteria that I found. Just based on the past trend reports that I was looking at

earlier. And then we'll do a group evaluation of the prototype. And then we will calculate the average score to see how we did. Um so the criteria we're gonna be looking at are the complaints um that we heard from the users who were interviewed earlier. So we're gonna be doing it based on a seven point scale. And one is going to mean true, that we did actually achieve that. With seven being false, we did not achieve that.. Okay. So for the first one, we need to decide, did we solved the problem of the users who complained about an ugly remote? Mm. Mm. Yeah I think the colours detract a little bit. That's true. Yeah. Um okay so, do you think, since we This was a a sign criteria, do you think maybe we should put it somewhere in the middle then? Does that sound good? What do you think? Three? Four? Five? Four is fair. Okay. Okay, the second one. Did we make it simple for new users? One, 'kay. Okay. Um, do the controls now match the operating behaviour of the users? I'd say that So one? Yeah? Okay. Okay um the fourth one. How about the problem of a remote being easily lost? One of the number one complaints. Whether you want to or not, you're not gonna lose it. Okay. That's true. Mm. Annoying alarm or something? Yeah. So. Are we adding one of these two features? gonna say okay. So we're back to a one? Or a two? Two, 'kay. Okay. Are we technologically innovative? From iPod yeah. But for remotes yeah. Two? Three? But how many remotes do you see like this? Not so many. Really? Okay. That's gonna hurt us. Okay. Um spongy material? 'Kay. And lastly, did we put the fashion in electronics? I'd say we did. 'Kay. Alright. Now we just gotta calculate. Six eight twelve sixteen. Seventeen divided by s Eight. Well I haven't done math in years. What two I dunno. Okay we'll say two point four two. Right? How does that look? It's been a while. Oh no. They just told me to pick my own criteria and have you guys evaluate it basically. So that's that. Oh my god. Okay. Yeah we'll go with that. Not too shabby. Right. Oh. Bright yellow. It'd look really lovely. Yeah. Leave it blank. Perfect.. What's the blue part? Oh that's the batteries. Okay. Looks more like a banana. Trying to fill in some time there. Good teamwork. Minus your PowerPoint fiasco. No I know. I'm yeah. Incom Mm. Kinda. We might have a while though. The prototype discussion. No. There is our remo the banana. Um yeah basically we we st went with the colour yellow. Um working on the principle of a fruit which was mentioned, it's basically designed around a banana. Um but it would be held in such a fashion, where it is, obviously it wouldn't be that floppy 'cause this would be hard plastic. These would be like the rubber, the rubber grips. So that's so that would hopefully help with grip, or like the ergonomics of it. Um but all the controlling would be done with this scroll wheel. You have to use your imagination a little bit. And this here represents the screen, where you, where you'd go through. And the the simplest functions would be um almost identical to an iPod, where that one way ch through channels, that way th other

way through channels. Volume up and down. And then to access the more complicated functions you'd you sorta go, you press that and go through the menus. It's that that simple. That just represents the infrared uh beam. That's a simple on and off switch. Um I don't know, we could use the voice. T that blue bits should be yellow, d that that'd be where the batteries would be I suppose. And um that's about it. It's as simple as you, we could make it really. Is there anything you want to add? Yeah. Doesn't make much make much difference. You could work left-handed or right-handed I suppose. T the actual thing might be smaller. Yeah. Just the on and off. Yeah. It's you know it's flimsy 'cause it's made out of heavy Play-Doh, but And whether or not it would fall into the cost everything I suppose. With the scroll and the L\_C\_D\_. Yeah. I would. It's bright. It's It's curved. I

t's not there's no sharp angles to it. Some people might say it. Yeah. Yeah. Yeah. Yeah. Yeah. I think that was the main aim, one of the main aims that we had. Uh yeah. 'Cause we've we've brought it down to basically four controls most common, which are channel and volume. And then the other ones are just a matter of just going, just scrolling further. Yeah. Yeah. It's bright yellow. Bright yellow's hard to lose. But um if we were to, if we were, that, the speech recognition. That, we could maybe just use that solely for the the finding thing. That was what we'd we'd mentioned. Just just to use, to find it when it was lost. But like I said, like I don't think you'd lose something so yellow so easily. And it's not gonna fall, like a rectangle would slip down behind things. That's gonna be a difficult shape to Yeah. Maybe in the middle again, three or four or something? I mean you know loo losing things is one of those things that people can lose, I mean a million ways. You can pick it up and walk away with it and then you've lost it. Yeah. Yeah. Yeah. Yeah. Yeah true. But I mean d just those whistling, clapping key rings you have. They're cheap. So it can't be that expensive. Yeah. Yeah. stick it on the T\_V\_. Yeah. Two. I'd say so. Uh don't get many mo remote controls with screens on. Yeah it's stolen technology. But we have. Fa 'cause it's stolen. No maybe not. Yeah as much as as needed, I think. Yeah. Yeah. Yeah. On the Yeah. Be what we were told, and they'd say yeah, definitely.. Is that some long division? No. Just, I'm sure there's a. No I can't do long very impressive. Yeah. Yeah so. You'd been going a long time dividing that. It's two point four two eight five se it just keeps going on. Two point four two basically. Charge about three hundred quid for it. We're advanced chip are we? Yeah yeah. S That's Yeah. And then I'd say the integrated. Mm. remote control. No that's getting a bit tiny. Yeah. I'd ignore that. If it w What if we completely took out the the one single button we've got on. And just had a scroll wheel interface. And the L\_C\_D\_ display. I suppose the L\_C\_D\_ C\_ display's the one that's pushing it up a bit though. Yeah. Yeah. Yeah you could maybe take out the L\_C\_D\_ dis display even, if it if it comes up on the computer itsel on the T\_V\_ itself. Uh that is possible yeah. There we go. Screen. Make it a bigger dial. Easier to use. Even easier to use then. That was just we ran out of yellow. There you go. Even simpler. Yeah. For all those fruit lovers out there. Yeah. I think we did yeah I think we did quite well. Um Yeah. Right from the start of the day. We sort of knew where we were going straight away I thought. Yeah. We've used the whiteboard. Technology used. Excellent.

---

# Meeting ID: 45

Data Source: Train

## Executive Summary

The project manager opened the meeting and went over the minutes of the previous meeting. The user interface designer and industrial designer then presented two prototypes of the remote the team is working on and discussed the options for components and materials to include in their design. The first prototype featured a simple design with only a small number of buttons. The second prototype was shaped like a banana and used scroll push button technology. The marketing expert then led the team in conducting a product evaluation of the prototypes in which the prototypes were evaluated on the basis of their fanciness, technological innovation, ease of use, trendiness, and marketability. Overall, the prototypes performed quite well in the evaluation. The project manager then examined the production costs of the remote. The cost to produce the remote was 9.20 pounds and did not exceed the project budget. The team then conducted an evaluation of the project process, in which they indicated that they were quite happy with the tools available to them, the ideas they came up with, and their teamwork.

## Complete Meeting Transcript

Yes. Alright. Well. Yeah, well you see, each made one, we didn't have enough yellow dough. This is the one that I made. It is uh curved, easy to hold, hand-held, nice and small with big easy buttons. This is like a scroll, but they are push buttons and they enter takes you into the different menus. Of course we need someone who's experienced with the television. I mean this is the infrared thing that's gonna zap at the television. Uh I'm not quite sure how to make that, but I'm sure it will work. Uh this is on off switch, 'cause I think we do need that, and I think it gives it a nice balance. And it's gonna have the logo imprinted on it uh in there. Um as for what it's actually made of well the function of these buttons is up, down, left and right in the different menus. Uh position, I presume that just means right right on it, easy to see. The main feature of it is just a simple design, simple, lack of uh buttons all over the place. Right? Form curved, kind of smooth, hand-held, makes it feel nice to hold. Uh material, I think Kate's gonna tackle that quite a bit, but I think we have two different options, because we did make a another one, which wa uh is in the shape of banana, it's just if you can imagine this as yellow with black buttons,

like just like this but in the shape of a banana, which is also nice and easy to hold and feels good and has a similar sort of scroll push button technology, just a slightly different design. Also with on off switch and infrared uh I had envisioned it in hard smooth plastic. So like uh well, I dunno, what's it like? I guess like an existing remote control, but molded and smooth. Whereas otherwise we'd thought, like with this one or mix and match, just we were gonna see what you thought, the uh a more spongy rubber cover with spongy buttons. So we have the two options we can follow, either the smooth hard plastic or the spongy rubber, depending on cost restraints. And what we well, what conclusion we reach when we discuss it. Uh material yeah, that's what I have to say about material. Can I scroll down on there and see what else Well colour, I think I definitely have a preference towards bright yellow with black buttons, because that's the company colours, but if anybody's got any other suggestions, I'm quite willing to consider them as well. So, it just depends what you think about these ideas and if I'm yeah, maybe, Kate, you better say what you think about them. I thin as for as for the fruit or organic theme, I guess this one is obviously fruit shaped. This one has n banana, yeah. This one has no obvious connections to fruit, but because it's round and molded, it kinda makes you think sort of organic, touchy-feely, kiddie, it's more like yeah, you'd expect it to be like a child's sorta toy remote control instead of a real one, which I quite like that sort of image. 'Cause it's very big and chunky and child-friendly and Hold them, you see, you know. Curvature, is it to your liking? If you don't wanna tire out your thumbs after all. Yeah. Breaking, oh right. Well you see, that's why hard plastic would be quite a good thing for it, because then it'd just be rigid. Yeah, we really like we really like that design, I mean it looks just like a logo, that arrangement of the keys. Like a c like a compass point, you know, just up, down, left and right, and we think we could make that quite a good feature. And it's like the the iPod scroll wheel, but better. Yeah. Yeah, yeah, I mean it that's what it makes me think of, mobile phones, I was try I was thinking, moving your thumb like this, what does that remind me of? It's texting. Hmm. Yeah. I mean the thing is we do need to develop our technology of I mean actually how to program the menus and what sort of, you know, text box is gonna appear at the bottom of the screen, but we do definitely think that it's a viable option. Uh yeah, we're finished. Yeah, what about price, is that gonna go on there as well? Price of materials. Not that we actually

know anything about it, but we can we can pretend. It depends what what you mean by fancy really, 'cause when I think of fancy, I think of it's got lots of extra sort of fripperies and, you know, like baroque curliness and which I'd call these quite uh minimalist, simple and plain, but I mean I do see what it is heavily reliant on appearance instead of pure functionality, so in that respect it is quite fancy. I think just maybe we need a different word other than fancy, I'd say maybe aesthetic. like stylish or aesthetic. Fancy. Did you just break the pen? Well d we'll just call it fancy then. Yeah, I think we n we need to they're both yellow with black buttons, it's just that we didn't have any more dough to represent uh that, but if you can just imagine banana shape with these bits as black. So what we re really need to decide is whether we want the actual banana shape or just a a purely blob or some sort of abstraction in between the two that isn't that is more curved, like a banana, but that isn't actually recognisable as a banana, you know, with the grooves and the stalk and stuff, so. So that's maybe not something we have to decide just right now, is it. Just somewhere a long the scale of in between these two. Yes. Oh yes. Well, maybe only a two or a three then, 'cause it's no we still haven't decided about specific sponginess or specific Yeah, I don't really think that's gonna work, but No. No. Well it is quite it is quite quirky I think. It could be quite a good brand, like a good little object. Oh, we also need tho think about the energy. Is it the kinetic energy? If it's it is gonna be environmentally friendly with the kinetic energy. Yeah, but we haven't completely developed that side of it yet, so we're not completely sure about that,

but yeah. Yeah. I would say maybe a two, 'cause we still we need to uh get somebody in who is good with the programming for the menus and things. I mean it's not just like I mean it's not like ev you know, on a normal chunky remote every button res I mean means something different, whereas this one has only got the four buttons and they all they mean everything, depending on what menu you're in. uh we need somebody to develop that. Yeah. Just putting no excess buttons. As for see if we're technologically innovative, I'd say it is quite innovative, because there aren't really many that have this menu idea instead of all the extra buttons. I mean I know we're not doing anything involving internet or speech recognition but but we are at the upper end of the push button market. Well, just kinetic then,. It's the wind-up. What does double curved mean, I don't understand. Oh no, we don't need that. No. Single-curved, I'd say. I I just wanna say plastic. It's just button. Yeah. Yeah. Well yeah, like the compass point one. Yeah, they could be plastic. Great. Yes. Yeah. And Play-Doh. Yeah well, 'cause I mean it's so hard to describe what you mean just with words and pointing at photographs and saying, well we quite want this, but imagine it rounder. So much better just to go and, you know, this is it, this is what we want. Yeah. Spongy. And I'd never heard of the kinetic energy before, so. Good work as a design team, because we Oh yes. Yes. Yeah. And the the only false one is because we've chosen to keep a simple old technology, which if it works perfectly well I see no point in improving on if it works, so. Yeah. So we do count as I think excellent or one.. Bring on the ice sculptures. Yeah. That's what I said, ice sculptures. Is that the end of the meeting? Red. Agenda three. Mm. I like the fact that on both of them the keys play such a prominent role. It's really kind of a Mm-hmm mm-hmm. Yeah. But it's also like texting, you don't Yeah. It's also in terms of um being lost it's it's quite it looks quite different. You know, I I d I have several four remotes, and they all look the same until you get up close and you have to you know, this is really identifiable. Mm-hmm. Mm-hmm. No, okay. Um sh

all I take your uh power? Oh. Okay. This is going to be a heavily interactive evaluation, and the method here is to evaluate the new remote control in terms of the user requirements and the hot trends introduced by the marketing department. So, this means we're going to go over the priorities that were raised by uh the consumers a as well as incorporate all of our insight into this uh evaluation exercise. So I'm going to go and use the whiteboard, and I've made a list of criteria to look at, and so I'm gonna I'm gonna leave this up as the last thing, but for the evaluation it's going to be one is true and seven is false, going over these different criteria, so one true seven false and I'm gonna now use the um the board. Okay. So um fancy, technologically innovative, easy to use, trendy, buttons, excess buttons, good buttons, ugly, sellable, and other. And in fact I hope that uh you all introduce some additional terms, because these are things that um have been brought up, some of them seem rather close, like they overlap. Mm, yeah, price. We'll put price up at the top. Um Okay, so Did you say? Uh okay, so wha how do we feel in terms of is this fancy? Mm-hmm. Mm-hmm. I yeah, so in that respect I think we'll go with that respect. Yeah. Elegant. Yeah, no these aren't the exact terms that the um Yeah. Elegant. We're gon let's use elegant, although the the the people, the word on the street is is Yeah. N that um yeah uh the uh is fancy. So let's let's take it to the next level. Well okay, so in terms of elegant, fancy. we'll call it E\_F\_ um, do we do we think that perhaps and maybe we should say the yellow? Should we go with the yellow in terms of I think that's a really superior they're both Yeah. Yeah. Yeah. As a banana. I think that many of us are abstract enough to look at the yellow one and say we'll call it the banana. And of the two I really like I m I like the banana, but I I do like the chunk. No, but I mean in terms we have to evaluate one of them. Unless do you guys wanna evaluate both? Okay. So we say true. Um technologically innovative. Yeah. So we'll say we'll say uh false. Easy to use. One, is that inappropriate? Okay. Oh, pardon me. Um trendy, s and I say specifically spongy fruity. Okay. Okay, so

two? Um are there excess buttons? That is false. Um good, well designed buttons, intuitive buttons. True. Ugly. People don't respond well to ugly. Sellable, uh quirky, you know, something people like oh, yeah. Yeah, I do too. Oh yeah. And I was I was thinking of other things um in terms of uh could we say it's cost saving? With the Yeah, with the energy. It is going to be kinetic? Yeah, we'll c we'll say it's a cost saving enviro. Uh so yes. Well you're still in the Play-Doh stage. Anything else? Including price, do you have any idea about price or other features? Okay. So true one or should I go to two or three? Okay. Um other? Anything else you guys can think of? And I'm gonna actually change a couple of these so then I'm gonna instead of ugly I'm gonna say it's attractive and then make that true, so that 'cause I have to do an average. And then um excess buttons. Exactly. Wow we're doing really well. Yeah, be you know, so it doesn't ruin the polarity. Mm-hmm. Or L\_C\_D\_. Yeah. Well if you g uh let me know if if any of these um if you if you all can think of any other um thing to change here if you th if you think I should change the innovative or add other features. If not I'll average those. Okay. Mm. So Um okay, how about if I uh pass this back to you and I'll uh figure out the average here. Thank you for everyone's help with that. One, two, three, four, five, six. Yeah. Sure. Yes. Yeah. Yep. I think with the marketing element of uh fruit shaped I I mean I that really opened my eyes. I I only speak for myself though. Yes. I can give you a number, um it's uh the average evaluation score is one point eight eight, so it means w you know, I can I can spell it out. There were six true or ones, four um pardon me, two s almos

t true or close to true, so that was four points, and then uh one false, seven points, so seventeen divided by nine we're between one and two. I would say that's ex excellent in terms of uh ho how much we adhere to the ideals of the uh market place. To maintain old technology, exactly. Yeah, yeah. Yes. Okay. Nice. So we might have to wait. Yeah. Um I one thing I want to do is oh, I think the meeting's done. Yeah. Um one thing I wa I wanna do is save everything in the right files, because I don't think everything is saved. The right files. Final meeting market I keep forgetting whether I've done this.. Yep. Ta-da. Right. Mm-hmm. Um well I don't have very much to add. Um the the case oops, that's the uh on off button just come off our prototype. The the case can be either um spongy rubber or hard plastic. We're not absolutely sure about a combination of the two, but it can be either of those. We have the technology to do that. Um and as for the the actual components um, uh Steph just said this is a quite a cheap device to manufacture. We have simple rubber push buttons um which provide all the functionality we need. Um the um the diode that actually does the um infrared is at the end, it's the stalk of the banana, or it's just the thing at the end of this version. Um so that's for material. Colour, well uh Steph's the expert on colour. Um we we don't have any particular restrictions on that. Yeah, I think that's all we've got to say really. A banana. Would you care to examine the prototypes, see how they feel in the hand? Yes, that's so that your index finger automatically goes straight to it. And it was partly we thought the design looked better, but it could be moved if if marketing feel it's important to have the on off button in a different place. Hmm. And it's a very simple design, there's not a lot to wrong, the components are cheap to make. Mm-hmm. Yes, a plain, simple, clean design. Well we have got s trendy further down, but Elegant, I don't know if I'd call them elegant. Stylish, yeah. Yeah, I'd I d I don't think that's what we're aiming at with this concept. I think we're using simple components that are gonna be robust but not particularly innovative. Very. Yeah. We have the worry about how robust it will be if it's it's curved as a banana but spongy. I think yeah. Yeah. No. So that's false. No. Yeah, I think they're different, aren't they? Mm. Yeah. Yeah. Well I think our instinct is that it should be pretty cheap to develop. We haven't got a lot of expensive components in there. I'd put it at one I think, but I dunno, what do you Yeah, true, it might be the yeah, yeah, true. True. Yeah, that's a good point. Right. Yeah.

That was the crank, wind-up crank on the side. Just one. Uh uh yeah, I think we can do it all with simple. Just checking that. Yeah, simple, 'cause we've just got push buttons, so we can do it all with simple which is the ch should be the cheapest. Yep. Yeah, that that one is single curve, isn't it? Um do we have I I think you it means you reverse the curve. Yeah. Yeah, I do I don't think we need that for either of them, you can do a banana in single curve, yeah. Yeah, can we do some what ifs, 'cause it may I mean I I still quite like the idea of combining plastic and rubber myself, but it depends on the cost, I guess. Yes. Yep. Do we need to say how many buttons, or or d is it just one? 'Kay. Uh they'll be rubber, yep. Actually, does tha does special material mean that plastic is not a special material? 'Cause I think they can be plastic. Yeah. They could be plastic, we don't have to have rubber buttons, because we haven't got a double curved case. It's just one, isn't it? What, we're in. More profit. Do you do you need to double click on that to open it? Yeah, yeah, the Play-Doh was best, I thought. Yep. Yeah. Yeah, I think we're a good team actually. I'm not sure all the wires are really great though. I thought so. Yes. Yes. Oh hang on, we haven't heard. Mm-hmm. Absolutely, and it's kept us within

budget. And then we get the product launch party. Product launch party? Absolutely. Um almost, there's one more thing I have to get out of the I have to make sure that this attachment will open. Ah-ha. Okay. We'll open that when the time is right. In the meantime Closing things down, okay. Let's see what this thing does. Does it come up together or disappear one of them or what? Ah, we came up together, we're good. Okay. Are we ready to start? Okay. It's now quarter of four. This is a f another forty minute one so it will end at four twenty five. Okay. Right. Our agenda is, as before, for me to open the meeting, for us to go over the previous minutes, then for the two of you to present your prototype and for you to g um Sarah present the evaluation criteria. We then have a finance aspect, which is a spreadsheet, an Excel spreadsheet. And I know what you're all thinking of, oh my, um because we're only given a forty minute time period to get it all in, including the production evaluation. So we're going to make a very fast track. Okay. Um and as you can see that's what we do next on this thing. So the first thing I have to do is close this so that I can get to Where is it? I need to open mine. Not the agenda. No that th I want the minutes from the previous minutes. That should be there, minutes. Yeah. Okay. Uh from meeting three, is it alright with you if I don't switch it to show, just use it as is? 'Cause this way I can more easily flip it. Okay, um obviously all of us were here for the last meeting, we reviewed the previous minutes before that, um each of you made your presentations. Um we discussed the various possibilities based on what was presented in those presentations. The market trend of fruit and veg, mm spongy, uh fancy and elegant more than technologically innovative and that more than easy. Um we decided chip on print would be used. Um we would use plastic with a rubber casing, I think was the consensus, powered by kinetic energy. There was no decision made on the curvatures or double curvature or straight. Um perhaps the prototype will give us an inkling of that. Um looking like a scroll, but it's really a push button technology, excuse my spelling um that was actually in use, that is uh behind the scenes is push button which we uh according to Kate have a very good uh grasp on doing that in production. Um we decided that separate fashionable covers covering your fruit and veg might be a separate product that could be suggested to management. Um and as suggested um yellow with black buttons with the company logo, a slogan and image might be a good idea based on the requirements that have been provided to us. Um we did have a few production issues and coordination of the various bits and we had some conflict of ideas and cost constraints and we ran out of time. Um we had to follow that up and prepare for the last one. And uh we closed as it ran out of time. Is that a fair presentation of what happened? Okay, back to this meeting. Um we're down to the prototype presentation. Over to you. Ooh, two. Ah. Uh-huh. 'Kay. Okay. Okay. Mm-hmm. Mm-hmm. Oh I see, the on-off's in the back. And

then you can use your thumb. I could see this thing, unless it's reinforced, having a problem with the you know yeah. Hmm. Okay. The next item is evaluation. Uh if that's if you're finished. Oh sorry. Try again. Hmm. Well we will soon, unfortunately. Come on. No., Elegant. Elegant. Mm. Yeah. The chunk. I think between the two, somewhere between the two is true. It's more true than false, about a two. Mm-hmm. Trendy. Mm-hmm. Hmm. Excess buttons. No. Better, more intuitive buttons, yes. No. I like it. Mm-hmm. Yes, the instinct says true. Yeah, that's not a cheap thing to get. Hmm. I think we're good. Okay. We're a little over halfway through the meeting and the next big thing is the finance. Okay. Yep. Right. Right. And as you can see it says the same thing, it had not lost itself, thank Goodness. And we're going to raise what's called a

sp a spreadsheet that they provided to me. Um and it says fill in the number of components you plan to use in your device. Hand dynamo, battery, kinetic, solar cells. Okay. Yeah. Um what's a hand dynamo? Oh shoot, forget that. Kinetic is um and how many of those will we need per we only need one. Okay. Electronic simple chip on print, and we'll need one of those. Okay, and we only need one of those. Okay, the case will be uncurved and flat or a single curve or a double curve. It looks like it single curve, 'cause of th the chunkiness. It's that's uh uh one. And that's uh that's the the one that goes like this. Right. No, single curve. Okay, case material supplements. Plastic, wood, rubber, titanium, special colour. We had the special colour. And did we say plastic? Yeah. Okay. We'll come back, if we can, to the rubber being added at the moment, that's where we are. Interface button push button interface. That's what we're using, isn't it? Whoops, don't want that, not yet. Um No, it just says push button interface. Button supplements, they'll be in a special colour of black. And the buttons Wha what is the buttons made of, rubber? So we need one of them. And are they any special form? 'Cause the rate we're going we can put the rubber on top. Oh. Okay. Um let's put that rubber in then, of the case material supplement. Uh we only need one of them. Um and the total cost has been calculated as nine Pounds twenty out of the twelve and a half we were allowed. We're in. That's us. Okay, I'm going to save this into our desktop, project documents. Okay. As our project document bit. Yeah. There we are. That's the only Excel document that will be in there, so it's there for all of us. Okay, so, are they under twelve fifty? Yes, go to the project evaluation, next slide. Right. Um the project process, satisfaction with, for example, the room for creativity. Yeah, leadership, teamwork, means, of having whiteboard, the digital pens and all that kind of good things. Uh-huh. Okay. So, we went over all those things and we're satisfied with all the above. Um did we find any new ideas? So we actually worked well as a group. Right. Are the costs within the budget? Yes. Is the project evaluated? Yes. Uh-huh. Mm-hmm. Alright. And we've therefore we have to do the final questionnaire and do the meeting summary, I have a final report to present, um and then we're done. We done good, and we're finished in time. I believe that is the end of our meeting. Thank you, Melissa.

# Meeting ID: 74

Data Source: Train

## Executive Summary

The Industrial Designer presented options for each component. He suggested kinetic energy, a titanium case, and rubber push buttons. The group will ask if the kinetic energy component can provide enough energy. The User Interface Designer introduced the graphical user interface to the group and suggested using an LCD screen. He presented several existing products and suggested the following: large buttons; voice recognition; either push, scroll, or spinning buttons; and incorporating some customizable components. The group discussed including a help button; it was decided that it would make the device seem more complicated. The Marketing Expert presented that users found remotes too easily lost, complicated, and ugly. He showed that users were willing to pay more for a fancy remote. He suggested the LCD screen; the group felt that it was better to utilize the user's television as a display screen, but that they would inquire about cost before deciding. The group will inquire about the cost of voice recognition and scroll buttons. The group discussed incorporating a locator function and customization for children. They discussed the sensitivity of the voice recognizer to other noises; the group will ask about the capability of the recognizer.

## Complete Meeting Transcript

Okay so I think I will do my presentation on the components concept so can you please uh open uh I'm participant two. Components design. Okay so uh the first thing uh I have done is to to made a review together with the uh manufactural uh department and have which components was uh available to build a remote control. So for energy sources we have we have to choose between the solar energy, hand dynamo and uh kinetic um well uh kinetic uh technique to to store the energy. We also um we also can put a regular battery in the in the remote control. Now Yeah b uh f well uh I meant uh by by battery I meant uh I will not have a uh a wire between the remote control and the energy source but uh I didn't fou we didn't decide yet which kind of battery we will put inside the the remote. So uh it's a point to discuss. Then uh the case material we have uh uh also several choices, like wood, rubber, titanium or latex. But uh well it's not a a re uh well a real issue for the from the technical uh point of view. Concerning the interface uh we can we can put mm just simple buttons or scrolls or buttons uh much

more complicated, but it also requires that the chip to process the button is more complicated so. And uh this is the last point, the choice of chips. So what I have found is that I think basic battery or kinetic uh energy uh collection is the better way to provide energy because I think solar energy won't work in a cluttered uh environment. So um so I think we can start with these two main things. For the case uh well uh I think that uh titanium is um is a good choice because it's trendy and it's uh it's uh well it's modern and uh user are are mm will be uh very happy to have a a nice remote. For the interface uh I think that we can achieve uh all the desired functionalities by s just uh using uh rubber buttons, simple buttons and thus this allow to use a regular chip that are uh well cheaper. And s so uh we can move to the next slide. Yeah. Well uh uh i it's uh it's the the shape of the um of the remote. You you will have the well um the the curve will fit into your hand when you grab the Yeah. It's more comfortable that if these uh it's completely flat. Yeah the um that's the point. The kinetic one is uh y you can recharge uh by the um Yeah and by well by just by moving the ar uh your arm the mm well the remote will uh accumulate energy. But I d I don't know it's if it is feasible because I don't know if yet if the user will move enough to provide the remote um all the necessary energy. Yeah. And yeah and so can you go to the next slide please. So and uh that's uh that summarize well what I have said. So uh you're right we can uh see in our uh R\_ and D\_ uh if the kinetic metal is sufficient to provide enough energy. That's it. Oh yeah I take care, it's all right. All right. Yeah. Yeah. Mm-hmm mm mm. Yeah fine. Yeah. S a good idea. Yeah. Yeah. Yeah but uh as Norman say if uh there is uh already a commercial product available who t who do this we we can check uh to integrate it i into our uh new remote control. Yeah yeah. Hmm. Yeah. Well I I think you it's it's fine you have uh reviewed all all the possibilities but uh uh well uh i if we consider that uh the user interface is displayed on the T\_V\_ screen I don't think we need uh we need much buttons in the remote since we we just have to navigate and to have a okay or enter key or things like that, because uh adding wheels or scrolls uh makes the thing more complicated and more expensive also, so. Yeah. That's a good idea. To have a help button. Yeah. On the T\_V\_ screen. On the T\_V\_ screen the uh how to use your remote. Uh yeah. In a marketing point of view. But uh well I think Uh well. So let's see what uh what people want. Yeah. Yeah. Mm, the functionalities yeah. Yeah. Well mm well I I don't really see the advantage of having uh L\_C\_D\_ on the on the remote control if we have a a big screen and uh display on the screen. It'

s yeah of course it's fancy trendy and so on but it's expensive to produce and it's not really Yeah. Yeah yeah. Yeah but when you play with the iPod you don't have a big screen in front of you, s Yeah. Yeah. Yeah yeah. So I th I I well I think we we can focus on the uh on the fancy look on the uh on the speech recognition if the technology is available but well I think L\_C\_D\_ will uh will uh make us spend a lot of money for not so big results. So price of uh L\_C\_D\_ display. And Yeah. Yeah okay. And Well uh compared to the to s the simpl simpler simplest button. Yeah. Yeah I think that Yeah I I I think that uh well uh as we have seen in the in the presentation uh well uh about uh uh fifty percent of the of the percent n choose the button so uh I think to have uh five uh simple button is sufficient for our functionality. Yeah. But But the uh the thing is is i is that we can add a functionality on the on the T\_V\_ screen like uh a a list of function and then you choose with the with the button to well you navigate and you Yeah. But if i i if we if we could have a a a display uh g a user interface that is very complete on the T\_V\_ screen I think that just five buttons are sufficient, one to go up left right down and uh enter and you you just select the functionality you want to access or things like that. You don't have to switch to a channel to another uh Yeah but Yeah but if you look at the L\_C\_D\_ you you don't look at the T\_V\_ screen so i i it's not really worth to get to have the image if you don't look at, so. Yeah. Yeah.

Yeah. Well so we we can think about a well a a vocal command like uh find and when the remote control uh hears fine well yeah just uh to make him beep or t Yeah. Yeah. Put Yeah. And that's a good idea, that's simple, like in phones. Yeah. Yeah. Yeah if there if there uh there is nuff not enough battery. Also and uh uh the remote is lost. Yeah. Okay. They were ugly. They Well the last one with the um yeah with the two parts was uh original, so Yeah. Yeah. Well we can think about uh having uh on the on the on the user interface when you switch on the T\_V\_ you can uh well write a code or choose a category, if it is kids, uh things like that. So for mm yeah. So for my part I will check the prices the um the prices difference uh of what to use, where to use, and s uh and so on. Yeah. Yeah. Well I think we can we can have just numbers for channels and you can say to your remote control like uh sports and then on the T\_V\_ you have a list with with uh uh well with sports program playing now and and uh That's right, yeah, yeah. Well but well e every possible word uh has a probability to come about of the T\_V\_ so. Yeah yeah. Yeah but well okay. Yeah yeah. Mm mm. Well I Yeah. Well I uh I also I I also think about uh another problem, if if there is uh more than one person who is watching T\_V\_ the s well the the speech uh r recogniser should be able to distinguish between the two. Because uh I remember when I was a young child with my sister we yeah we always want to w to watch different emission at the at the same time so it's a pr it could be a problem if uh if well if someone passes by when you are watching T\_V\_ and say oh T\_V\_ thirty and just run, s Yeah, yeah. Yeah. Yeah that's well I think that's a good uh a good option because it's simple and uh simple to implement also, so. Okay. Okay. So I see ya. Mm. Mm. Mm. Sorry. What is this single curved what does it mean? So it's it's not Yo I yeah. When you hold on it, it is comfortable to hold. Okay. Yeah. And the battery, is it kind of a rechargeable or it doesn't matter? That that's what it means by kinetic. Okay. Mm-hmm. Okay. Mm. Mm. Okay. Yeah. Yeah. We we might check with our R\_ and D\_ department to see if they have this product ready for market. Mm mm. Wha Ah the department. Mm. Uh So I um keep in touch with the R\_ and D\_ department. So the titanium case is the normal case that I'll show you some pictures that I have and you tell me whether they are tit

anium case or not. 'Cause I am not very sure, plastic, titanium or whatever. There's another point I want to make, is that the uh well you've seen them I le na my presentation that um I point out some why buttons are not the mm not the only ways you can use Yeah. Yeah, maybe n Yeah. So the user interface is uh i it uses the aspect uh of a computer system, a programme which can be seen or heard or otherwise perceived by the human user and the commands and mechanism the user uses to control its operation and input data. So you s this gives you the ways to input data and we have uh we are more we emphasise more on the graphical user interface here. The idea is to represent buttons as figures, diagrams, symbols and on so you you can easily when you look at the symbols you understand what it is doing. Yeah. Yeah. So. Ea easy to use. So next one. function five. So I can use the button, the mouse maybe. Yeah. So next line. So the here are some examples. So they cluster the buttons together. They group them into col they colour them and uh they have different forms as well. Mm but this interface are kind of confusing. Uh basically there are too many buttons. Right. Next one. So some people are propose voice recognition and so ah by the way I receive an email from the from one our departments saying that the voice recognition has been used in the coffee machine for this by a company when you tell the you say good morning coffee machine and the machine are reply to you. So I just got an email saying that. And it seems like this voice recognition technology is ready to be used so we might consider that, supposedly. The next one. Mm so somebody some people use uh some people use a spinning wheel th with the L\_C\_ display so instead of using the mm buttons you have a L\_C\_D\_ screen and then there you can u you can use that as buttons, you can use that as real so so that could

be an option as well. Touch screen, I mean. Next one. And some people propose a scroll button. Integrated with push buttons or you may have scroll button instead of just the push button. Like the one we have here. Uh, next one. So mm so there are a few aspects that I collected here. So s basically this deals with special users, children, handicapped people, old people, and uh mm and prog basically they are programmable, specially for children. And uh mm yeah yeah. And then they also secure uh covers, to protect uh secure and hidden programming and battery covers that will protect your settings. So But we don't have to integrate all these complicated features. I'm just saying that the currently in the market there are there are control there are remote controllers f customisable for different people. Yeah, so that's the point. The next one. And uh you see this is the one where you have the protection cover. Mm maybe useful for children, they might you you they only see the buttons outside. And for adults wh where you have more control you can see the one inside. So the adults might wanna have a key to lock that to pr so children will not touch the button inside. Yeah. The next one. So this guy this is another company that provides big buttons. At I see that that is useful for old people and then you don't get it lost. But for our product we don't need a big one because you have voice recognition e eventually with use. And you can call your remote controller if you don't know where it is. T\_V\_ remote controller where are you? And then, he will beep and to say that I am here, for example. Is it possible? Uh? Yeah. Yeah. Yeah. Yeah. And uh, this is another one where you can uh the the the part that's a V\_ standing for the volume. So there's a up arrow and a down arrow. But you the see that in the V\_, the V\_ appears to be the down arrow on the top on the top up arrow if you up arrow there's a V\_ like as as if it's turning down so it's confusing interface, so I wanna avoid this kind of thing in the design. And here are is uh here is a s short summary that I summary that I c

omplied after the findings I found. Big buttons are convenient, voice recognition helps, push buttons, scroll buttons, spinning wheels can be used as navigation tools. And uh user customisable is important and finally simplicity simplicity is the key. Yeah. So we have many concepts there but we have to choose later on which ones are important to be used. And basically uh Yeah. Mm-hmm. Yeah. Mm. Mm. Okay. A help button. So you are display on the screen. So on the T\_V\_ screen. Okay. Okay. Okay. So that eliminates all the complicated documentation, okay. So wi Yeah. Mm. Mm. Well uh what I s propose is that uh you know a remote controller, i it could be a cube, is uh a small device that uh looks like a cube and maybe you can just change the um the buttons, if you ch turn one side you get one one buttons, you turn the other side you get the other buttons, so for maybe new generation people who get used to the computer they want lots of controls. Small Yeah. Let's see the market demand. What what market yes yes. Yeah. Yes. Yeah. Mm. Oh. Big screen. Yeah. Mm yeah. Mm. The thing Yeah. Yeah. Yeah. If you re-use the existing screen, we element eliminate the L\_C\_D\_, after all the L\_C\_D\_ just to display and if you have the colourful screen you can make the display colourful, fancy, as fancy as the one on the L\_C\_D\_, maybe even better. So Yeah. Yeah. Yeah. More on a fancy design. Yeah. Mm. Remember we have a s budget for the cost of producing the remote controller. Yeah. So i is so the thing is you can find out how much an L\_C\_D\_ will cost and then we'll decide again. Uh maybe you can find out the price and tell us next time. Is i if i Yeah. Yeah. And also the cost for the speech recognition. Ask our R\_ and D\_ department. Yeah. Yeah. And ho Yeah. And also the scroller button, how much will it cost. Yeah. Don't use the buttons. Yeah. Yeah. Yeah. Yeah. Important. Yeah. Yeah. Mm. Yeah, yeah. So so the at most more power uh. Yep. Yeah. Mm. Mm. Yeah. Yeah. Mm. Mm. Mm. I if Mm. Mm. Yeah. I think that there's no contradiction here, because if there are few buttons, you don't have to look at your your controller any more because you know where the buttons are, so if you wanna control the screen d sh sharpness you just say sharpness and then you t turn you just press lef increase or decrease

button and the same for the volume and the channel, if you had the speech recognition there you just shout your channel, just tell your channel and then you don't even have to look at the button at the controller so finally that will eliminate the need for L\_C\_D\_, with the help of speech recogniser you can Yeah. Mm. Mm. Mm. Yeah. A and Mm. Where, yeah. Yeah. Mm. Put it back at the charge. Yeah. Yeah. Mm. Hmm. Mm. Th yeah. Mm yeah. Yeah. Mm. Mm. There's mm. Mm. Yeah. That we can what we can do is we can program a function whereby when you press the switch off T\_V\_ button, the off button, the remote there be s uh instruction on the screen, please charge charge me. You never get it lost because uh every time you're off the computer the T\_V\_ you are asked the the command the T\_V\_ com remote controller would tell you to put it back to where to the charger. Yeah. So you will never get lost yeah. Yeah. Yeah because everything is programmed inside. So it's it's uh it's all about strategy, y Mm. Mm. Yeah, yeah. With uh two two two parts controller. Yeah. Mm. Mm. Mm. Mm. Mm. Mm. Yeah. Mm. Mm. these are probl yeah. Mm. Mm. Mm. Mm. Mm. I think we need to define also a s the set of vocabularies for the speech recogniser because uh if you want uh say we can sort by channels or sort by T\_V\_ programs, you have to decide a category of vocabularies for them. If numbers, they're easy, but if name the channel by by name Mm. Mm. Yeah. Mm. Mm. Mm. Mm. But I I I think that the user would like wou would like to associate the channel or call the channel rather than than the numbers. You say numbe channel number five of the T\_V\_ correspond to something else in the channel. So som

e people may want to say, I want to see this channel. Yeah. Check with the v R\_ and D\_ department the capability of recogniser. Uh? Well, it's convenient for the user. The uh uh mm. Mm. I I think that I have mm mm I think there's another way you can do is that uh you can uh if when the user ch press a button to choose the channel for example, then what you can do is that the you can make the T\_V\_ screen to split them into small little little squares of images where you you you have a snapshot of every channel, so let's say it's a four by four matrix of the images, so now what you do is f looking at the all the sixteen channels available at one time, you just use the control button uh, you just you you just choose the the option you want and then you just hit the button and then you go to that channel. So Mm. So you you don't use the speech recogniser in that way. Oh, okay. Yeah. Mm. Yeah, I wanna watch this, I wanna watch that. Mm. Mm. Mm. Hmm. Well, you you stay a five minutes. Yeah. Yeah. Oh. But people are often enough looking at the help, once they see the help button they say oh this is a complicated stuff. It's a psychology. Okay. And let us see what the market demands. We could just go to my presentation. Yeah that's right. I mean it just showed us the remote with an cap which could be used for kids and if you remove the Same remote with some Both yeah. And then we can decide what what we can yeah. So we just made an marketing survey of what people need from our remotes and how it could be special from the other remotes. And we got the best on the responses from the questionnaires. Uh we also have some prizes for the most creative solutions. And we found the following solutions which we could which would be helpful for our design. So seventy percent of the users, they find their remote controls very ugly, they don't find it pleasant to use in the size or usage or anything. And eighty percent of the people they are always I I mean they are willing to spend more money if the remote control would look fancy. And the current remote controls do not match well the operating behaviour of the user. And seventy five percent of the users said they zap a lot. And fifty percent say they use only ten percent of the buttons, so the rest of the ninety percent of the buttons they're not used most of the times. So this were the findings which we found. And also they cited frustrations with the present remote controls. Most of fifty percent of the time the remote controls are lost somewhere in the room and people are always searching for them rather than watching the T\_V\_.

And by the time they found the remote control the program is finished. So they're frustrated a lot And um if the remote control is too complicated it takes much time to learn the functionality of it. So you can just see the percentage, fifty percent people they responded that they always lose their remotes and thirty four percent they say that it's quite difficult to learn if it's too complex. So keeping in view all these findings and the frustrations I think this should be the solution for them. We should have an L\_C\_D\_ on the rem remote control. Mm-hmm? I mean as our survey says that people are willing to pay more if their remotes are fancy. So if we have a L\_C\_D\_ on the remote, rather than looking onto the T\_V\_ you just look into a remote and navigate it. It's the same menu as we have saw that iPod remote control. We just play around Yeah. Yeah. I mean this were the points which we got from the market demands. So the other one Yeah that's fine. Yeah. I mean that's Mm-hmm. Uh yeah we have uh I mean that should be found out by the Industrial Designers. And it's always good to have an voice recognition for the remote controls. Yeah it's o only for a limited vocabulary, say eighty commands or so. Mm, the scroll button, from the survey we never see that people would like to have some scrolling button. Because they they just they're just frightened to use the scrollings o

r help button. Yeah. They're not used much. Or it could be like this, as the people say, if they have a L\_C\_D\_ on the remote not on the television. Because when you have the L\_C\_D\_ onto the television screen you miss the picture in the background, we are most focused on the commands. So if you have then L\_C\_D\_ in the remote, you just have a menu, and increasing and lower these signs here to change the programs and this menu when you press the menu, in the L\_C\_D\_ displays as you go on pressing the menu it faster displays volume, then the program, then the brightness, contrast and all the stuff. And accordingly you can just increase or decrease. Yeah that has to be checked out. Yeah. Okay. I mean, better if we could just check all the cost with L\_C\_D\_ and also with the speech recognition. And then we could find which would would be a more suitable in this case. And the third problem was to find the remote control. Always, so fifty percent of the people say they lose the remotes. So Yeah that's right, that's exactly what I mean by voice commander. Or it could be also something like this, uh it's always boring to change the batteries of the remotes control, so we have some one charger there and whenever we don't use the remote control we put it in the charger. And when we're using that t remote and if we misplace somewhere, in the charger we have a small button, and just by pressing the button in the charger the uh remote control beeps, wherever it is. I mean it doe it also doesn't require a voice command, because there are problems with a voice command. Yeah, yeah, yeah. I mean charger would be fixed because it's always with electricity plugged. Yeah that's right. It's an good reminder, yeah that's right. And of course the final point is a fancy look. As we have seen earlier the remotes which were displayed by Norman they weren't fancy, I mean mm very big or something with lot of buttons. I think we should have something it I mean uh I mean uh I mean uh you see if it's like that even a kid who wants to have a control he could just plug it and use it, you can't avoid him. But you can have an button for child lock. So just by pressing the button with some code, you t you put a lock onto the remote, so that he can't use even Mm uh That's right. I think these other four points they're the market demands and so it's for the user interface design and industrial design to just think Yeah I think it should be clearer for us in the next meeting that th uh these could be included. No, we have a problem there. You see uh if you have a voice commands and you are s you are watching a score on uh basketball score or something, and if the score comes twenty four thirty five, you've just say twenty five and suddenly the screen the channel goes to twenty five. So I think there should be a prefix to some numbers I mean the the you just check all the probability that saying T\_V\_ twenty five and just ordinary twenty five. Ordinary twenty five you almost there's a probability of being said around sixty seventy

percent and T\_V\_ twenty five I dunno it will be round about one or two percent. So it's better to have some prefix before the number. Yeah something, some code. That will be too big. And it will be difficult for the vocabulary also. Als might be you just forgot the channel name, you kno only know the number. Then Yeah, the. Yeah yeah,. Yeah. A and in the same lines we would have a one more problem. If we are using the television in the different environments, say in the factories or in the shops where there is a lot of noise and this voice commands if they fail to work, that would bring a bad name bad uh reputation for our company. So I think we should specify some pre-requirements if we want to use a voice commands, say that it should be used in an silent homely environment or s something. Yeah that's right that should be an option. I think these are the practical problems. So we need to take care of them in the design. Okay. Oh it came there

on three minutes back so we are I think we can just press the okay. Okay. See you another thirty minutes. So we come to the third meetings. I have good. Um so in the last meeting we have discussed the functional design and now we will talk about the conceptual design. So we will talk about some specific details. This Uh this is what we have decided in the last meeting. But if we use battery We will, okay. Three. What's the function of this button. I think it makes the the interface really Graphical user interface. A graphical user interface emphasise the use of pictures. Yeah. Mm-hmm. We should include speech synthesis in this case, no? Mm-hmm. Or maybe we can include the user manual in the in the remote control and we should have just a button like help and you say uh and you ik you press the button help and maybe you see the the user m might in the in the T\_V\_. Yeah. On T\_V\_ T\_V\_ screen. So just you push the button and we will Yeah. If the if No In the case where they need help, in the case where they need help. Yeah. It's just for user customizable, for kids or old people. So So it's the same Can be used by both kids and old people. Maybe for kids, kids they like uh t no I they like to Yeah. Mm-hmm. You can use this screen instead of the big se screen, instead of use the yeah. Hmm. But Yeah. Mm. It's for it's just for small vocabulary. We it's not yeah. Yeah. Yeah. Push push. It doesn't mean that the other buttons are not necessary or important. But they are just less used compar yeah. Or maybe we can u uh or maybe we can uh make this the ten percent of button more bigger than the others. So. Mm. It's And I think it's increases the cost of the the remote control if you use L\_C\_D\_. I You will listen to a peep, special peep. Okay. Yeah. But you don't you don't have to move the the charger. You have to keep it. Okay. Maybe for some people lazy people. Yeah yeah. Mm. Or Or maybe you have to to show some specific programmes for kids and then just just yeah just push uh kids button so it's automatically. So if he. Yeah. Mm-hmm. Yeah it's yeah. Mm-hmm. Or just It's difficult to to just say the the name of the channel. It will be difficult to say just the name of the channel. Because you have to s t uh a ch yeah but you have to to have all the name of the channel in your vocabulary. Or maybe Or maybe the user can create his own vocabulary, just pronouncing the the name of channels and include in the vocabulary. Or lets the user create his own vocabulary of channel. No. Just you have uh in the beginning you have uh t you have to train you have to create the vocabulary by yourself. By associating each channel with the name or And for each one has his own. Or you have to s Yeah. Mm. Or we can switch on or switch off the the special, yeah. Maybe we'll discuss them in next meeting. It's time to close this meeting. Yeah. Okay. Thanks for your collaborations.

## Executive Summary

Uh now we're going um into the functional design . Then our agenda . first the opening . Uh this time I will take the minutes . Uh you're going to have a presentation . All of you . Um and we've got forty minutes for the whole uh prese for the whole uh presentations . So uh I suggest we take about seven minutes per presentation , and then we can have a little discussion about the new project requirements And then the decision on the control functions uh which we wanna include and those which we don't wanna include . My name is Freek Van Ponnem . I'm We have we uh have been doing research in a usability lab where we observed um users operating remote controls . Uh we let them fill out a questionnaire . Uh in addition we did some market research . Uh see what the market consists of . What ages are involved . these are three quite astonishing results , I thought . uh seventy five percent of the um people questioned uh indicated that they thought their remote were was ugly . Um and an additional eighty percent indicated that they would spend more money on a fancy-looking remote control . Um in addition remotes were not very functional . Fifty percent of the people indicated they only loo used about ten percent of the buttons on a remote control . And fifty percent of the people indicated that their remote tended to get lost in their room . Channel selection and volume selection um both got a ten on a scale of one to ten for relevancy . Then we did some research to the most relevant functions . The power button got a nine . And teletext got a six and a half . Then there are some one-time use function . That uh audio settings , video settings , and channel settings buttons . Which are not really used very frequently , but are still considered to be of some importance . Um channel selection was also indicated to be used very frequently . One hundred and sixty eight times per hour . Um sixty percent of the market consists of users between the ages sixteen and forty f six . the users of forty six to sixty five years cons The make up forty percent of the market . They are not really very interested in features . But they do tend to spend their money a lot easier . What I think this indicates for our um design . I think we should make a remote for the future . And this means we would um have to focus on the age ages sixteen to forty five . Um this would mean we would have to make a fancy design . Um The results also indicated that um about one quarter of the people questioned thought that the remote control caused R\_S\_ R\_S\_I\_ . And thirty four percent thought that it was hard to learn a n how to operate a new control , remote control . I think we should make very few buttons . Uh I think the most frequently used buttons should be emphasised . Especially the channel selection and audio uh selection buttons . But it might be

a good idea to make a docking station . And this would , could get a button in it which would send a signal to the remote which would then beep . So you'd know where it is in the room . And in addition to this it could um recharge the batteries in the remote if you put it in . Then um a surprisingly great deal of people w indicated that um an L\_C\_D\_ screen in the remote control would be preferred . This was um mostly people in the age of sixteen to twenty five . This would also greatly increase the production costs but I think these are just some small factors we could consider . I've been looking at uh the user interface of it . Um f for the techno f functions uh of of it . Um I think uh we uh must use the general functions uh of the uh remote control . I I've been thinking about a simple manner uh to put a lot of functions uh uh in one um in one uh remote control . Uh uh I've do I've uh done a little uh research on the internet and not much information about it , Um about uh interface Uh so uh you've got a lot of devi uh devices like uh D\_V\_D\_ uh uh television , uh stereo . But uh it must be uh user-friendly . you c you can't put a a lot of uh functions uh in one uh Yeah . Uh uh uh Yeah . In one um remote control . you can see , this is uh quite simple uh remote control . but uh This uh re uh remote control got a a lot of uh buttons . what uh I was uh thinking about was um uh keep the general functions uh like they are . like uh the on-off uh button . Uh keep it uh yeah I like a red button . My personal uh preferences um . Use a display for uh specific uh functions of the different uh device . And um here you've got a s kind of a display . It's a touchscreen . you got a general f uh f the functions of the device uh for a D\_V\_D\_ player or uh so um the pl yeah um f for uh playing uh reverse uh . And um you got here uh real buttons for uh selecting uh a device . you you never got uh all the buttons uh on w one device . We better c um uh use uh quite uh large buttons uh Everybody uh have to use it so Uh ol even even old people um young people . we must keep uh buttons uh quite s uh simple and quite large . I think if we are gonna use a touchscreen uh we're gonna go way above the twelve and a half Euros . N I I don't think so . Uh you got uh quite a cheap uh touchscreen . S um it's uh not uh in colour or something . it would certainly make a fancy design . But the It wouldn't be very robust . I've got a presentation about the working design . Um first about how it works . Everybody knows how a remote works . The user presses a button . The remote determines what button it is , uses the infrared to send a signal to the T\_V\_ . The T\_V\_ switches to the frequency , or what function it is . we've got um the the plate . It gots conductive disks for every button . When the user presses a button , a signal got sent , goes to the LED and transmits tranmi transmits its to the T\_V\_ . this is a schematic overview . You've got the buttons . The power source . And uh when a button gets pressed , its goes to the chip . I think we should use default materials , simple plastics . Keep the inner workings simple , Uh I think we should focus on aesthetics , the design and the user interface , and if you use high-tech materials it come back in every product . it's , in my idea , it's uh it's gonna be smart to invest in di in design and not in uh in the product itself . so I'm here to mess things up and uh tell you some new uh requirements . we've uh got to design a um remote which is only suitable for T\_V\_ . Um that's because uh it will be too complex and the time to market will be too big , if we wanna have it uh for more functions . Uh another point is we have to skip the teletext , because in the world of uh upcoming internet uh we think teletext is going to be uh a thing of the past . Another one is uh the customer is uh forty plus . Uh that's the the market we have to to to target , because we are going to develop a new product which is specially designed for the younger customers . And we have to be very uh attent in uh putting the corporate image uh in our product . So it has to be visible in our design , in the way our device works . I suggest let's have a discussion

on the control functions . Uh we can see if we can find a way uh between the functions we wanna use and the market we wanna reach with our product . Um 'cause you're you're saying that teletext is gonna be an old feature But I think if you're targeting people of forty plus , the chance that they will have a T\_V\_ with internet access within the next like twenty years is very slim . In addition people indicated that teletext simply was an important feature for the remote control . So I think it's pretty dumb to put no teletext feature on it . Besides that , I think the market for forty plus is like pretty small . But I mean if I s if I see this , it's I think we're just gonna go for another Standard remote . I think we can do a lot with the design and the simple buttons Uh if we put a lot of effort in those , we can make a remote control with uh just two or three buttons . Or just a remote which is suitable for the market we wanna reach if you look in Holland at the whole generation of forty plus , fifty plus , it's the the biggest share of the of the whole population now . But don't you think that if we make a remote which is uh typically made for this market , that people think the people think that's the the device I've looked for although I didn't realise it . I think that if we're If we put our marketing right um we can sell this just like um I don't know if you've heard about it in the news , the the elderly mobile phone ? if we if we make a remote control just I with that idea in mind , we could make tons of money , I think . We don't have to focus on on on the on the design then but on functionality . Uh I think teletext can be uh um can be a function as well . But only if uh if it won't higher the the cost , But um deaf people need uh teletext for uh for subtitles . I think it'd definitely be a bad idea not to include teletext . Is anybody um really against teletext ? I think that's a good idea as well , especially for the subtitles . I think uh that's very important we have a few buttons . So we can s we can skip the display , But do you need the buttons for one to zero . Think if you're gonna include teletext you do . maybe we can implement the scroll button ? Or a joystick like ? Just look if you look at telephones . The Sony telephone has a scroll button which is very useful in searching names or but um I don't think there are many T\_V\_s that can switch channels that fast . And so you would need like the T\_V\_ would need an a function where you can actually view all channels and scroll through it . If we're gonna focus on elderly people they'll have to adapt . So perhaps we should s stick to the basic layout . I think it's very important in the in the design . You can make a very fancy design uh with putting the buttons on the right places . But I don't think I think if you're gonna make a remote control only to operate a T\_V\_ , you there's not much you can gain on um having as few buttons as possible . you suggest we could better um focus on for example the docking station . I think , mean we obviously need a good way to position all the buttons But I don't think we should spend very much time in that . Do you think the docking station will uh is allowed in the budget we have ? And if the remote stays rather small , it should be possible we're just gonna focus on the extras ? I think so . fifty percent of the people indicated that remote control tended to get lost . So maybe we should implement the audio sign , or something . Like with your key-chain , if you whistle it goes uh it makes a sound . you have it's on some phones too , which have a docking station . And you just press a button and the phone goes ringing . point is the L\_C\_D\_ screen . Uh another Um I don't know if that will rise the cost too much , um I think we'll have to choose between the docking station or the screen , it might be a good idea to have just a little screen on it , which would explain a button if you press it . And it wouldn't have to be touchscreen or a very expensive screen , Just the L\_C\_D\_ . That's a good idea . Few buttons , we talked about that . Docking station , L\_C\_D\_ . Um general functions And default materials . I think that's a good idea as well , Because I think what we're going to design now is for people above sixty , maybe . If we

want um a with uh for example the the telephone for elderly people , we can target the real elderly people . Now you're talking about sixty to eighty for example . But I'd have to look into that a little more . And with uh the little screen in it , which explains the buttons . You could I think we n it would be a lot easier to adapt it to different cultures . In different languages , you know . If we're able to really bring an innovative product . I think since a lot of people indicated that a new remote control is hard to learn , and we're focusing on elderly people here which tend to have a hard time understanding new devices , Um what we're going to do for the next meeting is the Industrial Designer will do the components concept , User Interface Designer the user interface concept , and the trend-watching .

## Complete Meeting Transcript

No. Well I think if we are gonna use a touchscreen uh we're gonna go way above the twelve and a half Euros. But the It wouldn't be very robust. It's very fragile and you can get scratches on it. That's. Okay. Okay I've got a presentation about the working design. Um first about how it works. It's really simple of course. Everybody knows how a remote works. The user presses a button. The remote determines what button it is, uses the infrared to send a signal to the T\_V\_. The T\_V\_ switches to the frequency, or what function it is. So we've got um the the plate. It gets conductive disks for every button. When the user presses a button, a signal got sent, goes to the LED and transmits tranmi transmits its to the T\_V\_. It's a very simple device, technically speaking. So this is a schematic overview. You've got the buttons. The power source. And uh when a button gets pressed, its goes to the chip. The chip uh controls the infrared bulb and perf perhaps a normal bulb. When you press a button you can actually see your pressed button. Well um I think we should use default materials, simple plastics. Keep the inner workings simple, so it's robust. Uh I think we should focus on aesthetics, the design and the user interface, because if you're going to use high-tech materials the price is going to go sky-high. And uh you only have to design a remote once, and if you use high-tech materials it come back in every product. So it's, in my idea, it's uh it's gonna be smart to invest in di in design and not in uh in the product itself. That's it. I think that if we're If we put our marketing right um we can sell this just like um I don't know if you've heard about it in the news, the the elderly mobile phone? Yeah if we if we make a remote control just I with that idea in mind, we could make tons of money, I think. We don't have to focus on on on the on the design then but on functionality. We just change our focus on the project, and I think we can uh we can sell this. No. Uh that's a good idea. Yeah. And besides that it's um If we're gonna focus on elderly people they'll have to adapt. They're not used to using scroll buttons. So perhaps we should s stick to the basic layout. It should be possible yes. If it's not too fancy. And if the remote stays rather small, it should be possible yeah. Yes. So we're just gonna focus on the extras? Yeah. Like with your key-chain, if you whistle it goes uh it makes a sound. Yeah. Y i um I think we'll have to choose between the docking station or the screen, 'cause it's uh Well I don't think they have different television sets uh in uh every country. 'Cause Yeah. Yeah. Yes. Yeah. Okay. No. Yes. Think I'll go first. 'Kay. My name is Freek Van Ponnen. I'm the Market Expert. But you already knew that. Um I've done some research. We have we uh have been doing research in a usability lab where we observed um users operating remote controls. Uh we let them fill out a questionnaire. We had one hundred of these uh test subjects. Uh in addition we did some market research. Uh see what the market consists

of. What ages are involved. Well these are three quite astonishing results, I thought. Um remotes are being considered ugly. F uh seventy five percent of the um people questioned uh indicated that they thought their remote were was ugly. Um and an additional eighty percent indicated that they would spend more money on a fancy-looking remote control. So Um in addition remotes were not very functional. Fifty percent of the people indicated they only loo used about ten percent of the buttons on a remote control. And fifty percent of the people indicated that their remote tended to get lost in their room. So some things. Then we did some research to the most relevant functions. Channel selection and volume selection um both got a ten on a scale of one to ten for relevancy. The power button got a nine. And teletext got a six and a half. So these are the most most uh important functions on a remote control. Then there are s

ome one-time use function. That's what I like to call them. That uh audio settings, video settings, and channel settings buttons. Which are not really used very frequently, but are still considered to be of some importance. Um channel selection was also indicated to be used very frequently. One hundred and sixty eight times per hour. Then these are the This is the market. Um sixty percent of the market consists of users between the ages sixteen and forty f six. Um Main characteristic of this group is that they're very critical on the remote control. Um they like to use new f new functions. But they also are very critical. They won't spend their money very easily. So Um the users of forty six to sixty five years cons The make up forty percent of the market. They are not really very interested in features. But they do tend to spend their money a lot easier. Um What I think this indicates for our um design. I think we should make a remote for the future. And this means we would um have to focus on the age ages sixteen to forty five. Uh this also makes up most the biggest part of the market, so that will also be where our main profit would be gettable. Um this would mean we would have to make a fancy design. Um The results also indicated that um about one quarter of the people questioned thought that the remote control caused R\_S\_ R\_S\_I\_. Um this is certainly something to take into account. And thirty four percent thought that it was hard to learn a n how to operate a new control, remote control. So these are two factors that I think should be included in the design. Besides of course that the remote must look very nice. And the functionality As a lot of people indicated, they only use about ten percent of the buttons, I think we should make very few buttons. Uh this will also be uh beneficial to the design of the remote. Uh I think the most frequently used buttons should be emphasised. Especially the channel selection and audio uh selection buttons. 'Cause they're used most and so they should be robust. They shouldn't break down easily. Um Then as mo as a lot of people indicated that their um remote got lost in the room, it might be and I say might be because it would um certainly boost the uh production costs a lot. But it might be a good idea to make a docking station. And this would, could get a button in it which would send a signal to the remote which would then beep. So you'd know where it is in the room. And in addition to this it could um recharge the batteries in the remote if you put it in. Then um a surprisingly great deal of people w indicated that um an L\_C\_D\_ screen in the remote control would be preferred. This was um mostly people in the age of sixteen to twenty five. But up till forty five it remains feasible. This would also greatly increase the production costs but I think these are just some small factors we could consider. That would be all. Any questions? 'Kay. Yeah you should go to the top thingy. Slide show. Oh yeah. Hmm. Well it would certainly make a fancy design. So That is true. We would have to look into that. Yeah. So is there any discussion possible about the new product requirement? Yeah 'cause you're you're saying that teletext is gonna be an old feature and it's not gonna be used anymore anyway pretty soon. And new T\_V\_s will have internet access on them. But I think if you're targeting people of forty plus, the chance that they will have a T\_V\_ with internet access

within the next like twenty years is very slim. In addition people indicated that teletext simply was an important feature for the remote control. So I think it's pretty dumb to put no teletext feature on it. I'm pretty much against it. Yes. Besides that, I think the market for forty plus is like pretty small. But I mean if I see this, it's I think we're just gonna go for another pretty and not innovative remote control. Yes but it's not the biggest part of the market. And besides that, they're not very critical so I mean they

don't really care what the remote control is like. They'll just pretty much take the first thing they see and which looks acceptable. No. I think that would be the case in the sixteen to forty five age category. because they are critical and they they want to have a fancy remote control. People of forty plus, I mean they want it to work, but as soon as it works it's okay with them. So I haven't heard of it. Hmm. Yes. Yes. But obviously the board tends to disagree. Yeah, also. I think it'd definitely be a bad idea not to include teletext. Yes. Mm-hmm. But I don't think that's really an issue any more 'cause Well might be. But I mean it, if it's only for T\_V\_ you're not gonna need a lot of buttons anyway. You need a one to zero button, next channel, previous channel, volume up, volume down, and some teletext buttons but I think if you only I Nah. Think if you're gonna include teletext you do. I think many people like to use that. 'Cause if you should, if you want to switch from channel one to like thirty five, you don't wanna push the next channel button thirty five times. That's true but um I don't think there are many T\_V\_s that can switch channels that fast. And so you would need like the T\_V\_ would need an a function where you can actually view all channels and scroll through it. And I dunno if many channels would do have that. If many T\_V\_s have that. Mm-hmm. But I don't think I think if you're gonna make a remote control only to operate a T\_V\_, you there's not much you can gain on um having as few buttons as possible. 'Cause I think there are pretty many remote controls that can only operate a T\_V\_, which already only have the minimum number of buttons. I don't think there's much to be gained in that area. Yeah. That is true but I think there's simply not much to gain on the competition when you when you're making a remote control only for to operate only the T\_V\_. 'Cause if you have a a remote control only to operate a T\_V\_ there's simply not a lot of buttons required. There's not a lot of functions required so most existing remote controls simply don't have a lot of buttons either. So I think it would be very hard to actually gain on the competition here. That would that would cost a a big marketing expedition which was one of the arguments to make it only for the T\_V\_ because we didn't have the time to market a lot. Maybe. Well yeah I think, mean we obviously need a good way to position all the buttons and But I don't think we should spend very much time in that. Yeah I think maybe we should do some research into what elderly people like to have in a like to have extra in a new remote control. Yes well fifty percent of the people indicated that remote control tended to get lost. Yeah that was what I suggested. You have it on Yeah you have it's on some phones too, which have a docking station. And you just press a button and the phone goes ringing. So you know where it is. I think since a lot of people indicated that a new remote control is hard to learn, and we're focusing on elderly people here which tend to have a hard time understanding new devices, it might be a good idea to have just a little screen on it, which would explain a button if you press it. Which would tell you what it does. And it wouldn't have to be touchscreen or a very expensive screen, but Just a small screen with two Yeah. But I dunno if that would that would fit into the costs. No. I think probably elderly people would be a little bit more careful with their remote controls than youngsters. Yeah. I think I think that would be a If we should do something like that it would be a, I think it would be really good for uh for the image of the company. And I think, I think there would be a good market for it. If we're able to really bring an innovative product. Yeah the really But I'd have to look into that a little more. 'Kay. And with uh the little screen in it, which explains the buttons. You could I think we n it would be a lot easier t

o adapt it to different cultures. Yeah. Yeah. 'Kay. That's good. Okay. Everybody found his place again? Yeah? That's nice. Okay so this is our second meeting. And uh still failing? Uh now we're going um into the functional design. Um important thing of this phase is that we're going to uh try to get an agreement about the user requirements, technical function design, and the working design. So that we can move onto the second uh phase. But first this phase. Um first an announcement. There's a little adaptation in the air conditioning system. So There's our ghost mouse again. That that means that you can have a little trouble with, little trouble with the air conditioning, that's because of this uh It's in wing C\_ and E\_. So it should be over in a in a while, couple of days. But it's going to be cold anyway, so I don't think you're gonna need it. Then our agenda. Now first the opening. Uh this time I will take the minutes. Uh you're going to have a presentation. All of you. Um and we've got forty minutes for the whole uh pre for the whole uh presentations. So uh I suggest we take about seven minutes per presentation, and then we can have a little discussion about the new project requirements uh which have been sent to me. And then the decision on the control functions uh which we wanna include and those which we don't wanna include. So we've got forty minutes for all of it. So I suggest um let's start with the first presentation. Um who wants to be first? Okay. So Just maybe it's easier if you um Yeah I think you will tell your presentation as well. Just which function you have and what you're gonna talk about. Okay. Thank you. So anybody have um any questions until now? About functional requirements? Okay that's clear. Now to the second. Yeah. Yeah you can take your time. We've got uh plenty of time, so Yeah. There it is. Yeah. One remote. Hmm. 'Kay. Yeah. Okay. Anybody has questions about the technical functions? Yeah. Touchscreen. Huh. 'Kay. That's nice. Uh Yeah. That's right. Uh maybe we can first um listen to your presentation? Uh And then we have a little discussion about the requirements and uh design. I think it's going to Uh it's not too much. Okay. Okay. Thank you. Okay. Uh Okay now I hope everybody has a little bit more insight in the functions we all have and what we are doing right now. Um I'm the Project Manager so I'm here to mess things up and uh tell you some new uh requirements. Um that's, we've uh got to design a um remote which is only suitable for T\_V\_. Um that's because uh it will be too complex and the time to market will be too big, if we wanna have it uh for more functions. So it has to be simple. Uh another point is we have to skip the teletext, because in the world of uh upcoming internet uh we think teletext is going to be uh a thing of the past. And uh it's a function we don't need in our remote control. Um internet is also mentioned in a function we can use. Uh maybe also on televisions it will be available as well. Another one is uh the customer is uh forty plus. Uh that's the the market we have to to to target, because we are going to develop a new product which is specially designed for the younger customers. Um this is uh a bit pity for the Marketing uh Expert. Because he was uh aiming on the the younger persons. So we have to find a market which is above forty plus uh but which will suit our uh remote control, and the other way round. And we have to be very uh attent in uh putting the corporate image uh in our product. So it has to be visible in our design, in the way our device works. And uh we have to be uh very clear on this point as well. So I suggest let's have a discussion on the control functions. Yeah. Uh we can see if we can find a way uh between the functions we wanna use and the market we wanna reach with our product. Um Against the no teletext? Um Yeah it's it is Standard remote. No I think we can I think we can do a lot with the design and the simple buttons which were also ment

ioned. Uh if we put a lot of effort in those, we can make a remote control with uh just two or three buttons. Or just a remote which is suitable for the market we wanna reach because it is forty percent of the market. And um if you look in Holland at the whole generation of forty plus, fifty plus, it's the the biggest share of the of the whole population now. No. But don't you think that if we make a remote

which is uh typically made for this market, that people think the people think that's the the device I've looked for although I didn't realise it. So let's try it. Yeah. Yeah. It's a big success. Very big success. Yeah. Uh. I think so as well. Uh I simply think um uh that the new products we are gonna make, uh specifically design, are designed for uh younger people, uh so maybe we can focus ourself on the elderly people. And I think we have to um see what requirements we need for those um remote controls. 'Cause what you told is the channel selection is important. Volume selection, power and teletext. Okay. Um No we we haven't voted yet, so Uh I think teletext can be uh um can be a function as well. But only if uh if it won't higher the the cost, because I don't know if it will be a lot more money to implement teletext as well, but I don't think it will be a problem. Or is teletext a Yeah. Yeah. So I suggest uh Yeah. Is anybody um really against teletext? No? Just that, that we just keep the teletext. I think that's a good idea as well, especially for the subtitles. Maybe we can make that um another point of advantage in our remote control, if we uh make a k a button ex for example for big subtitles, which is instantly on the remote control. For elderly people they can think, oh I wanna have subtitles, and they push the button and they get the big subtitles. Um so I think teletext can v can be very useful in our advantage. Um Functionality should be few buttons, you said. I think uh that's very important we have a few buttons. So to keep it simple. No. Yeah. But do you need But do you need the buttons for one to zero. Maybe c we can Maybe we can use uh No, maybe we can implement the scroll button? Or a joystick like? There are other ways too. Just look if you look at telephones. The Sony telephone has a scroll button which is very useful in searching names or That's right. the numbers yeah. Yeah they can see how much buttons there are going to be on on the display, and if it's too much we can uh reconsider it. But I think there won't be very much buttons. Or there don't have to be a lot. The number of buttons? I think it's very important in the in the design. You can make a very fancy design uh with putting the buttons on the right places. And if you have less buttons you can do a lot more with To operate only the T\_V\_ yeah. No. So. 'Kay. So we can Yeah. That's right. Yeah. So you suggest we could better um focus on for example the docking station. Uh uh like other functions. Instead of f of less buttons. Mm. No. Do you think the docking station will uh is allowed in the budget we have? 'Cause it can be No. Yeah. Because I think that's uh That's a good advantage point as well. If we have a fancy-looking docking station or very That's a nice requirement. Docking station. I think so. Yeah. That's a good point. Um You said they easily get lost as well. Yeah. So maybe we should implement the audio sign, or something. Yeah. Yeah. Yeah. So audio signal should be possible as well. I think it's not too expensive. Uh another point is the L\_C\_D\_ screen. Um I don't know if that will rise the cost too much, because Yeah. It will be too much as well. Yeah. Based. Just the L\_C\_D\_. Oh just the normal screen. That's a good idea. So Some extra info. Feedback. Yeah. I think that's a good idea as well. As the small screen. Extra button info. I think that should be possible as well. Um let's see what did we say. Mm. More. Should be fancy to, fancy design, easy to learn. Few buttons, we talked about that. Docking station, L\_C\_D\_. Um gen

eral functions Yeah. 'Kay. And default materials. I think that's a good idea as well, because um elderly people don't mind if it's a titanium cover or just a plastic one. So that doesn't really matter. So I think we nee Uh let's um specify the target group. Because are we talking about elderly elderly people or people from forty to eighty. Because I think what we're going to design now is for people above sixty, maybe. Uh what do we want? If we want um a with uh for example the the telephone for elderly people, we can target the real elderly people. Yeah. So that's the Now you're talking about sixty to eighty for example. Yeah. Sixty. Okay. And different cultures. Are we Okay. No. We've got five minutes left just now. Small warning. Should Yeah. In different languages, you know. Yeah. or you have to put a language button in

it, but that will be a bit unnecessary I think. It's better to put it on different markets with it all. Okay. So that's the the target. Uh then a few small things. Uh okay. I will put the minutes in the project uh project document folder. Um what we're going to do for the next meeting is the Industrial Designer will do the components concept, User Interface Designer the user interface concept, and the trend-watching. So just keep in mind the things we've said about the target group, uh requirements, and the trends which are uh going on. And uh specific instructions will be sent to you by uh the personal coach. So um I thank you for this meeting. And I think we have a lunch-break now. So that's a good thing. Okay. Mm. Mm-hmm. Uh okay. Um I've been looking at uh the user interface of it. Um f for the techno f functions uh of of it. Um Okay. Mm? Oh. Uh. Okay. Um yeah. I think uh we uh must use the general functions uh of the uh remote control. Uh uh I've do I've uh done a little uh research on the internet and not much information about it, Um about uh interface but uh Uh Yeah I I've been thinking about a simple manner uh to put a lot of functions uh uh in one um in one uh remote control. Uh so uh you've got a lot of devi uh devices like uh D\_V\_D\_ uh uh television, uh stereo. So um But uh it must be uh user-friendly. So um uh you c you can't put a a lot of uh functions uh in one uh Yeah. Uh uh uh Yeah. In one um remote control. But um Yeah. Um yeah. Got uh many functions in one uh remote control, um but um yeah you can see, this is uh quite simple uh remote control. Um few uh buttons but uh This uh re uh remote control got a a lot of uh buttons. Um uh people uh don't like it, uh so um Well what uh I was uh thinking about was um uh keep the general functions uh like they are. So uh like uh the on-off uh button. Uh keep it uh yeah I like a red button. Uh everybody everybody knows it so uh uh you don't have to change that. Um My personal uh preferences um. Use a display for uh specific uh functions of the different uh device. So um Wh what I was th uh thinking about was um you've got um Uh this the remote control uh and uh you got here the general functions, uh like uh the on-off button uh sound uh I dunno um And um here you've got a s kind of a display. It's a touchscreen. So um yeah you got a general f uh f the functions of the device uh for a D\_V\_D\_ player or uh so um the pl yeah um f for uh playing uh reverse uh. And um you got here uh real buttons for uh selecting uh a device. So um this button is for a D\_V\_D\_ or So um for every um device you've got a uh a f a b a part uh display of a part buttons. So uh you you never got uh all the buttons uh on w one device. So uh that's uh my uh idea about it. Um yeah and Uh let's see. Uh yeah. So a touchscreen. Uh and um th the buttons uh the real buttons uh we have to use um. We better c um uh use uh quite uh large buttons uh for um yeah. Everybody uh have to use it so Uh ol even even old people um young people. So uh we must keep uh buttons uh quite s uh simple and quite large. So uh Um Yeah. Uh yeah. That was uh my uh part of it. So N I I don't think so. Uh you got uh

quite a cheap uh touchscreen. S um it's uh not uh in colour or something. Uh it's just uh um one colo Uh yeah. Uh I seen uh w uh something on the internet uh not today but uh a few uh weeks ago. Uh you got uh yeah quite an uh a kind of uh touchscreen um and it's uh for uh twenty uh Euros or uh less uh. So it's possible. Yeah. Yeah that's true. Uh. Okay. Mm. Mm. Yeah. Mm. forty Yeah. Yeah. Mm. Mm. Mm. Yeah. But um deaf people need uh teletext for uh for subtitles. So it's Yeah. It's Mm. Yeah yeah. Yeah. Yeah. Yeah. If it's only for televi Yeah. Yeah. Yeah. So we can s we can skip the display, so uh we don't need it. Uh Yeah. Yeah. Mm. Yeah. Mm-hmm. Yeah. Mm. Mm. Yeah. Hmm. No. No. No. Hmm. Mm. Hm. No. Mm. Okay. Yeah. Yeah. Mm. Mm. Yeah. Mm. Mm. No. So 'Kay. Yeah. Right. No. Yeah. Yeah. Yeah.

---

# Meeting ID: 118

Data Source: Train

## Executive Summary

now we are on the conceptual design meeting . I will again do the secretary part the decision we want to take on this meeting are on the um first on the component concept , so what kind of energy we use uh what kind of chip on print and one ki kind of case . And also on user interface concept uh what kind of interface we use and if there is some supplements . And at the end um Sammy will give um a trend watching on what he's he's been doing . we're to mainly design f mainly need to know which components we'll use for energy , and the material and interface . For energy there are maybe two or three possibilities . First one , we can use simple battery , or we can use traditional solar cells mm and the material we can have plastic , rubber which is good for this R\_S\_A\_ and then uh titanium , which can be which have very good look an and then interface we're to use push buttons or liquid crystal d L\_C\_D\_ display . we would like to have some speech recognition s chip in our remote control . this can be simple kind of programmable chip which can use microphone sensors . Still we are looking for possible uh technical uh specifications and how w easy we can do and within our pri range , like we're to in our twelve Euros or around that . So we are looking for simple devices or simple technology to do the location of remote control in a room or in a house . we would like to propose battery instead of solar cells and it would be problematic uh to have enough energy with the solar cells And also we want to go for titanium design instead of rubber or the problem is with this design we found that we can't use double-curved shapes . What is a double-curved shape ? Like you can have two curves . we want to go for simple push buttons because it need a simple chip and it's really lesser uh re really less expensive compared to L\_C\_D\_ uh which needs advanced chip technology and it's more expensive , since we want to put some other features such as speech recognition we want to reduce uh cost . Um I want to know why it b uh just uh sorry but for the point before uh why not the rubber , if it is something that it seems to be light . Uh Uh And also like in if you put a it's be difficult to do all the moulding of buttons and these things W we can use something like you know the whole body's titanium But full assembly We'll use mainly for titanium and also it's bit difficult to do all the shapes uh . we we would like to use push buttons instead of L\_C\_D\_s Y yeah we have simple buttons and speech recognition technology , mm can we still include the L\_L\_S\_D\_ display ? it's either L\_C\_D\_ or push-button . maybe maybe we can see depending on how we'll come up with our full design because the speech recognition technology will take at least five Euros or or something so we want to reduce the cost on display it's it's not gonna be a touch pad , uh just

a display for giving you information . the batteries uh are going to be very light . and now I think we have many options in the market so we can go for small nickel or alkaline batteries this device on n that can be used for speech recognition could also be used for just uh the finding it basically , instead of clapping why not just be ask . We have dreams and the in the end we find out that it's not feasible . the concept of the interface . Generally I developed quite a broad concept not only for the interface , but for possible instruction or user's manual and uh all the complex things that come together with your T\_V\_ and remote controls . We got our perfect remote control with a lot of buttons and uh we got explanation for every button and you can use your time and uh it will take i some days to learn all this buttons and um the L\_C\_D\_ is going to be somewhere here and uh go back button , I don't know really where it is , maybe one of this buttons , maybe this button is power on and off ? that's our concept . It's called the millennium remote control . doesn't make sense . This is very ugly . too much concept . we will not use this . We will not use this . But instead of this I will devise That's our concept . And it's got just few buttons , quite low looking , and all this stuff we already we already discussed . Do you think it can come in several colours ? I would make a backlight of the L\_C\_D\_ screen with different colours . Um but not the case . Uh the case would only be in that uh aluminium uh titanium stuff , Because apparently from your survey people like colours , let's remember there's a Nokia phone which changeable panels . so that would be the option But it would be expensive , no ? If you use colour L\_C\_D\_ . if users want more colours they can pay more money to get this uh the shapes and they can have different assembly . Uh instead of that maybe we can change the colour of the assembler . you you propose something with option i that increase the price if we if you want o more colours on L\_C\_D\_ , there's one more decisi uh one more solution in fact , um 'cause there are some some paints that can change colour according to where they are , like they can reflect different colours depending on what is around , like what colour is around , and depending on the temperature , but that's maybe mo too much expensive , yeah . Because uh I think there are two kinds of people . Those for which the remote control is uh is to be uh something useful and those for which is something that that that uh is uh specific to them I think I think they would be ready p ready to pay more for that . It might be optional , yeah . Could we integrate something into our remote control , something like light ? That they can use it in darkness , like . Hand light , And um the remote control's going to be smart but how smart should it be to not to complicate things too much ? I heard that uh it seems that speech recognition is something that can be done Are are you saying here that uh the remote controls should be aware of who is using it ? I just want to say it should be real smart . since we have we want to do some speaker dependent speech recognition uh so we can use So it could be smart in that way . it might also record the kind of uh channels you are u more often using and uh levels of volumes that you're more often uh things like that that might be expensive The remote that knows you . I'm going to talk about trends and um I hope this can help us to to understand I how we should design our remote control . Anyway these days uh the best uh source of information is the web as you know , but uh basically there are uh in in the market of of remote controls there are three aspects that we should very pay much attention to . The first one , which seems to be the most important one , is that it has to be fancy , it has to have a fancy look and feel . And uh interestingly this is the very most important thing . It has to be fancy . Strangely enough it's more important to be fancy than to be wi and now that's the second thing it has to be , it has to be technologically i innovative , it has to be new with some of uh new uh technology inside and uh and this is also

uh more important than the last thing which is that it should be easy to use and it should be easy to use as a remote control . And finally of course it has to be useful as a remote control but it seems that it's not so important that it's useful as a remote control . currently the trends that we see in I in I big cities like Paris and Milan , well , it seems that this year things should have uh a fruit and vegetable uh way of of look or feel And I think of course uh i it applies to everything . It it can travel f from clothe to furniture same idea . And uh if we co we compare to last year , now it has to be spongy , When we were talking about rubber , I think uh the rubber aspect might be important because it's what is probably more feasible in terms of sponginess . So maybe titanium it's not a good idea . Think more of uh something in the colours of uh like fruit and vegetables and spongy , even in the shape it has to be more round and uh more uh uh look natural somehow . I mean And not those futuristic uh remote control with angles and uh and titanium like . these abilities are mainly ad addressed by young people ? we have people uh uh listening to the trends everywhere in the world , of course , It's more general trend it's not particular to the remote control . But it seems that trends travel across things . but some materials n they're to be uh they're to be something like solid like they can't be really spongy We have to I think we have to have the look of fruit and vegetables fruit . These things can be easily incorporated . We can have t colours or this shape If if it's something like rubber made or I think it's also going to be good . we will have uh next meeting in thirty minutes again . Um now you have to go straight on this individual action which i which are for Rama uh wil design , um Mark the user interface design , and uh Sammy uh the product evaluation . Uh you will work together uh on a new on on a prototype using modelling clay . um and I as always your personal coach will send you specific instruction . we want the speech recogniser and we want some kind of buttons and we want some themes like fruits or vegetables , we want to follow general trend . No , we don't have to , Again , as I said we can also try to make it , to create the trend . are we confident enough on creating trends ? we can make it smell like fruit . what about location and these things , people are really interesting on those features ? Or they really like They more want these fancy features it has to be fancy Whether it's useful or not doesn't seem to be very important . so I think if nobody else pro provides currently a remote control with that kind of stuff and if we can provide it I think it's a good sell for us Now we have to decide on what kind of fanciness . Do we take titanium smelling like fruit , or do we make spongy uh fruity-like we will try to explore these two options Maybe you could explore the two option . Could we make a titanium shape ? I mean fruit-shaped . at least like we can make banana Doub double-curved . Don't you say that you cannot do double shape uh curved shape and and s we're to see the whether rubber is expensive In fact I just agreed to make uh to make the like titanium panels on a whole rubber body . you explore now that you're going to work together these these two . Maybe we can have two different assembly also like one spongy and one kind of titanium . I think we have to choose . If we choose uh titanium or if we choose spongy still we want to keep L\_C\_D\_ ? Or Mm I think it's what we say , that we have an uh an L\_C\_D\_ with uh information . The thing is that uh if we want to have as he says if we want to have uh a small number of buttons we need to have a kind of output that says currently what their actions are . That's the converse to having zillions of button where each button does only one thing . and we just stick with two batteries so it's not any solar or in general I think people uh change T\_V\_ more often than batteries of their remote control . Because the trend goes faster than the life of the Yeah , we're done .

## Complete Meeting Transcript

Ramaro. Yeah, participant two. Component. Yep. So we're to mainly design f mainly need to know which components we'll use for energy, and the material and interface. For energy there are maybe two or three possibilities. First one, we can use simple battery, or we can use traditional solar cells or mm and the material we can have plastic, rubber which is good for this R\_S\_A\_ and then uh titanium, which can be which have very good look an and then interface we're to use push buttons or liquid crystal d L\_C\_D\_ display. And we can use some, moving kind of thing. So, as we discussed before, we need to we would like to have some speech recognition s chip in our remote control. So this can be simple kind of programmable chip and which can use microphone sensors. And we also want to look at our remote control, so. Still we are looking for possible uh technical uh specifications and how w easy we can do and within our pri range, like we're to in our twelve Euros or around that. So we are looking for simple devices or simple technology to do the location of remote control in a room or in a house. So uh we discussed an Excuse me. So we would like to propose battery instead of solar cells and it would be problematic uh to have enough energy with the solar cells and so we would like to just use simple battery. And also we want to go for titanium design instead of rubber or and well the problem is with this design we found that we can't use double-curved shapes. Like you can have two curves. Uh it's I think in manufacturing I guess it's problematic. So, we want to go for simple push buttons because it need a simple chip and it's really lesser uh re really less expensive compared to L\_C\_D\_ which are uh which needs advanced chip technology and it's more expensive, since we want to put some other features such as speech recognition we want to reduce uh cost. Uh Uh And also like in if you put a it's be difficult to do all the moulding of buttons and these things and Yeah. Yeah. Like in cell phones recently these you can with the rubber in four directions and yeah. But full assembly We'll use mainly for titanium rubber is expensive and also it's bit difficult to do all the shapes uh. And this push buttons we we would like to use push buttons instead of L\_C\_D\_s and so we want to mo I mean we're we want to put speech recognition so we want to reduce price on this technology and so that we can have enough space or enough money for S S Y yeah we have simple buttons and speech recognition technology, so Uh I So uh it's like a Yeah maybe maybe we can see depending on how we'll come up with our full design then if we have enough money or like for and because the speech recognition technology will take at least five Euros or or something so we want to reduce the cost on display or this inter Ok Yeah, that can we we can consider, because like it won't take much money I guess, because Okay, yep. You have any further questions or? Yeah. Yeah, we're to go for li and now I think we have many options in the market so we can go for small nickel or alkaline batteries for really light batteries and with uh good price. Yeah, that's then the the one thing we want to know is like because remote control is used for like in the household so it it it will be it m maybe at least five, six people want to use it so so how to uh uh how to define our re speech recognition whether we want to do s speaker independent or speaker dependent. If we're going for more speaker independent then it would be like again cumbersome and we need really m more technology and so Yeah, if if everybody in the house n to locate then we're to go for some speaker independent technology or something. Yep. Thank you. Yeah. Oh. We have uh some limitations. Three. So maybe you can use in the end and Uh Mm. Yeah. But it's uh But it would be expensive, no? If you use colour L\_C\_D\_. Uh instead of that maybe we can change the colour of the assembler. Maybe we can just if users want more colours they ca

n pay more money to get this uh the shapes and they can have different assembly. So users have different I mean they have their own interests, colour interests and so So we can just if they want they can just pay another two Euro. Yeah. Yeah yeah yes. If they want like uh so that we can yeah. Yeah. Just they'll get few more things and few more colours. Lights, yeah. Yeah. Yeah yeah. Mm. Yeah. Uh Mm. But those people will be really few, no? So like we can those Ah. Yeah. Mm. Hmm. Yeah maybe like the infrared like we can put some radium chips or something so that like at least um yeah. Yeah, that Oh. Yeah. Uh that mm that could be feasible I guess, like So since we have we want to do some speaker dependent speech recognition uh so we can use yeah. Yeah, yeah. Yeah. Yeah. Yeah. Uh it's Hmm. Four. Mm. Yeah kind of um maybe Yeah it Yeah. Yeah. We need to think about mm mm. Fruit. Even shape? More yeah. Yeah. Mm. So these abilities are mainly addressed by young people? Or it's This you you so did you Where? Oh. Oh, okay, mm-hmm. It's not from mm. Mm-hmm. Yeah. Yeah. It's more general trend it's not particular to the remote control. Mm. Yeah. Yeah but some materials n they're to be uh they're to be something like solid like they can't be really spongy or yeah yeah. yeah, yeah sponge, yeah yeah at least that's Yeah yeah that yeah yeah. Yeah. Yeah, looking yeah fruit. These things can be easily incorporated. We can have t colours or this shape or at least yeah. Yeah. Mm. Yeah. Look and feel de Hmm. Hmm. Mm sounds interesting. So, can we highlight the specific features of our yeah, so so we want the speech recogniser and we want some kind of buttons and we want some themes like fruits or vegetables, that's we want to follow general trend. Yeah. So, do you think Hmm. Yeah. Yeah. That's So what about location and these things, people are really interesting on those features? Or they really like They more want these fancy features like Feature Yeah. Yeah. Yeah. Yeah. Yeah. Uh we will try to explore these two options and yeah yeah. Uh yeah at least like we can make banana or yeah it's it's yeah that's a we're to look for and and s we're to see the whether rubber is expensive and d Hmm. Mm. Yeah. Maybe we can have two different assembly also like one spongy and one kind of titanium. we have only the plastic or the the chippy yeah fibre chips or Uh. Yeah. Yeah. Yeah. Even design. So still we want to keep L\_C\_D\_? Or Okay. Yeah, then we can yeah, yeah, that user friendly or Mm. Yeah. Yeah. and we just stick with two batteries so it's not any solar or yeah yeah j yeah, because Yeah. Yeah. Yeah, we're done. Yep. How was lunch? Mm. Why? Mm-hmm. W we can use something like you know the whole body's titanium but there are some rubber or I dunno some rubber parts like to make it feel better and to you know Yeah. Yeah. Mm-hmm. Okay, and still we have mm can we still include the L\_ L\_S\_D\_ display? L\_C\_D\_ yeah L\_C\_D\_. No, it's not gonna be a t no touchable but still like a source of information or source for menus. Okay, so let's try it, let's t Yeah, yeah, it's it's not gonna be a touch pad, uh just a display for giving you information. Mm-hmm. Mm-hmm. Mm-hmm. No more questions. Mm yeah, yeah. But still uh L\_S\_D\_'s already quite nice, L\_C\_ I'm an artist, sorry. So uh, that's not I hope that's not too much. Okay. Uh participant number three. Uh mm mm uh have a look at this no it's yeah. Uh so the concept of the interface. Generally I developed quite a broad concept not only for the interface, but for possible instruction or user's manual and uh all the complex things that come together with your T\_V\_ and remote controls. So let's start with this. We got our perfect remote control with a lot of buttons and uh we got explanation for every button and you can use your time and uh it will take i some days to learn all this buttons and um the L\_C\_D\_ is going to be somewhere here and uh go back button, I don't know really where it is, maybe one of this butt

ons, and um power on and off mm I I don't remember so uh it it should be maybe this button is power on and off? Or no? I can see nothing. So that's our concept. It's called the millennium remote control. Yeah. Really? I thought you like it. Ah okay just press the button, please uh. Yeah, we will not use this.

We will not use this. But instead of this I will devise That's our concept. And it's got just few buttons, quite low looking, and all this stuff we already we already discussed. And uh what will people say? They'll say it's perfect. Or what will say? Uh they will say it's splendid. And uh e everyone will say I'll buy it. And everyone's gonna be satisfied. I would make a backlight of the L\_C\_D\_ screen with different colours. Not the case. Yeah. Okay, so let's remember there's a Nokia phone which changeable panels. Do you like it? That's why you don't have it. That's why, 'cause it's nasty. No. Um, I am here. Mm-hmm. 'Kay. Okay, what uh there's one more decisi uh one more solution in fact, um 'cause there are some some paints that can change colour according to where they are, like they can reflect different colours depending on what is around, like what colour is around, and depending on the temperature, yeah. We can make it in fact. If if if the okay. Mm-hmm, mm-hmm, so Uh-huh. So, be an option, yeah. Yeah, yeah, yeah. But you know if you want to be different you just take your remote control with you all the time. And it makes you different, you know? Anyone has their remote controls here? No? Mm-hmm. Okay. Uh-huh, uh-huh. Could we integrate something into our remote control, something like light? That they can use it in darkness, like. Hand light, yeah. Mm-hmm. Okay. Okay. Okay. S well, let's go on maybe with the presentation. And um the remote control's going to be smart but how smart should it be to not to complicate things too much? And uh I dunno that's a question to you and to mm to Mm-hmm. Okay, okay. So just just just just think about it um. Thank you. Uh yeah I just want to say it should be real smart. Voice recognition is quite tough. I say don't use it, and the control just looks. 'Cause I ordered jus To I to I lock it. Yeah, sure. Mm-hmm. Okay, thanks. What is spongy? Okay. Okay. So we have to uh for yeah so are we confident enough on creating trends? Well, we can make it smell like fruit. Yeah. Mm-hmm, mm-hmm. Could we make a titanium shape? I mean fruit-shaped. But Doub double-curved. Okay, okay. In fact I just agreed to make uh to make the like titanium panels on a whole rubber body. Well, okay w we'll see. Yeah We'll see. We'll see. We'll see. I I really don't like this modelling clay 'cause you know it makes some for for I dunno uh yeah um we'll look. Okay, okay. Alright, alright. Mm-hmm. Yeah. Mm-hmm. Thanks Don't be sarcastic. Mark. Uh Rama. Ah. Mm-hmm. What is a double-curved shape? Uh-huh. The cost. Mm like this? Mm-hmm. Speech L\_C\_D\_. Seems not, it's either L\_C\_D\_ or push-button. Ah. The L\_C\_D\_ would The display would only be display and not uh touch sensitive you mean. Just uh for output, yeah. Yeah. I guess no um. So the batteries uh are going to be very light. Okay. So this device on n that can be used for speech recognition could also be used for just uh the finding it basically, instead of clapping why not just be ask. Mm-hmm. Okay. No, it's okay. Puts less of constraint on what we can do but it's always like that. We have dreams and the in the end we find out that it's not feasible. Anyway. Yeah. L\_C\_D\_. L\_S\_D\_ is something else, and it's quite nice as well. So, go on uh artist. Hmm. Let's change millenniums. doesn't make sense. This is very ugly. Oh no, too much concept. Ah. Ah, back today. Do you think it can come in several colours? Or did the Um but not the case. Uh the case would only be in that uh aluminium uh titanium stuff, like Yeah, well they like uh something which is uh Mm yeah, okay, so that would be the option. I don't know I don't have a Nokia phone, but I don't use that but

again, uh I might Yeah, bu but Mm-hmm. Kind of upgradable uh remote control. Wow, wow. Mm. Like a chameleon. Mm-hmm. Because uh I think there are two kinds of people. Those for which the remote control is uh is to be uh something useful uh I'm going to talk about this later but and those for which is something that that that uh is uh specific to them so it it's like a signature. My remote control is pink. Nobody else than me has a pink remote control. And that makes me special. I think I think they would be ready p ready to pay more for that. Those who wanted to have it pink. No mm no. It might be optional, yeah. The the young people the young people want to be different from their friends. Although

similar but have something just slightly better. Pink Mm. Yeah. Yeah, yeah. You always have your remote. Oh, you don't? Yeah. You don't have your remote. When you know like for instance take the iPod. It's a kind of remote control. Uh it's white and it's so white that you see it from anywhere. It has this distinctive look and feel and look which people seem to like just because it's a colour that we don't usually see in a remote control. White. Seems important. Mm glow in the dark, so Okay. Yeah. Uh-huh, yeah sure. Well so I heard that uh it seems that speech recognition is something that can be done uh so that's the smartness of the thing. Currently we don't have guns with speech recognition or uh beer cans with speech recognition but we may have remote controls with speech recognition. I dunno. Don't touch the remote. But yeah. Are you saying here that uh the remote controls should be aware of who is using it? So for instance the young guy would not be able to use it because his father doesn't want. Like with some Maybe fingerprint recognition or Mm. Um Mm. Okay. So it could be smart in that way. But for instance th I I'm thinking about the other uh uh particularity that the the remote control could have. Since it it knows who is using it, it might also record the kind of uh channels you are u more often using and uh levels of volumes that you're more often uh things like that and provide you ways of using them, I dunno, somehow, I dunno, that might be expensive but that might also be a good sales pitch again. The remote that knows you. My turn? Okay, it's alright. Four, I think. Trend, yeah. No uh yes. Okay, so I'm going to talk about trends and um I hope this can help us to to understand how we should design our remote control. So, next slide please. So first maybe just a small recap on how how do we watch trends so it's not so uh simple you might think that it's easy but uh it's not so simple. Anyway these days uh the best uh source of information is the web as you know, so have to go often on the web and look at uh what the others are doing, and ask real people who are using real remote controls every day uh or any other tool that is similar to a remote control which basically is a small device that people have with them, always, like a phone. We can use the phone as a as a good uh uh example of where to be inspired. Of course those that who are watching the trends are also have to be inspired because in fact they're not only watching the trends, they're inventing it, they're creating the trend. I hope I'm going to try to help you on that. This is more risky because you're not following the trend, you try to invent it, which means either you succeed and you make a lot of money or you don't and you're out of business. So anyway uh next slide please. Uh to be to be quick there's a lot of words here but uh basically there are uh in the market of remote controls there are three aspects that we should very pay much attention to. The first one, which seems to be the most important one, is that it has to be fancy, it has to have a fancy look and feel. And uh interestingly this is the very most important thing. It has to be fancy. Strangely enough it's more important to be fancy than to be wi and

now that's the second thing it has to be, it has to be technologically innovative, it has to be new with some of uh new uh technology inside and uh and this is also uh more important than the last thing which we w may think that would have been the most important, which is that it should be easy to use and it should be easy to use as a remote control. So as you see uh it first have to be very nice, something that people are proud of uh uh that i uh they can be identified with uh and and then uh something that um contains very novel stuff that they can talk about with their friends, huh, mine has this and not yours. And finally of course it has to be useful as a remote control but it seems that it's not so important that it's useful as a remote control. Next slide please. Uh and now in a more uh general uh uh broad way of seeing th uh the thing. If we look back and not uh look at only remote controls I think it's important to see that the trends are quite the same in many areas so currently the trends that we see in I in I big cities like Paris and Milan, well, it seems that this year things should have uh a fruit and

vegetable uh way of of look or feel or so. And I think of course uh i it applies to everything. That's the thing with trends. It it can travel f from clothe to furniture same idea. Fruit and vegetable. Think fruit and vegetable. And uh if we co we compare to last year, now it has to be spongy, yeah. Well this so so I think uh uh i When we were talking about rubber, I think uh the rubber aspect might be important because it's what is probably more feasible in terms of sponginess. Seems not, seems not. Yeah. So Think more of uh something in the colours of uh like fruit and vegetables and spongy, as a even in the shape it has to be more round and uh more uh uh look natural somehow. I mean And not those futuristic uh remote control with angles and uh and titanium like. So that's what people seem to yeah i I know it's quite far from what you thought but that's that's fashion and Okay that's all I have to say. These I'm sorry. Yeah, yeah we have people uh uh listening to the trends everywhere in the world, of course, as you know our company is quite big and uh so I'm just asking them what are the current trends according to them when they go in the stores and when they ask uh their uh friends that are also well. No, it's not it's not this this is very general, yeah. But it seems that trends travel across things. The what we Sure. Yeah. We have to I think we have to have the look of fruit and vegetables but we still have to put our chips inside, so of course. This is your problem. This is not mine. Yeah, I think in the colours and in the uh the kind of material. If it's something like rubber made or I think it's also going to be good. Okay? Yep. Thanks. Mm-hmm. Okay. Thanks. Spongy. No, we don't have to, but seems it's the trend. Again, as I said we can also try to make it, to create the trend. So there's no Well, that's you t can try to convince us. Okay. that's a good idea, I Uh I think i yeah i it's again in this uh what I said first it has to be fancy so I think if nobody else pro provides currently a remote control with that kind of stuff and if we can provide it I think it's a good sell for us because we have it and others don't. It's fancy. Whether it's useful or not doesn't seem to be very important. Maybe you could explore the two option. Mm. Seems to be. If you have time. For creation. You can paint it afterward. No problem. We have a very large department of paint. You will do it. Yeah. The thing is that uh if we want to have as he says if we want to have uh a small number of buttons we need to have a kind of output that says currently what their actions are. Yeah. That's the converse to having zillions of button where each button does only one thing. Yeah. Classical, we stay classical in that we don't reinvent uh the wheel. Anyway it's very in general I think people uh change T\_V\_ more often

than batteries of their remote control. So. Because the trend goes faster than the life of the So it's very Okay. We're done. Okay, so now we are on the conceptual design meeting. Uh y getting close to the last is the penultim meeting. Mm great. So um I will again do the secretary part uh we will have three presentation first um uh the industrial design, first Rama then Mark and then Sammy. Um um we have to take a decision on the control remote control concepts and we have forty minutes. So what we want to the decision we want to take on this meeting are on the um first on the component concept, so what kind of energy we use uh what kind of chip on print and one ki kind of case. And also on user interface concept uh what kind of interface we use and if there is some supplements. And at the end um Sammy will give um a trend watching on what he's he's been doing. It's So, let's go. First with Rama. Participant two. Mm-hmm. Mm-hmm, okay. Um I want to know why it b uh just uh sorry but for the point before uh why not the rubber, if it is something that it seems to be light. Okay. You m titanium it's more uh Yes so mm Uh-huh. Okay. Okay. Okay. Okay. Uh yeah so Okay, s so simple button and uh speech recognition for the more complicated. Okay. Mm-hmm. Okay. Mm. Okay, for the location. Hmm. Okay. So let's now go to the you don't have more question? Um mm thank you mm. Yeah. Yeah, but mm. Okay. Um yeah. Now let's talk about uh interface. Three. Which one? Okay. Mm. No. Mm-hmm. 'Kay. Mm-hmm. Because apparently from your survey people like colours, no? Okay. So? Uh-huh, okay, so you you

propose something with option i that increase the price if we if you want o more colours on L\_C\_D\_, yeah. Okay. And thermodynamic also. Mm-hmm. Mm-hmm. Yeah but that's maybe mo too much expensive, yeah. But uh it can be in uh maybe in an a gradable version, but Mm-hmm. Okay and you think that we don't have to make to make them pay more because of uh o or this is Okay, so so i it's not uh a s base service it's a Mm. Okay. Mm-hmm. So m so maybe that's if that it's a selling point maybe it has to be the base. And you'll be different. Uh in the train uh, hello uh no. Want to change my neighbour. Mm. Mm-hmm. Iradium? Ah sorry. Mm. Okay. So mm Mm-hmm. Mm, that's a nice world. Okay. Mm. Okay. Mm. Mm-hmm. Okay. So it's yeah, Marketing Expert. Participant two? Four, sorry. Mm. Mm-hmm. S So maybe titanium it's not a good idea. Mm-hmm. Um sorry Mark. It seems to be Mm-mm. Mm-hmm. Hmm. You're old-fashioned. Sorry. Okay. Mm you have questions? Mm. Mm-hmm. Okay. No more question? Okay. So Mm-hmm. Okay, so we will have uh next meeting in thirty minutes again. Um now you have to go straight on this individual action which i which are for Rama uh wil design, um Mark the user interface design, and uh Sammy uh the product evaluation. Uh you will work together uh on a new on on a prototype using modelling clay. Mm-hmm um and I as always your personal coach will send you specific instruction. Yeah you're right, you have to So you say s S do we agree on that? Yeah. We have to. No. Okay, that's a good idea. So titanium smell like fruit. Mm-hmm. Mm-hmm. Okay. I I agree with uh this uh Now we have to decide on what kind of fanciness. Do we take titanium smelling like fruit, or do we make spongy uh fruity-like Mm. Yeah, yeah. Don't you say that you cannot do double shape uh curved shape yeah. Mm-hmm. Okay. Mm-mm. Okay, so you explore now that you're going to work together these these two. Or or spongy an yeah. Mm. Mm. Yeah I don't think w I think we have to choose. If we choose uh titanium or if we choose spongy but uh it cannot be both. Ah you can pretend that it's uh titanium. Yeah, do don't worry, you you you speak with mm mm. Okay. So explore a shape. Mm I think it's what we say, that we have an uh an L\_C\_D\_ with uh information. Not uh Mm-hmm. Mm. Mm. Okay. Yeah, yeah, yeah. Mm. Yeah. Mm-hmm. Okay. So are we mm. Okay. So see you in thirty minutes.

---

# Meeting ID: 135

Data Source: Train

## Executive Summary

welcome back fro to the second meeting . the first presentation we'll be looking at is Poppy's presentation . I will take this time just to apologise . Um , so I was looking at how we're going to go about the working design , Uh , on a functional side of things , we found out that wh from our previous meeting , we decided that there're certain points that will make our product unique . Um , one is the visibility in the dark , And we could use illuminated buttons , Or we could use fluorescent materials Um , also we could use um an alarm . So if we lost the um remote control , perhaps there could be a button on the television set itself , which you could press , Um , another thing I think we d missed out on on the last meeting was the fact that we should consider the environmental impact of our design . Um , from previous researches I've carried out on other projects , um we've learnt about smart materials where um um specific alloys of metals have a shape memory . So they can be heated and um and cooled , and they change the shape of um the metal . So um , the benefits of this for our product would be that when it came to the end of its product life , if it was heated , um everything would spring apart . So , all the um individual components could be easily separated , and then some could be reused , some could be recycled , I mean , the user would return the p product to the company , 'cause it's the product's responsibility to get rid of what they've made . Would we be the company that would break down these , or uh metals ? One thing we have to consider is our uh one hundred percent um turnover goal that we have for our financial sector . Um , so we'll have to investigate how much that will cost us , cost the company , Um also there is um components . But I haven't put this plan together yet . This would actually show the circuit diagram . Although I haven't come up with the final circuit yet . I it just shows what sort of energy source . It could be a battery , And , um , the next presenter will be Tara . There're two functional design options . A multifunctional remote control , which can be used for several entertainment devices . And a single function remote control , used specifically for the television . Um , multifunctional controls can be difficult to use , as the multitude of buttons can be confusing . A single function remote control is simpler to use , but it means you have to have other remote controls for your other entertainment devices . Um , I think that a single function remote control would be preferable , It'd be more compatible with a range of television sets , making it more internationally sellable . And it would be more profitable as it would be more simplistic . And less functions would have to be included . So it would be cheaper to make . So as far as we know , um , a single function television remote control is us usable

internationally ? Um , I was just wondering about the , what , what Genevieve said before , about having like some hidden controls like having the outer casing . And that would probably , um , I d , well well what you said before about it being a more profitable simplistic design . Does anyone object and , and find the multifunctional might be a better way to go ? because we're trying to do so much , that if we're trying to make a unique , user-friendly , dadada , and it's also multi also multifunctional , um , we're gonna go over budget for one thing . And with this we'll have more room in the budget probably to make a more original design . Okay . So I'll be discussing the functional requirements of this remote control . Um , I've done some marketing research , a lot of interviews with remote control users , um , and some internet research . and firstly I wanted to remind you about our company motto and purpose . So we believe in providing international market with fashionable products . Um , hence our motto , we put the fashion in electronics . Um , and we should also be looking to trends in clothing and interior design . Not just in electronic fashion . Any trends that are going on in , in the public , even media , Um , seventy five percent of users of remote controls find them ugly . Eighty percent of users would spend more money when a remote control would look fancy . Current remote controls do not match well the operating behaviour of the user . Um , seventy five percent of remote control users said that they zap a lot . Um , and fifty percent of users say they only use ten percent of the buttons . so it might be very appealing if , um , we have very concise buttons . And another thing with um lots of surfing , we'd probably have to work on something that could be um a lot more durable , And actually to go with that , I'm gonna give you some statistics on the uh relevancy of the buttons , how much they're used . Channel selection is used a hundred and sixty eight times on average per hour . Teletext , um , now I'm not too clear on what that is . it's just information that um , like television timetables , what's on , what's on now , what's on next , on every channel , and So it looks like something that we're gonna want to do some research on and include on our remote control . Um , and has a r a high relevance of six point five . Remote controls are often lost somewhere . Um , remote controls are bad for R\_S\_I\_ . But we'll have to also avoid , you know , buttons responding to the slightest touch as well . So I guess we're gonna have to figure out what age group we're , we're targeting , and if and if voice recognition is something we wanna look into . So it m it may be too complicated for us , but it's something to keep in mind anyway . And something that might further complicate it is that the T\_V\_ makes noise itself . We need to decide if that is our um intention is , is a simplistic design . Um an L\_C\_D\_ screen though might be something that , you know , you can shift through pages kind of li the way this PowerPoint is working . It would be good if it had the actual programme that was on , and what was next . Might be quite expensive to do that though . Um , I think our priority really should be unique design . so uh in my opinion it should be , um , user-friendly and unique . Um , I th myself , voice recognition kind of scares me off . I mean if we wanted to concentrate on fifteen to twenty five years olds , we could go for the fancy stuff . But if we wanna make fifty million , and and have everyone want this remote control , we should maybe stick to the basics . Um , so I I think , I think the older generations we should be catering to a bit more . Before we go into uh more discussion on we want this design to look like , I've received some information from the management that will affect some of our decisions . Um , for one thing , because Having controls with D\_V\_D\_ , V\_C\_R\_ , that sort of thing , would really complicate the design of the remote control . Um , we've decided not to include them and make it a specific , just a specific television um function . Which is good as , as we've sort of decided that we would like to go with that anyway .

Another thing that might um affect other decisions is that um the management feels that teletext is outdated , because more people are using the internet now . So , um , all the remote controls must have our um We'll incorporate our logo and colour in in some way . but for the purposes of this meeting I , I wasn't offered a , like a type of logo or colour , It's probably R\_ R\_R\_ in yellow . Um , so , now we need to discuss , um and come to a decision on our remote control functions , of , of how this is going to be . Are we going to write off the L\_C\_D\_ option ? So no L\_C\_D\_ , no teletext , and no voice recognition . I don't use teletext that much , but if it was on your T\_V\_ , you'd want to be able to use it , It was a management decision , so it's , it's pretty much out of our hands at this point . Um , well I guess , just from my findings it looks like we wanna minimise buttons . I think we should definitely go ahead with the alarm system idea that you had . Would you be able to , um , put the little device anywhere ? so it would need to be something that you could stick somewhere , or something . It would be able to use the same reception on the remote c control I guess , but the actual device would have to have its own infrared signaller . Would it need a battery then ? So , mm , more research into that one . um , the glow-in-the-dark , fluorescent , whatever , system , um is a go ahead . Um right , if w if we're minimising buttons , we might be able to make them actually larger . We could , may , possibly , sorry , incorporate them both so that the buttons could maybe be in the shape of the numbers themselves and be made out of some glow-in-the-dark material . I just thought that it , it might be sucking more battery power , if there , if it is a light up . Um , so like big b um buttons , for people you are visually impaired . I guess the other option , referring to the battery thing is , you know how cellphones will t light up for fifteen seconds or something , when you're s and then it goes , Um , if instead of a constant light up on the , on the remote control , if it lights up for ten seconds when it's touched again . That's probably feasible . Um , did we want to go for the glow-in-the-dark look ? Or did we want to go for the lighting up instantly ? Because it might , for , for our design purposes , I mean , the lighting up thing might be better because glow-in-the-dark material has a funny kinda colour . So we've decided on lighting up things . it might be perceived as tacky , glow-in-the-dark . Yeah well , I was just gonna throw out there the thought about um personalising the remote control . So I I dunno if there's something that diff , you know like five different face plates . and then that would be uh more profitable like as a sideline to the remote as well . I think that we should incorporate that . You could start out with three , and if , if we hit it big then we can add some on . Um , the environmental factor , we didn't bring that up again . We'll have to do more research .

## Complete Meeting Transcript

Oh, Function F\_ eight. That looks right. I'm sorry, what was that last one. Multifunctional and Ch Oh, I see. 'Kay. So as far as we know, um, a single function television remote control is us usable internationally? Right. D\_V\_D\_s and V\_C\_R\_? Okay. Yeah, I think I agree with the single design thing for now, because we're trying to do so much, that if we're trying to make a unique, user-friendly, dadada, and it's also multi also multifunctional, um, we're gonna go over budget for one thing. So Mm-hmm. Mm, 'kay. Yes I am. Oh, I'm not hooked up, but other than that, completely ready. Okay. Okay. Oh. I just lost my microphone. Just a moment. Okay. So I'll be discussing the functional

requirements of this remote control. Um, and I'll give you a little briefing on what that means exactly. Um, if you all remember from the email we got before our very first uh kick-off meeting, with the coffee machine? The functional requirements of that was to produce hot coffee quickly. Um, so what I'll be talking about now is the equivalent for a remote control. Um, so basically what needs and desires are to be fulfilled. Um, I've done some marketing research, a lot of interviews with remote control users, um, and some internet research. And I'll show you my findings. Oh, and firstly I wanted to remind you about our company motto and purpose. So we believe in providing international market with fashionable products. Um, hence our motto, we put the fashion in electronics. So I think that should be our priority here. Um, and we should also be looking to trends in clothing and interior design. Not just in electronic fashion. So that it's something that fits in the household. Um, we should be looking towards trends in both clothing and interior design. Any trends that are going on in, in the public, even media, you know who's famous, what T\_V\_ shows are being watched, um, to influence our remote control. Okay, so the findings. Um, seventy five percent of users of remote controls find them ugly. Which is a, quite a significant number. Um, the other twenty five percent didn't specify if they love them or found them, you know, neutral. Eighty percent of users would spend more money when a remote control would look fancy. Current remote controls do not match well the operating behaviour of the user. Yeah, they're willing, they're willing to spend money on a remote control with personality. As opposed to your basic, you know, oval black, all same size button remote control. Um, so it is something that people care about. It's not, it's not ignored in the household. Um, seventy five percent of remote control users said that they zap a lot. Zapping meaning they go through channels a lot. They're you know thumb-masters. Um, and fifty percent of users say they only use ten percent of the buttons. That's a very small amount. Thought that was interesting. Yes. And actually to go with that, I'm gonna give you some statistics on the uh relevancy of the buttons, how much they're used. And uh how important the uh users find them. So the power button, obviously, in an hour is only used once. Hopefully the person's not turning on and off the T\_V\_. Um, but the relevance of that button is nine out of ten. So people wanna be able to turn on the T\_V\_ with the remote control. Um, as opposed to standing up and turning on the television set. Channel selection is used a hundred and sixty eight times on average per hour. That's a huge amount. This is the most important button. Um, so obviously when commercials come on they're changing it, so as you said we want a durable button that's not gonna run down. Relevance of that button, our users found was uh ten, ten out of ten. Uh, ditto for volume selection, so ten out of ten. And it's used on average four times an hour. Not as much as channel selection, but still significant. Um, audio settings is used on average zero point eight times an hour. Relevance is two. Screen settings, which means brightness, colour etcetera, zero point five

times an hour. Um, and relevance of one point five. We're getting to specific statistics here. Teletext, um, now I'm not too clear on what that is. I don't know if you can help me. Flipping pages. Is that So like a running banner, underneath Oh. Okay. Okay. Like tells you the weather, and Okay. Right. Alright. Well I guess I'm not with it, because I wasn't But it's, it's being used fourteen times an hour. Um, and has a relevance of six point five. So it looks like something that we're gonna want to do some research on and include on our remote control. Um, channel settings. Zero point zero one times an hour. Relevance of three. Channel settings. P Sorry. Changing the channels? Oh, okay. Yeah. Okay. Um, so it's not used very often, but people still find it relevant. Okay. Um, biggest frustrations of uh the people that we interviewed. Remote controls are often lost somewhere. So that was already discussed by Poppy. How we could have a, an alarm system so that people can find it. Um, takes too much time to learn how to use a new remote control. So it should be very user-friendly, you know. People know

what to do very quickly. Um, remote controls are bad for R\_S\_I\_. Ah. Is that what it is? People with arthritis and such? Um, maybe our designers can look into that. Um, buttons that don't require, you know, very firm pushing, if they respond. But we'll have to also avoid, you know, buttons responding to the slightest touch as well. That's a problem. Okay. Did you guys uh get that one down? Um okay, here's some ideas for you. A large percentage of the public would pay for voice recognition on the remote controls. So I'll show you some numbers here. Um, so the youngest age group, fifteen to twenty five. Ninety one point two percent said that they would pay extra money to have voice recogni voice recognition included on their remote control. Um, and you can see that number decreases a bit with ol s Interestingly enough, twenty five to thirty five is the lowest amount. Um, that would, are willing to pay extra. So I guess we're gonna have to figure out what age group we're, we're targeting, and if and if voice recognition is something we wanna look into. And if we have the budget for it. Um, if we are targeting young adults, it looks like something that would pay off. Seeing as ninety percent, over ninety percent would pay for it. Mm-hmm. So that, that's a whole other field of research. I don't know if it'd be, if we'd still have a remote, or if you're talking to your television and saying change channel. Um and depending on how many members you have in households. So it m it may be too complicated for us, but it's something to keep in mind anyway. Right. Mm-hmm. Mm-hmm. It looks like Mm-hmm. It'd be like the ultimate remote. Um okay. And th the last thing here was a, an L\_C\_D\_ screen. So, I mean voice recognition might be a little too extreme for us. Not practical. Um an L\_C\_D\_ screen though might be something that, you know, you can shift through pages kind of li the way this PowerPoint is working. So that you don't have so many buttons to deal with. Oh sorry, just, just a screen, like a computer screen. S Or like um Yeah. Or Like an alarm clock. You'd have an L\_C\_D\_ versus just a, a normal clock. Oh just like an electronic screen. As opposed to just buttons. There would be like a little, like on Yeah. Like on the top of a cellphone, the the little L\_C\_D\_ screen. Um, now that's, I, I dunno exactly what exactly we'd put on there. I guess the channel that you're on, the v the volume setting. Mm-hmm. Well I guess that's something we can all take back to our respective research. Um, and finally, whoops, my personal preferences and thoughts. Um, I think our priority really should be unique design. Um, we want something that people want in their home. Every remote control looks the same, so uh in my opinion it should be, um, user-friendly and unique. So the other stuff might be a little too, a little too gadgety for some people. U

m, I th myself, voice recognition kind of scares me off. So if we're, if we're aiming to make this an international university, universally accepted product Um, and for all, the other thing is like age market. I mean if we wanted to concentrate on fifteen to twenty five years olds, we could go for the fancy stuff. But if we wanna make fifty million, and and have everyone want this remote control, we should maybe stick to the basics. Mm-hmm. Right. And we have to keep in mind the, the reliability of our research. I mean, you know, a sixteen year old boy would say, yeah I'd pay extra for voice recognition, until they realise that's three months allowance. Um, so I I think, I think the older generations we should be catering to a bit more. Yeah. Yep. Okay. That's it for the market research. Yeah. Maybe we can do the There you go. Oh, come back screen. Hmm. It's probably R\_ R\_R\_ in yellow. Yeah, I think. Okay, so I Are we going to write off the L\_C\_D\_ option? Yeah? Okay. So no L\_C\_D\_, no teletext, and no voice recognition. Yeah. Never heard of it. Um, well I guess, just from my findings it looks like we wanna minimise buttons. Um. And the What was the word they used? F findability is important. Mm-hmm. Mm-hmm. Mm. Mm. On the buttons? it doesn't It could it could be a tactile thing as well. Um right, if w if we're minimising buttons, we might be able to make them actually larger. And there's something on it. S you know like up arrow down arrow for, for volume. Um, and I don't know what we could do for, for

channels. S The numbers themselves. But then the like up button and down button for the channel, channel changing. Yeah. I just thought that it, it might be sucking more battery power, if there, if it is a light up. I'm not sure. Mm-hmm. Mm-hmm. Mm-hmm. I guess the other option, referring to the battery thing is, you know how cellphones will t light up for fifteen seconds or something, when you're s and then it goes, so if, if you're like changing the volume during a movie. I know, I'm thinking of mostly when you're watching a movie you turn all the lights off right. And you don't want to turn on the lights, to turn it down, because there's suddenly an explosion, and it's gonna wake up the baby. Um, so if you touch the button, it kind of reactivates it. It lights up for On self timer. Yeah. Oh, just if it was kinda the same way that a cell You know how a cellphone will light up for about ten, fifteen seconds when you touch a button, after having not touched it for a while. Um, if instead of a constant light up on the, on the remote control, if it lights up for ten seconds when it's touched again. Yeah, and you, you touch it and it just kind of lights up a bit, and it gives a faint glow. So if you have all the lights off in your living room, you'll, you'll temporarily see it. Because usually you're not fooling around for it for more than what ten seconds. So Mm-hmm. Mm-hmm. Oh right, the Mm-hmm. I was gonna say, Exactly. It the it might be perceived as tacky, glow-in-the-dark. It's kind of like Eighties neon-style. Um, whereas we're trying to be trendy and fashionable. So Mm-hmm. Mm. That's true. What um Oh sorry. Yeah well, I was just gonna throw out there the thought about um personalising the remote control. Um, it, you, 'cause you mentioned face plates. So I I dunno if there's something that diff, you know like five different face plates. I dunno if this will start making it more complicated, but it could increase the popularity of the, of the remote. Um Yeah, Exactly, like an iPod. Exactly. Or, or like mobile ph. And I dunno if we'd want to go with like T\_V\_ show themes or something. Like a Bart Simpson faceplate. But Mm-hmm. Exactly. You could start out with three, and if, if we hit it big then we can add some on. Mm-hmm. Right. Right. Okay. Yeah. That's okay. That's okay. Okay. Okay. Um, do I need to plugged in. F\_ okay. Function F\_ eight. Sorry about this guys. 'Kay. is on. Right. Okay. I will take this time just to apolog

ise. I, I only, uh, received my emails later on. 'Cause I was too busy carried away doing my own thing, which is not obviously not a very good part of a team-working thing. But there we go. Um, so I was looking at how we're going to go about the working design, and what we actually need to do, and what the remote control needs to do. And it needs to um allow a person to have a portable desi device, so they can control the television from wherever they are. They don't need to actually manually touch the television set. So, it gives them much more flexibility, and allows them to be where they want to be. Um, from Uh, on a functional side of things, we found out that wh from our previous meeting, we decided that there're certain points that will make our product unique. Um, one is the visibility in the dark, which was um Genevieve's idea. So we need to think about how we could bring this in um technically. And we could use illuminated buttons, which we are all familiar with when we're using a mobile phone, or um something fam familiar. A automatically, um lights up at first touch. Or we could use fluorescent materials which would just um take in the light during the day, and then as soon as they go off they would glow in the dark. Um, also we could use um an alarm. So if we lost the um remote control, perhaps there could be a button on the television set itself, which you could press, and then an alarm from the handset would sound where it was, hopefully in the room. Maybe behind a cushion or somewhere. Um, so that would work. Um, oop. Go back there. Um, another thing I think we d missed out on on the last meeting was the fact that we should consider the environmental impact of our design. Um, from previous researches I've carried out on other projects, um we've learnt about smart materials where um um specific alloys of metals have a shape memory. So they can be heated and um and cooled, and they change the shape of um the metal. So, for example, a screw that's holding something

together could expand and it would force all the components apart. So um, the benefits of this for our product would be that when it came to the end of its product life, if it was heated, um everything would spring apart. So, all the um individual components could be easily separated, and then some could be reused, some could be recycled, and I think that would be very important for products now. Especially 'cause there's much uh responsibility for all the um companies who are coming up with like new designs. 'Cause all, we all know that our resources are being limited, and we have to be very environmentally conscious. Yeah. Um And then Yeah. Yeah they would, um you would make the, the product as you normally would, apart from the, the bits that hold it all together would be made out of this shape-memory alloy. And that's the part that would um allow all the other parts to be separated at the end. I mean, the user would return the p product to the company, 'cause it's the product's responsibility to get rid of what they've made. Um, and then the company could then just use, make use of this shape-memory alloys to split up the components, and then either reuse some bits, and other bits which are obviously gonna wear out with time, or not usable, they might be like be able to put into scrap metal. Something like the case, if it's scratched or something, you would want to reuse it, but you might be able to melt it down and reuse it again somewhere else. You could we could probably empl em employ a, a side company or something to do that for us. But it would be our responsibility to get that done and to dispose of the products that we made. For a certain percentage at least. Not every, not a hundred percent of everything we produce, but Yeah. Yeah. Yeah. Well I the fact of the shape-memory alloys is that they, they don't need to be manually de um deconstructed. Like, you don't have to individually um unscrew all the screws. Because of this, their properties

are smart material. All you need is just the heat, so they self-destruct themselves. So I suppose it does need like high contact, yeah, you know high uh quality machinery, and very specific machinery, but Yeah. Okay. Um also there is um components. This'll be how it uh will actually work. But I haven't put this plan together yet. There we go. Sorry, should I go back. This would actually show the circuit diagram. Although I haven't come up with the final circuit yet. So I just put all those components in. Yeah. I it just shows what sort of energy source. It could be a battery, like rechargeable probably. Um, an' yeah, well how the infrared will actually be sent through the chip to be received by the chip on the television set itself. Okay? So, now is it F\_ eight again to escape? Or escape? There we go. Okay. Thank you. There you go Tara. Function F\_ eight. The one at the top. Um, I was just wondering about the, what, what Genevieve said before, about having like some hidden controls like having the outer casing. And that would probably, um, I d, well well what you said before about it being a more profitable simplistic design. I suppose having that would complicate it a lot more. And limit the design. Do you think? Yeah. Yeah. That's true. Yeah. Yeah. Okay. Yeah. Mm. Yeah. Mm. Yeah. Mm-hmm. Mm. the single function. Yeah. Yeah that's a good point. It's like the news. Or like information. The and what's on. It's like It's like very basic internet. Sort of, um Yeah, it's just information that um, like television timetables, what's on, what's on now, what's on next, on every channel, and Yeah. To get the right reception and picture, I suppose. Repetitive strain injury. I think. Oh, I'm guessing that's what it is. I'm not Mm. Yeah. Yeah. It is. Mm-hmm. Mm. Yeah. And if there was conversation in the room at the same time, although in theory it doesn't tend to be when you're watching television, but could be very difficult to get the specific uh design. Yeah. Mm. Yeah. Mm. What, what would appear on the screen? Like linked in with the teletext, or sort of like an teletext at your fingers, without having to access that through the television. Mm, Yeah. Could be. Mm-hmm. Yeah. Mm. Yeah. Yeah. Complicated jus complicating things even fo Mm. Okay. Can I just interrupt? Would you like to plug in your Have you got a PowerPoint or not? Okay. Thanks. Were they, was the management suggesting use of the internet

rather than teletext, or just avoiding both altogether? Yeah. Yeah. Okay. Yeah. Okay. Right. Yeah. Yeah. Okay. Just Okay. Work on that. Yeah. Mm-hmm. Okay. Yeah. Yeah. Yeah. I don't know. More research required, I think. But if Was it a management decision that we're having Okay. So Okay. 'Kay. Minimal Yeah okay. Yeah. The same signalling. I mean Or vibrate just the same as a mobile phone. Like you just a, a buzz or something. Yeah. If Do you mean the the link between the Well, if the button was actually on Oh, yeah. Maybe Yeah, yeah. Maybe something adhesive that you could like stick onto the back of any set that would be um yeah not very obtrusive. Obviously something small that's Yeah, that's a good point. Yeah. Yeah, okay. Pr probably. Unless it could be Okay. Um, unless some way, it could have some universal connection to like the socket, the same socket that the T\_V\_'s supplied from. I mean the power for the T\_V\_. So, mm, more research into that one. Yeah. Y Yeah. Yeah. Yeah. Yeah. Like a raised Yeah That's true. And also y, uh Heather you mentioned before, um like how it should be accessible to everybody. Um, so like big b um buttons, for people you are visually impaired. The glow-in-the-dark or light up won't make any difference anyway. So like you say tactile might be better, because it'd be more available to everybody. Yeah. Yeah. Mm-hmm. Yeah. No, it's not these days. I mean, it's quite easily accessible. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah. So self-timed lighting. Um, I Yeah. So, self-timed Yeah. Yeah. I think the shape of th

e numbers is a really good idea. And I think that's un unique as well. I mean, I haven't seen that. And as you're saying like numbers can wear off if they're just sort of like painted on, you know printed. durable. Oh yeah. Yeah. Yeah. Repetitive strain injury. Mm-hmm. Yeah. Yeah, and we could Yeah there are now like loads, or a huge range of different colours that it could light up in as well, which could like link in with the company colours. Like it could be blue or green or yellow, or like we've just limited t with the, just ordinary phosphorescent so Yeah. Every time the, that it lit up, you c that could light up as well. Or, or the, whate Yeah. Is Okay. Like you can have changeable um mobile covers or something. Yeah, or Okay. Yeah. Person Yeah. Well, that's great. Interchangeable. Um, als Yeah. Interchan And also possible I mean, uh, we could gain out of that by advertising certain T\_V\_ shows, or Yeah. But if we, there is Yeah. We could Um, the environmental factor, we didn't bring that up again. Yeah. Um, I've Okay. Let's I think we could probably leave that 'til later on, then. No. Okay. Thank you. Am I starting now? Anytime? Oh sorry. 'Kay, um. Alright, welcome back fro to the second meeting. And um I hope you had a productive last thirty minutes. Um, and um, I'll be taking minutes on this one, and um Being hooked up to the PowerPoint for this meeting isn't very necessary for uh myself, because it'll be more about uh, what you guys are bringing to the meeting today. Um, so, the first presentation we'll be looking at is Poppy's presentation. And, um So, sorry? So, um, take it away Poppy. It's, it's plugged in. So, um No problem. I'm sure it's fine. Right, um, one question. This, um, self-destructible uh metal, it allows for recycling materials? So that, um, someone could have this product for as long as they felt that they wanted it, and then once they contribute it, then that company can break down the part, the parts better? Yeah. Mm-hmm. Would we be the company that would break down these, or uh metals? Or would we contribute to another group? Alright. Okay. This sounds like a really great idea. One thing we have to consider is our uh one hundred percent um turnover goal that we have for our financial sector. Um, so we'll have to investigate how much that will cost us, cost the company, um 'cause it sounds very labour-intensive. You would have to hire a number of people, and it might be more expensive. Mm-hmm. Alright. We'll still have to investigate the financial implications. Alright. I like the environmental approach. Um, we'll have to see if that can meet our financial goals as well. I'm sorry, could you Those were um Okay. So those are what, um, we'll c construct the remote. Those are all the Alright. Great. Alright. Thank you very much. And, um, the next presenter will be Tara. Yeah. Function

F\_ eight. Sorry. Yeah. Right. Does everyone agree with this? Does anyone object and, and find the multifunctional might be a better way to go? Mm-hmm. Yeah. Alright. Sounds great. Alright, well, um, are you ready for your presentation Genevieve? Fabulous. Except you're not hooked up to the Great. No problem, we can I'm sorry, what was that last thing that you just said? Mm-hmm. I'm sorry, that eighty percent of users would spend more money when a remote control would look fancy. You mean that they would spend more money on a fancy-looking remote control? Okay. Alright, so it might be very appealing if, um, we have very concise buttons. And another thing with um lots of surfing, we'd probably have to work on something that could be um a lot more durable, because I find with um channel-changers that, um, a lot of the numbers get rubbed down if they're printed on the button. Yeah. It's um No it's a button that you press, and then you, uh, like a menu pops up. I haven't used it before but Mm. That's rather sad. Yep. I agree with um if we're targeting young adults then it would be something we should look into. Um, financiall

y and and functionally. Um, and especially if we are um trying to be trendy, go with fashions, things like that. Um, ages like from thirty five to sixty five which show lower numbers probably won't be as concerned. Mm-hmm. Yeah. And something that might further complicate it is that the T\_V\_ makes noise itself. Wonder if it would have Yeah. Yeah. If we're looking for a simplistic design, if We need to decide if that is our um intention is, is a simplistic design. Um, because if, if it is then I think voice, um voice-activated Yeah, and that would sort of negate the whole remote control thing, because if people can activate the television with their voice then they won't be using a, they won't be talking into a remote, I'm sure. Um, I don't know what an L\_C\_D\_ screen is. I have no idea still. I'm sorry. Oh, on the remote. Okay. Yeah. Right. Mm-hmm. Yeah. And if one of the largest, uh, or most complained about thing is that it takes so long to get to know how to use a remote control, I'm sure that something like an L\_C\_D\_ screen or remote control would be just furthering that problem. Yeah. Alright. Okay. Before we go into uh more discussion on we want this design to look like, I've received some information from the management that will affect some of our decisions. Um, for one thing, because Having controls with D\_V\_D\_, V\_C\_R\_, that sort of thing, would really complicate the design of the remote control. Um, we've decided not to include them and make it a specific, just a specific television um function. Which is good as, as we've sort of decided that we would like to go with that anyway. Um, for many reasons. So um we have that decision sort of made for us. Another thing that might um affect other decisions is that um the management feels that teletext is outdated, because more people are using the internet now. And so uh we won't concern ourselves with um navigating the teletext option. Yep. Okay, sure. Yeah I do. I'm looking at looking at it right now. thank you. Um, well, I mean we don't have the resources or or possibility of using the internet with the remote control, but um they were just pretty much saying that the teletext would not be used. Alright, and another thing. This is for the design, the design of the product is that um we wanna create, um more of a sense that people know that this is from our company. So, um, all the remote controls must have our um We'll incorporate our logo and colour in in some way. So, um, perhaps um our logo on the bottom, or wherever you feel like it would look good. Um, it doesn't have to be the colour of our um of our company but, another thing is that, um we need to, we probably would have to have that colour and, and logo decided upon. Um, I'm assuming that we already have one, but for the purposes of this meeting I, I wasn't offered a, like a type of logo or colour, so if that could be um somewhere on the design so that we can be recognisable. The little R\_ R\_ yellow thing? Okay. Real Reaction? Okay. Um, yes, those are the changes. Um, so, now we need to discuss, um and come to a decision on our remote control functions, of, of how this is going to be. I'm just going to look at my notes for a second. Um, we have to decide on a target group and the functions of the

remote control. So, um, we already know that it'll just be for the television. It'll It won't have teletext. But um, you know, we could discuss um those other options that you brought up, Genevieve. Is that how most people feel about that? Okay. Yeah, but another thing is that if we're reaching an international crowd, um, I know for one that in North America there is no such thing as teletext, so it'd be really superfluous. Yeah. I don't know about other countries besides the U\_K\_. Do you know if anywhere else has it? Alright. It was a management decision, so it's, it's pretty much out of our hands at this point. 'Kay. So, I guess we're looking at something rather simple. Yeah. I think we should definitely go ahead with

the alarm system idea that you had. 'Cause I'm sure that could be in inexpensive because we could use the same kind of infrared the same signal through that and it could just like make a little beeping noise. It's not that expensive to do. Yeah. Yeah. Okay. I like that idea. Yeah. The button Oh. Minor detail there. Yeah, it would have to Mm-hmm. Yeah. Then it wouldn't, it probably wouldn't be able to use It would be able to use the same reception on the remote control I guess, but the actual device would have to have its own infrared signaller. Okay. Maybe, um Probably, I mean. That's your department you'll have to sort that out. Yeah, you'll have to Yeah, you'll have to invest Do some research on that, alright? Great. Um, alright, and I'm sure that, um um, the glow-in-the-dark, fluorescent, whatever, system, um is a go ahead. Is everyone interested in that? Yeah. Yeah. Hmm. Yeah. But I mean Yeah. Yeah. Could we somehow We could, may, possibly, sorry, incorporate them both so that the buttons could maybe be in the shape of the numbers themselves and be made out of some glow-in-the-dark material. 'Cause I don't think that glow-in-the-dark material, um, like the actual soft plastic, um, costs that much more than other colours. Yeah. Alright we have five minutes left um, for the meeting, but I think we should discuss this light subject a little bit more before we close. Um, what was I missed the last moment, reading that. What were you talking about with the lighting up buttons? Yeah. Yeah. Mm. So it could be any button that would be pressed. Yeah. Okay, so That's probably feasible. So, do you think that we should do the lighting up thing, and the glow-in-the-dark thing, and the shape of the numbers? Do we have to kind of decide what we're gonna do with this. Yeah, okay. Yeah. Yeah, yeah. And it could, if it's that softer rubber material it'll be, maybe, um, uh, better for people with um els no what's it called, R\_S\_I\_, what was it that we were talking about? Yeah. Yeah instead of like hard buttons. Okay. Um, did we want to go for the glow-in-the-dark look? Or did we want to go for the lighting up instantly? Like should we do both? Or we can have one or the other? Because it might, for, for our design purposes, I mean, the lighting up thing might be better because glow-in-the-dark material has a funny kinda colour. And it might not go with different like face plates that we might come up with. Yeah. Right. Right. Alright. So we've decided on lighting up things. Yeah. Yeah. But with the same thing, I mean. If you touch the button and then it could be, it could be lit up as well. Is Are you okay with that? Okay. Cool. Um Alright. So I think that um that completes most of our um our more uh practical decisions. And now it's up to designing. And um making sure that this can be feasible. And do you have anything Do you have anything to say? Like an iPod or something? Okay. Like a cellphone? Yeah. Mm-hmm. Accessories. Yeah. I think that we should incorporate that. 'Cause that wouldn't be very expensive at all. You'd just get one mould, throw some plastic in it, you know. Yeah. Well, that might be com problematic with um copyright issues. So, if it takes off then we'll, we'll, we'll try that out. Right. We'll have to do more research. Like as of yet, that has nothing to do with, um, the way it'll look. Um, does it need to be reached a de Do we need to reach a decision on that right now? Because we need to investigate the financial implications. Okay. Is it Does it need to be uh decided on now? Or should we Okay. Good. Alright then. Anyone else have anything more to say before we close? Alright, well. Let's

have lunch and we'll discuss this later. Alright? F\_ eight, w. Function F\_ eight. Thanks. Can you see? Do you think Is it uh, function eight yeah? Oh right. Okay. Okay. I'm the User um User Interface Designer. Uh, the technical functions design of the apparatus is the effect the apparatus should have. Um, in this case it's the

function of the remote control, which is to send messages to the television, television set. By taking inspiration from other similar designs, we'll try and come up with an original trendy remote control, which is sellable international. There're two functional design options. A multifunctional remote control, which can be used for several entertainment devices. And a single function remote control, used specifically for the television. Sorry. Um, a single function just for the television itself. Yeah. Um, multifunctional controls can be difficult to use, as the multitude of buttons can be confusing. A single function remote control is simpler to use, but it means you have to have other remote controls for your other entertainment devices. Um, I think that a single function remote control would be preferable, because it's easier to use. It'd be more compatible with a range of television sets, making it more internationally sellable. Um, it will make an original design more obtainable, as we have less functional necessities to include in the design. And it would be more profitable as it would be more simplistic. And less functions would have to be included. So it would be cheaper to make. And probably more sellable just because it's more compatible with a r a wider range of devices. Does anyone have any questions? Well, it's just that, when we're creating it, we're, we have to make it um compatible with different brands of devices. And it would be easier to make it compatible with just different brands of television devices rather than other ent, yeah, other entertainment devices. Yeah. Yeah. Yeah. Yeah. And with this we'll have more room in the budget probably to make a more original design. We'll have more money to go into the design side of it. Yeah. Yeah. It's um It has T\_V\_ has like information, it has information on holidays, the news, entertainment. No, li Yeah. Yeah. And you have page numbers like for the menu, and you press the page numbers with your remote, and it, it'll come up. Very basic internet, yeah. But you have Yeah. But you have no interaction back with it, you know. Like the internet you can send emails and You've no interaction. Yeah. Yeah. Uh, probably just tuning in the channels, would it be? Tuning them in at the very start. You know if you get a new T\_V\_ set, you tune in all the channels, do you th do you think? Yeah. Yeah. Repeti Uh. Yeah, yeah. I think it is. Yeah. Mobile phone. Yeah. Yeah. Could it it It would be good if it had the actual programme that was on, and what was next. But that would probably be Yeah. That would be good, yeah. Yeah. Might be quite expensive to do that though. And we should keep in mind that fifteen to twenty five year olds might not have twenty five Euros to spend on a remote control. Like their priorities might not be a fancy remote control, when they're just starting out and, yeah. Yeah. Yeah. Early twenties, that's the kind of age group. Twenties. Yeah. Yeah. Yeah. Yeah. I think it would be annoying though if I don't use teletext that much, but if it was on your T\_V\_, you'd want to be able to use it, if You'd Yeah. So is it just Okay. Alright. Right. I don't know. I don't know. Yeah. Okay then. Yeah. Would you be able to, um, put the little device anywhere? 'Cause uh isn't our remote control for all T\_V\_s, so you'd ha Yeah, with the button that you pressed. Yeah. C 'cause then it would only be a applicable to one T\_V\_ set, so it would need to be something that you could stick somewhere, or something. Yeah. Yeah. Yeah. Would it need a battery then? Yeah. I I like the light up suggestion. I think that would be better. 'Cause you know the way fluorescent lights lose their brightness after certain time, so I would go for Well just the numbers could be embossed, couldn't it? Like raised. Yeah. Could be raised. Just little arrows, that you could feel, maybe? Yeah. Yeah. That, I think that's good, yeah. Yeah. Yeah. Yeah. No, I wouldn't say so. That's good Yeah that a good ide

a. Yeah. Yeah. That, yeah, that's a good idea. Yeah. Yeah. For visually impaired, yeah. Yeah. If I was thinking though, if it was glow-in-the-dark, you could put the um Real Reaction symbol as glow-in-the-dark, and then it would be constantly advertised. Yeah. Yeah. Yeah. Okay. Yeah. Oh yeah. Interchangeable thing? That would be good. Yeah. Yeah, and then that would be uh more profitable like as a sideline to the remote as well. Y Could buy extra Yeah. That's a good idea. Yeah. No. Oh yeah. If w No. Okay.

---

# Meeting ID: 72

Data Source: Train

## Executive Summary

Right Where we uh We have twenty five minutes for this meeting . We uh are to get acquainted . So does everyone want to say who they are ? I'm Robin . I'm I'm And I'm Alastair and I'm the project leader . So does anyone have any uh thoughts as to the tool training that uh is required ? so tool training . Project plan . I'm not exactly sure what you mean by tool training . Neither am I . So we have the project team , which is to um basically to come up with a new r remote control device . And uh our idea is to uh to make the new remote control device uh more user friendly than the previous one , and to to be trendier , to be with it , and therefore to uh to get a bigger market share and bigger audience . method of doing this is uh split up as you can see into uh the functional design , the conceptional design , and the detailed design in each of these uh phases we'll uh basically be handing over to yourselves , the designers of this uh this device . And uh having uh meetings so that we can uh during the course of the day um come up with a better better inst implement than we had before . So we've got tool training . Right so everyone's to uh supposedly uh draw their favourite animal over on the white board over there . I guess this is uh make sure the whiteboard works . Do you wish to go f Have a first bash at uh whatever . I think that I would have to say that my favourite animal is the cat . Um and I like my animal that looks nothing like a bear because um I dunno maybe because there's so many cartoon characters made up after the bear Um I'm gonna go for the dog , So what my daughters have got at the moment is they've got uh a few fish and so hopefully um won't prove too difficult to draw . Work has been done on uh this uh project where by um twenty five Euros is uh the uh expected uh selling price . So we're looking to sell internationally , not just in Europe . We're looking at um having our production costs limited to uh twelve and an half Euro per unit . And therefore making a profit margin of uh well not actually a profit margin it's uh because obviously you're gonna have overheads and various other costs to uh take uh from uh from that to give you your profit margin per unit . And so depending what the uh the overhead uh costs are will determine uh how many units we're uh looking to sell or projecting to sell at this point in time . Experience with remote control , first ideas . New remote . So I guess we're looking at um having a discussion at this point in time So uh any any thoughts ? Um I with some remote controls the buttons were a little small so maybe we make something with uh easy to press buttons . Okay , so so basically we're looking for some um we're looking for a device that is um robust and and therefore uh won't get damaged too easily . Um sort of easy to use so the buttons are accessible . Is this just a

television remote ? Because a lot of um systems are kind of T\_V\_ video combined now , or T\_V\_ D\_V\_D\_ combined . And one of the most annoying things is having like five remotes in the house . So if you've got a combined system , it could be a combined remote . basically I'll get back to you on that . Um one of the things um we found from the market research is that people often get confused by the number of buttons on them as well . Or is it just a television that we're supposed to be doing ? 'cause as you rightly said , there's nothing more annoying than having three or four devices littered about the uh about the room . So a device for for all remotes . And um sometimes uh they sort of remote controls defeat their own purpose because you're sat in the chair and the remote is somewhere else in the room . we need to sort of maybe think about how um we could maybe uh develop a remote control which moves around the room . Comes to your whistle . That's that's maybe something for the future when you can talk to your television , but Maybe we could um have better instructions with the remote . I mean we've done some research um about sort of you know what the cutting edge sort of hand held devices are , Next meeting in thirty minutes . You can't have both the th the one device and then have few buttons on it to 'cause you want you want simplicity as well , Whilst at the same time you want , as you rightly said , one remote for all . And so these are probably mutually exclusive options you could argue that experience of using devices and similar devices as people get more and more used to using remotes , So it's possible that we could devise a system where where you're you're basically sort of holding a a miniature computer which is controlling all your your sort of your television , your stereo , Okay , so we've got um the working design for I\_D\_ . For U\_I\_D\_ the technical functions design . Marketing , the user requirement specification . Specific instructions will be sent to you by your person by your personal coach . And I guess I'll try and write up some minutes of uh this meeting to uh to give it to you for the next meeting . I'm not exactly clear on what we're designing the rem remote for . Is this a mun multi-functional one I think you just said at the start it was a television remote control , so maybe we should just stick to that unless we get told otherwise . That's true , 'cause during during the course of our day we might make decisions based on information or meetings that would change where we're going . But at this point in time I think you're right that uh shall we make it just a T\_V\_ .

## Complete Meeting Transcript

Mm-hmm. Yeah. I'm Robin. I'm the Marketing Manager. Mm-hmm, okay. I dunno. Your microphone's just Yeah. I don't know. We can have have a whole menagerie. Right. Hello. Um I'm gonna go for the dog, and I'm gonna draw one badly as well. Uh. looks like it's going to be a dachshund or something. Right. There's my dog. Um I like dogs because they're very loyal. And they're always happy, so whenever whenever you're feeling sort of a bit a bit down or tired, they're always coming up and they're always um quite excited. So um you can always have a lot of fun with a dog. And they're also good for exercise as well. You can sorta get out and they they sorta never get tired. And and when they're tired they're quite cute as well, so. Okay, that's why I like dogs. Great. Mm-hmm. Yeah. Mm. Yeah. I've Okay. Yeah. Um one of the things um we found from the market research is that people often get confused by the number of buttons on them as well. 'Cause there's quite often lots and lots. And um

sometimes uh they sort of remote controls defeat their own purpose because you're sat in the chair and the remote is somewhere else in the room. So whereas in the past you'd have to get up to change the channel, now you have to get up to sort of pick up the remote. So so I don't we need to sort of maybe think about how um we could maybe uh develop a remote control which moves around the room. I don't know. That's that's maybe something for the future when you can talk to your television, but Yeah. Yeah. Mm-hmm. Mm-hmm. Yeah. I mean we've done some research um about sort of you know what the cutting edge sort of hand held devices are, and a lot of them sort of use you know they're like they're like mini laptops. So it's possible that we could devise a system where where you're you're basically sort of holding a a miniature computer which is controlling all your your sort of your television, your stereo, and where you know if you buy a new thing then it sort of you can link it to that as well, maybe. Okay. If you just click return it should be okay. It'll get rid of the message. If you hit just hit return and it should get rid of the message. Oh you've got. Yeah. Yeah. Mm-hmm. Mm-hmm. Okay cool. Okay cheers. Okay. I'm Nick. I am the Industrial Designer. Tool training. Yeah. Yes. Okay. You've lost uh your microphone there. Okay, yeah. I'll I'll Shall I see if I can get across without just tangling everything. Okay. There's one. Didn't think of that. 'Kay uh pens are over here. I'll try the red pen. Okay. Um. I'm gonna go for the bear which I'm be able to draw very well, but I'll have a bash at it. Uh. Ooh ooh I lost it there. I think I've just knocked the microphone. Um. We'll g then we'll go for a a s small small bear. Um and I like my animal that looks nothing like a bear because um I dunno maybe because there's so many cartoon characters made up after the bear like the jungle book characters and stuff like that. Great. Yes. Um I with some remote controls the buttons were a little small so they're quite hard to press so maybe we make something with uh easy to press buttons. As that is the main function. Yes. Um sort of easy to use so the buttons are accessible. is easy to use and see. Yes. Sorry, you go. You go. Yeah. Yes. Yeah. Maybe we could um have better instructions with the remote. Or are we just doing the design of the remote control itself, or sort of the instructions that would come with it? 'Kay. Or not. slide four Okay. Yes. 'Kay, yes. I think you just said at the start it was a television remote control, so maybe we should just stick to that unless we get told otherwise. 'Kay. Okay, that's great. I'm Louisa. I'm the User Interface Designer. I'm not exactly sure what you mean by tool training. I don't mind. Um. Let's see. Good job I got pockets today. Are we supposed to do this right now, do you think, or? Oh. Right here we go. Okay. I think that I would have to say that my favourite animal is the cat. Little smiley cat there. Um and this would

be because they're very independent, uh they're very intelligent, compared to dogs maybe. Um and they can be very very affectionate. Some people don't think so but I know very affectionate cats. Um. Um and they can look after themselves. Shall I rub that out, actually? That's quite good. Can I just check? Is this just a television remote? Because a lot of um systems are kind of T\_V\_ video combined now, or T\_V\_ D\_V\_D\_ combined. And one of the most annoying things is having like five remotes in the house. So if you've got a combined system, it could be a combined remote. Or is it just a television that we're supposed to be doing? Comes to your whistle. I think that might be back to the start. Um if you grab the kind of uh slide to the left and pull it down? I'm not exactly clear on what we're designing the rem remote for. Is this a mun multi-functional one or do we decide that ourselves as we go away and work on it? Right. Okay. Right, so start of the first meeting. Uh. Right, so agenda of the first meeting. Where we uh We have twenty five minutes for this meeting. We uh are to get acquainted. So does everyone want to say who they are? that seem sensible? And I'm Alastair and I'm the project leader. Alright okay, so tool training. Um. Project plan. So does anyone have any uh thoughts as to the tool training that uh is required? Neither am I. Oh I see, so we shouldn't really be Oh right okay, so. So

we have the project team, which is to um basically to come up with a new r remote control device. Uh we have uh the starting base was the original which has been in existence now for a period of time. And uh our idea is to uh to make the new remote control device uh more user friendly than the previous one, and to to be trendier, to be with it, and therefore to uh to get a bigger market share and bigger audience. So um method of doing this is uh split up as you can see into uh the functional design, the conceptional design, and the detailed design. So um in each of these uh phases we'll uh basically be handing over to yourselves, the designers of this uh this device. And uh having uh meetings so that we can uh during the course of the day um come up with a better better inst implement than we had before. And therefore um have a successful uh conclusion to the day. Um and you'll be doing uh various designs uh throughout the day to meet this end. So we've got tool training. Try out whiteboard. Uh. So we will um. Right so everyone's to uh supposedly uh draw their favourite animal over on the white board over there. I guess this is uh make sure the whiteboard works. So uh I don't know who wishes to go first. Do you wish to go f Have a first bash at uh whatever. Ah uh. But now you you uh you'll move out from the microphone and the camera. I take it that I would I would guess so. Or Technical problems. I mean you designers are meant to come up with these sort of things. Next. I don't see as there's any need to. There's plenty of space. I mean whatever. Exactly. We've had more time to prepare over this side, so we've all stuck our bits and pieces in our pockets. The three pens are underneath. You get marks for artistic impression. So you're just doing the face. Right, um. Well I've not actually had too many pets uh over my uh time 'cause to be honest with you uh I'm not too keen on them anyway. Not to worry. So what my daughters have got at the moment is they've got uh a few fish and so hopefully um won't prove too difficult to draw. Uh As you can see that my artist artistic work is useless as well. Anyway um. And uh one of the best uh things about fish is that they don't really take uh too much looking after because uh with most of the animals if you're going away on holiday or whatever, you've gotta spend money or get a friend or whatever to look after them for you. Whereas if you got fish, you just gotta put the food in a a a dripper feed which feeds them over the uh couple of weeks that you're away and uh change the water every couple o

f months, and buy in a few plants, so. Other than the fact that they keep dying, uh fish are uh are not are are are reasonable pets in that uh they're low maintenance. Right. Okay, uh if we're still all with us. Right okay, so. Work has been done on uh this uh project where by um twenty five Euros is uh the uh expected uh selling price. That information has come from our marketing manager here. So we're looking to sell internationally, not just in Europe. We're looking at um having our production costs limited to uh twelve and an half Euro per unit. And therefore making a profit margin of uh well not actually a profit margin it's uh because obviously you're gonna have overheads and various other costs to uh take uh from uh from that to give you your profit margin per unit. And so depending what the uh the overhead uh costs are will determine uh how many units we're uh looking to sell or projecting to sell at this point in time. So um Experience with remote control, first ideas. New remote. So I guess we're looking at um having a discussion at this point in time to help uh you um folks design our our new model as it were. So uh any any thoughts? Okay, so so basically we're looking for some um we're looking for a device that is um robust and and therefore uh won't get damaged too easily. Um we're looking for a device that is uh What was the other things you said there? Easy to use. Use. And see. Okay. Uh. Mm-hmm. Oh I w um basically I'll get back to you on that. But it seems to me sensible, 'cause as you rightly said, there's nothing more annoying than having three or four devices littered about the uh about the room. And uh So a device for for all remotes. Hmm. But is it in a sense it's r um mutually exclusive. You can't have both the th the one device and then have few buttons on it to 'cause

you want you want simplicity as well, you want any idiot to be able to use it. Whilst at the same time you want, as you rightly said, one remote for all. And so these are probably mutually exclusive options that uh Hmm you could argue that experience of using devices and similar devices as people get more and more used to using remotes, therefore they're more with handling them, therefore you can make them more complicated as time goes on. Better instructions. Mm-hmm. Okay. Um well we've got five minutes before the end of the meeting. So uh we have to uh start winding up. Um is there Next meeting in thirty minutes. So um Right, so we've got I\_D\_ the Come on, where's my Oh there we go. Yeah. That's what I was looking for. Right. So we've got function Oh what happened to the Right. Right. Sorry about that. Okay, so we've got um the working design for I\_D\_. For U\_I\_D\_ the technical functions design. Marketing, the user requirement specification. Specific instructions will be sent to you by your person by your personal coach. So. Are we all clear what objectives we're looking to meet in the next thirty minutes? And I guess I'll try and write up some minutes of uh this meeting to uh to give it to you for the next meeting. Television remote control. That's true, 'cause during during the course of our day we might make decisions based on information or meetings that would change where we're going. But at this point in time I think you're right that uh shall we make it just a T\_V\_. Okay? So we will depart. We will stay here and uh and break off. And I'll do minutes and and we'll see you in half an hour. Okay. Right s

---

# Meeting ID: 85

Data Source: Train

## Executive Summary

The User Interface Designer presented the basic functions of the device and discussed the designs of two existing products, showing an example of the simple design that the group wants to implement. The Marketing Expert presented feedback from users, showing that users want a simple but fancy-looking remote control and that young users want speech recognition. She discussed including only the most basic functions in the interface. The Industrial Designer presented her internal design of the device and discussed the processor chip and the energy sources that will be integrated. She suggested integrating an extra lightbulb that lit up when the remote was communicating with the television. The Project Manager gave the group new requirements for the product design. The group discussed marketing the product to a wide range of customers. They had a discussion about possibly including a locator function and speech recognition. They discussed integrating the company's yellow color and logo into the design, and decreasing the number of buttons in the main interface. The Project Manager instructed the Industrial Designer to prepare the components concept, the User Interface Designer to prepare the interface concept, and the Marketing Expert to prepare a trendwatching report.

## Complete Meeting Transcript

Okay. Um welcome to our second meeting. This is the functional design meeting. And I hope you all had a good individual working time. Okay, let's get started. Okay, here's the agenda for the meeting. After the opening um I am going to fulfil the role of secretary, take the meeting minutes. And we're gonna have three presentations, one from each of you. Then we're gonna discuss some new project requirements. Um gonna come to a decision on the functions of the remote control. And then we're gonna close up the meeting. And we're gonna do this all in about forty minutes. Okay. First I want to discuss the goals of this meeting. First we need to determine the user requirements and the question that we can ask ourselves is what needs and desires are to be fulfilled by this remote control. And then we're going to determine the technical functions, what is the effect of the apparatus, what actually is it supposed to do, what do people pick up the remote and use it for. And then lastly we're going to

determine its working design, how exactly will it perform its functions, that's the whole technical side of 'Kay I'll just give you a minute, 'cause it looks like you're making some notes. 'Kay. Oh, well let's go ahead and, back, previous. So what I wanna do right now is hear from all three of you, on your research that you just did. Who would like to start us off? 'Kay. Okay. Um do you have a PowerPoint or no? Okay. Oh. Save it in the project documents. Okay. Mm-mm-mm. This one? Okay. Okay. Okay. Right. Ready. Alright. Very good presentation. Thank you. You speak with such authority on the matter. Okay. Who would like to um follow that one up? Now, that we've discussed Okay. Do you want me to run it or you wanna Okay. Functional requirements. 'Kay. Alright. Now we have Courtney with the functional requirements. Okay, what do you m Oh, I'm sorry. What do you mean by um the current remote controls do not match well with the operating behaviour of the user, like they have to press the buttons. Okay. Oh, right. The buttons. Okay. Yeah. Okay. It works. Ready for the next slide? Hmm. It's okay. It's very important. Could be, yeah. Oh. I think that's a pretty good guess though. Yeah. It's okay. Okay. Next slide? User-friendly. And so just to just to clarify by speech recognition you mean they would say, channel five, and the thing would go to channel five? Okay. Oh, that'd be lovely. Didn't they um didn't our rival companies manufacture a remote that you would press the button on the T\_V\_ and it would the remote would beep so if you have lost it Mm. Oh, yeah, that's true. We could definitely include that if we wanted to. If it's within our price. Okay. Are we ready for our last presentation, Amber? Okay. There we go. 'Kay. Oh my bad. Okay. Ready? That's okay. Hmm. So this would be the front? So the red would be the front of the remote though, right? Okay. The l the light up kind of Yeah. Hmm. It'd probably be lighting up the key too, right? 'Kay. The buttons. Okay. Yeah, definitely. 'Kay nex R Ready? 'Kay, any p 'Kay? Anything you wanna add for personal preferences though, you f you said already that we needed a large on-off button, you think. Anything else? Okay. Mm. Okay. Okay, let's talk about all of our We'll come to decision later about all the components that we need to include, let's um wrap up this one, and I'm gonna go back to my PowerPoint, 'cause we need to discuss the new project requirements which you might've already seen flashed up on the screen a bit earlier. Wait, come back. Alright. Sorry, let's go through this. Alright. Here we go. New product requirements. First it's only going to be a T\_V\_ remote. We're trying not to over-complicate things. So no D\_V\_D\_, no TiVo, no stereo. It's not gonna be multi-functional. Hey. And we th need to promote our company more, so we need to somehow include our colour and our company slogan on the remote. We're trying to get our name out there in the world. Okay. And you know what teletext is? in

States we don't have it, but um it's like they just have this channel where just has news and weather, kind of sports, it's very um bland looking, it's just text on the screen, not even Yeah, just black with just text. Yeah. Kind of. Yeah it's the whole screen. So anyway Right. Right. But it's becoming out-dated now, because of the Internet. Nobody needs to go to the teletext channel to check the news, and we have twenty four hour news channels now too, so Those are our new product requirements. Alright. Mm-hmm. Yes. It's part of the logo. Okay. What we're going to do right now is come to some decisions, definitive that we can all agree on, about um the target group and the functions and just definite things that we need to do and then we'll close up the meeting. So. Alright. Whatever. Okay. So our target group is You mentioned um older people? Would it just be universal for everyone, you think? Because I think even if something has large buttons, as long as they are not childishly large, like even technically non-technically challenged people are gonna use it. I mean they want something user-friendly, so Yeah. Yeah. Okay, so we want um for our target group would we say, I mean, young and old, all age ranges, all um, not kids obviously, right? Or kids? Okay, so we're going to go anywhere from kids to adult in the age range Um what about technic technical um specifications, like how how technically

literate are these people who are going to be using our remote? Okay. Right, okay. So so they need no technical experience to operate Okay. And we also need to determine the specific functions of this, just to get it all out on paper. So we said it needs to send messages to the T\_V\_, needs to change the channel, turn on and off, just basic simple stuff like this. So if you have something just say it and we'll add it to my meeting minutes. Mm-hmm, volume. Right. And we wanna keep um I'll make a note here that we wanna keep the number of buttons down. Correct, because people only use ten percent. 'Kay. Hey, what else? Um. I think so. What do you A finding kind of device or Yeah, ho homing device. Mm 'kay. Okay. Right. Hmm. Would that add to our costs at all, I wonder? Right. Okay. I I think we can make a decision about that later. Uh we'll still put that as a point that we need to discuss. So that would include battery source Power source rather. Is it going to have a charger, or is it going to be run strictly off batteries? And we also need to deal with the issue you mentioned of speech recognition, if we want that. Mm. You could um we could hook it up. Oh. Mm-hmm. And if and if we introduced it when they're this age, they're going to probably always buy a remote that has Right. Yeah. and the speech recognition could be part of the lost and found device, too. If we said, find remote, locate remote, or something. A certain phrase then it could beep. I dunno. Just throwing it out there. Well Okay, anything else we wanna discuss? Um. How how, yeah, how would you leave those out? Unless you could say the channel. Yeah, that's true. And also remember that in this day in age we need, you know, like a hundred button, too. I used to have a remote that did not even go up past like fifty. So I couldn't whenever I got cable, I had to get a new T\_V\_. Mm. get your own remote, or digital cable. 'Kay. Um. I guess, we're gonna discuss the project financing later, making sure that we can fit all of the stuff that we want to on our budget. Um. 'Kay. And don't forget we need to include the colour of our company and the logo. I'm guessing. And the R\_R\_. We could just have the logo in yellow, or maybe a yellow light for the keys. Right. So we've simplified, we don't need all those um play, fast-forward, rewind, or no menu buttons. So we've pretty much pared it down to on-off, volume, mute, channel up and down, um the numbers Yeah. Um can we go back to I'm gonna look really quickly back at those examples and see if there is anything. Which one is yours, t

echanical functions or functional requirement? Okay. The T\_V\_. I think that that's fine just for the T\_V\_. I mean how often does the average user need to do that kind of stuff? Hmm. Couldn't we do that all through one button, something, a menu button, that pops up with a menu on the T\_V\_ that says, you know, audio, video, whatever, language, you know? For the menus. That's true. Something that looks mayb you know. Y right, right right right. That one? Right. In the middle perhaps. Yep. good. Anybody have anything else they'd like to bring up in this meeting? Okay. get out of here. Let's go back to the meeting closure then and see what we need to do next. Mm. Alright. After this meeting we're gonna be sent a questionnaire and summary again which we need to reply to that e-mail. And then we're gonna have lunch break. And after lunch thirty minutes of individual work time. Um I'm gonna put the minutes I put the minutes for the first meeting already in the project documents folder, if you'd like to review them. And I'm gonna type up the minutes for this one as well. Um here's what we're each going to do. The I\_D\_ is going to work on the components concept, um U\_I\_D\_ the user interface concept, and you're going to do some trend watching. 'Kay. Specific instructions will be sent to you by your personal coach. And if anybody has anything they would like to add? No? Okay, well, this meeting is officially over. Thank you all. I don't mind going first. Yeah, it's in the should be in the m Project. You know you could you could do it yourself actually. Put it in Project Documents, yeah. Sure. Yeah. Okay. Um well, the function of a remote control, as what uh we've been informed, is basically to send messages to the television set, for example, switch it on, switch it off, go to this channel, go to channel nine, turn the

volume up, etcetera. Um some of the considerations is just um for example the what it needs to include it's the numbers, you know, zero to nine, so you can move to a channel, the power button on slash off, the channel going up and down, volume going up and down, and then mute, a mute function. And then functions for V\_H\_S\_, D\_V\_D\_, for example, play, rewind, fast-forward, stop, pause, enter. And enter would be for like, you know, the menus. And then other menus for D\_V\_ as well as T\_V\_, whether that means like um we can go and decide the brightness of the screen, things like that, all the more complicated functions of menus. And we can decide if that's what we want,, um if we want to include that on the remote, if that's something that would stay on the T\_V\_ itself, for example. These are two examples. Um and you can see on the left, it's got a lot more buttons, and I don't know if you can read it, but it says, step, go to, freeze, um slow, repeat, program, mute, and so those are some of the buttons and so it gives you an idea of s one example. And then on the right, it's a lot more simpler, it's got volume, it's got the play the like circle set, which is play, rewind, but it's also what is fast-forward is also like next on a menu. So you have functions that are d uh duplicating. And you have a mute button and then the numbers and the eject, and the power button. So that gives you two different kinds, a more complex and more simple version. Okay. And then lastly, it's just the questions that we want to consider like what functions do we want it to include, and how simple, complex it should be? And what functions it needs to complete. Uh, what are needed to complete insulation process, 'cause, you know, that's something that also has to be considered and it's gonna be hopefully a one-time thing, when you set it up it should be set to go, but we have to include the functions that can allow it to set up i in the first place. So that's it. Mm. Left. Wait. And that meaning what? Okay. Right. Only use ten percent of the buttons. Lost. S Wait, is that like your ergonomics like your hand movements or something? Like Channel, volume,

power. It's like if you're holding it to just say, where are you, and thing beeps, you know. Yeah. It's kinda like what the remote phone used to do. You know like go to the base. Yeah. Working design. Help me. Well, how much extra would the additional chip be? Is that gonna push us over our production costs? Mm-hmm. Yeah, that's gonna be what's communicating with the T\_V\_, but the other bulb, I think, is good to just to indicate, I'm doing something, it's sort of like a reassurance. Yeah. Just Well, should it be larger buttons in general, you know like uh the examples that I had, they were swi quite small. So should we try and go for something that has l larger buttons? Ovals. Yeah, yeah. Yeah. I know. Yeah, it's like black, black and white kind of It'll give you the sports. Except the entire screen. You can pick sports, you can pick the news, you entertainment, you know it's like Yeah. Company colour being yellow. Mm-hmm. It's gonna make it nicer. Yeah. We should go for the lowest denominator. High school educated. Well it's channel, on-off button, volume, mute. Um. Oh right yeah okay. Tracking. But you got a base. Well, if you have the base, you could start putting in a charger and then you have a different kind of battery. Yeah. Well, then we could If we have the speech recognition then we can start aiming at a like another kind of more handicapped disabled uh demo demographic. Well Well, then then do you put the voice recognition do you put the r like receiver on the actual television, in the base, or in the actual remote, 'cause then you've already got remote in your hand, why you just gonna speak to the remote, whereas if you just speak in general and you don't have to have the remote in your hand and like talk at it. Still fifteen minutes. Um. Well, do we wanna include the numbers like zero through nine? Can we conceive of leaving them out? Yeah, like you have one, two, three, four, five, six, seven, eight, nine, zero. Well, I don't know, I mean, if you can like well I don't know, if there's just a way of leaving them out? The colour being yellow? And how do we Can't make it entirely Well if you have like a Hang on. If you have this sort of strip kind of down at the bottom the base of it, just like yellow with the R\_R\_.

Right, yeah. Two examples. Yeah. Oh, it's a Yeah. Well, the other option is sort of like down at the bottom, like farther away, you just have this sort of box inset where it's like the buttons that you don't use as much, but occasionally you will use. and so it's like I don't well, I don't know. Right. Well, that could be No you could just double up with like the channel or the volume buttons. Channel is just up and down. And then add a Yeah. So we just have it like add a menu button then for the various things needed, including v voice recognition if we have any like settings for voice recognition now included in the menu. Did you send it? Okay. Great. We only use ten per cent of our brains. yeah. Do we really need t to provide more information on what R\_S\_I\_ is? Yeah, I'm just trying to move it. 'Kay. I think it should be there, working design. 'Kay. Uh I didn't get a chance to complete this one, 'cause some of the tools that I was given were frustrating. Uh okay, so method method of our design, I think I just start listing th some of the things that we actually need to put into this. We need a power source, we're gonna need a smart chip if we're gonna make it multi-functional. Um extra functions will probably need an additional chip. Either that or the smart chip will have to be extremely smart. Usually a smart chip is just a chip that's been programmed and designed so that it can complete a fair range of functions. I wouldn't think so, 'cause we could probably get it from like, in bulk, from a a newer company. And they tend to sell their chips pretty cheap. Um yep, nothing here. Um power source, I figured, batteries, 'cause they're easily available. Typically a remote has either two double A\_s or fo

ur triple A\_s, sometimes three. Uh it really kinda depends on the size of the actual remote itself. Um a large on-off button, demographically we're moving towards an older generation of people, so a large on-off button would probably be good. Selection button for various entertainment devices, so you want something that will permit you to select the D\_V\_D\_ player or the T\_V\_ or the stereo system. Um smart chip that perverts uh that permits, sorry, universal application again, something that'll allow us to skip over between devices, and that's kinda it. Uh this is my fifty second design. Power source over here. We're gonna have a switch obviously between the power source and the rest of it, and you're gonna need the switch. Um extra bulb could just be for flashiness, um subcomponent which would be like a way of diverting the power to different parts of the the device. Um the chip and of course the infra-red bulb, so it can communicate with the various devices that it needs to talk to. This is just like a rough schematic. So this is the internal workings. Yeah. Yeah, so you don't have to stare at that infra-red, 'cause you know when the battery starts dying in your remote currently, you have to actually stare at that bulb and go, okay, when I push this button, is it working? We can skip that whole thing. Yep. So you can put it in the dark. Yeah, that's it. I think that that's a good idea, because you know that's one of the most important buttons. Okay. You can also get the kind of the T\_V\_ guide so It's the entire screen is just running information at random. Seemingly. Okay. So, do we have to include the company colour within that? Mm well, even if we kept the regular standard size of remote, if we reduced the buttons down to the ones that people are saying that they use the most often and a couple extra, 'cause they're saying they only use ten per cent of them, then we should be able to accommodate fairly decent sized buttons. Most of them will intuitively pick it up though. how 'bout little to no, because there is no way that you are gonna be able to make it no. Do we want this thing to be able to be found easily? And like if this is gonna get lost underneath the coach, how are we going to accommodate the quick ability to find it? What if we gave it a charger? And on the charger, just like a phone, like you get a portable phone and it's got a charger, and if you d leave your phone somewhere, you push the button to find it, and it finds th the phone beeps for you. It's useful for the remote phone. Yeah. Rechargeable batteries are cheaper usually. Yeah. I think people would find that too foreign. It's when we get satellite. Yeah. Yeah, 'cause I don't have any material pricing information available to me at the moment, so R\_ the double

R\_. Or is the I Yeah, yellow could be and it could doesn't have to be huge. Mm-hmm. I had something, but I forgot. Do you want us to do our PowerPoints now or I can go. Yeah, you should run it. Mm yes. Yes, okay so we tested a hundred subjects in our lab, and we just we watched them and we also made them fill out a questionnaire, and we found that the users are not typically happy with current remote controls. Seventy five percent think they're ugly. Eighty percent want they've are willing to spend more, which is good news for us um if we make it look fancier, and basically w we just need something that really I mean there's some other points up there, but they it needs to be snazzy and it but yet simple. So that's really what we need to do. And we need we need it to be simple, yet it needs to be high-tech looking. So Like They like I guess use the buttons a lot. Yeah. I don't know. It's from my uh research. My team wasn't very clear. That's okay. I I think it's like the engineering versus user, whereas like the engineering she showed that the engineering ones are more complex and users don't really need all of the buttons that are contained on there, because they only use ten percent of the butto

ns really. Good point. It's a necessary evil. Mm-hmm. And so people say that they typically lose it, as you yourself know, because you probably lose your remote control all the time, much like any small appliance like a cellphone, and they we need something simple, because most people, well thirty four percent say that it's just too much time to learn how to use a new one, and we don't want to go we don't want to vary too far from the normal standard remote, but I mean they do need to be able to identify it, and R\_S\_I\_, I'm not very sure what that is. Yes, it is important for the remote control world. Sh Uh possibly. Uh yeah, that's what my web site said, I don't know. Yeah, I would assume so. I think we're supposed to know it as remote control experts. But also s so the channel, the volume and the power buttons are the most important on our company website you can find like the specific statistics concerning to how much each button is used, but those are the definitely the top ones. Yes. And so personally I think that we need a modern eye-catching design, but it it really needs to be simple. So saying from y your slide, your presentation, the engineering versus the user-specified remotes, I think that we should go with something that's more user-friendly. Where the engineering ones, the boxes, tend to make it look more complicated than it really is. Um the functionality of the product really needs to be considered as to like what type of buttons do we really need on it. And it needs to be open to a wide range of consumers, so even though we need a small number of buttons, we also need to take in like are most people going to be using it for a D\_V\_D\_ player, a TiVo, what what exactly are we using it for, as well as the age range. So we need a hip, but not a corny marketing scheme for promoting our product. And also we found our team found that speech recognition is it's like an up-and-coming thing they really consumers are really interested in it, and since our findings found that people are willing to pay more money for a remote for it to be more high-class we could consider it. I guess so, yeah. Yeah, I guess we can interpret it like, we can just try out different types of speech recognition within our remote programme. Oh that's fine. What exactly is a smart chip? So what exactly we are looking at, is this like the front of the remote? Oh okay. Like that we know the battery's working. Okay. Yeah. Yeah, and that's good. We should make it glow in the dark. Mm 'kay. I think we should. Like I think that would be in a as in like in for the design, sorry, um. I think we should definitely go with buttons that don't look like a normal remote, 'cause most remotes have small square buttons, I think we should do something like maybe bigger and round like bubbles. What is it? Like running along the bottom? Wait, is it like the Weather Channel where it's got like the ticker running on the bottom or something? So it's like a separate channel from like what you're watching? Okay. No, kids need to know how to use a remote, I would think. They gotta change between Disney Channel, Cartoon Network. Yeah, I think we need it all. Um I would say we should say dumber than the average person. Yeah. And channel. Yeah. Those are

the most important ones. Yeah. Sure, yeah. I need we we need a like homing device. Because people really are looking for a remote that's more high-tech. Do you think people'll really go for that though? Because Yeah. I would think so, because you'd have to develop a base. Hmm. Right. Do w Well, th there's the people who desire speech recognition, there's the different demog demographics have different desires, I don't know if you guys ge It wouldn't copy onto the the thing 'cause it's black, but all the different age groups have different desires for speech recognition. So basically older people don't really care. It's really the people twenty five to thirty five. I feel those are the people that really watch a lot of T\_V\_ t

hough. They're the ones that get addicted to soap operas and just sitcoms and stuff. Right. So Right. Yeah. Wait, on the remote itself? Well, we definitely need those. Yeah. You definitely need Wait. I feel like a ye I feel like a yellow one would be too garish. Or put like stripes, oh yeah, yellow lights. Yeah. Yeah. Yeah. Yeah, audi audio settings and screen settings, we need those like audio settings mono, stereo, pitch, screen settings like brightness, colour, or do we just want that accessed accessed from the television itself? Yeah, 'cause we need to we definitely need to have buttons for like sub-titles and things like that. It's 'cause the foreign film market is expanding and stuff, and like on television like I know f k living in Los Angeles it's tons of Spanish network television if it has English sub-titles it's definitely helpful. So we need up, down, and side-to-side buttons. Yeah, okay. Okay, yeah. Such as, yeah, the one the one over there on the left the engineering centred one. Ooh, I just got an idea for a design.

# Meeting ID: 42

Data Source: Train

## Executive Summary

The project manager stated that the goal for the current meeting was to decide upon a concept for the remote the team is creating. The marketing expert discussed his findings from trend watching reports. He found that current trends are such that a product must have a fancy look and feel, be technologically innovative, be easy to use, incorporate a fruit and vegetable motif, and must be spongy. The user interface designer discussed how to create an interface for a remote that is easy to use. The user interface designer discussed the placement of commonly used buttons, the overall shape of a remote, and how to hide less commonly used buttons. The industrial designer discussed various components and energy sources the remote could include. The industrial designer focused on the use of a TFT screen and the use of solar cells to supplement the energy from two regular batteries. The team then discussed and made decisions regarding the option to use solar cells, the specifications of an LCD screen, how to incorporate a fruit and vegetable motif into their design, and how to hide lesser used buttons.

## Complete Meeting Transcript

Hello. Okay. Okay, I'll start. Can you open my presentation, please. I'm number four. Trend. Yep. Can you pass the mouse, please. Oh okay, that's fine. Okay. Um so basically I just want to presented to you present to you some recent results we've had from um looking at uh um some remote control market research and some fashion trends around the world. Um the fashion trends we got from talking to our our contacts in the fashion industry based in Paris and Milan. Um so f from our market research basically we've come to the conclusion that a fancy look and feel, um as opposed to a functional look and feel, is our number one priority. Um fancy is is is is the, you know, highest priority. Secondly um that our remote control needs to be techn technologically innovative. Um so this is t number two priority but it's two times less important as the fancy criteria. Um and third thirdly the easiness of use is is the um is is important as well, but again two times less important as the technologically innovativeness of the remote control. From our f fashion people in Paris and Milan, um we've discovered that this year um fruit the fruit and vegetable motif will be the most important thing in in clothes, shoes and furniture. So,

I'm pretty confident that our remote control fits into the furniture category. And also um the feel of material this year um is expected to be spongy. Um so hopefully our remote control reflects that s in some way. Uh sort of um squishy. Um. Yeah soft, like a uh like a sponge. I don't know. Yeah. Um so in conclusion, we need a our remote control needs to be something that's really fancy, um has lots of technolog tech technology in it. Um somehow would be good to have it related to fruit and vegetables with a spongy feel. And that it's easy to use and from our last meeting our you know Fabian told us that w you know one of the requirements is that we have to reflect the look and feel of our of th the Real Reaction company. Um. That's it. Less important. So um fanciness first and then two ti you know, half as important as that is technology technology, and half important as technology is easy to use. So. Inch. So So Ca Can I ask a question. This seven inch T\_F\_T\_ screen, how big is it in reality? So like that. That's quite big. Uh uh have we decided that we're gonna use this T\_F\_T\_ screen? But I mean even even that is like this big. Yeah. You can cut the T\_F\_T\_ screen. Okay, so Okay. So, what's the size of the device? Even from my perspective seven t seven centimetres by seven centimetres is still Is it Can you hold that, or? Yeah, a small c control that they can hold in hand. But is something that's seven centimetres square e easy to hold? Okay. So if we use s solar cells, um where is the sun if someone's watching T\_V\_ inside? Okay. Okay. It's it's quite innovative, yes. And if you watch T\_V\_ outside it's very useful. Which is the same area. Could you re could you redesign your board? Oh, five five centimetres by ten centimetres. Yeah. Mm, touch screen. So Well it's it's definitely the obvious choice, with the colour of our company. I mean what other what other fruit and vegetables Do you know of any any other fruit and vegetables that are yellow? Well I'd like a shaped screen. I think that's more important than saving a bit of money on on the T\_F\_T\_ screen. Yeah, banana's good. Okay. I think if we if we have a spongy layer on the outside of the banana then it's easy to make that, you know, to manipulate that to hav be a cover that you can pull off and I think for sure. Definitely. The softer the better. Yeah. We could use Velcro. Or uh ma maybe a magnetic thing. Yeah, I imagine some sort of vinyl thing. In a in a sort of a with a suede sort of feel. Maybe. Mm. So you're saying is it possible to have a solar cell and this removable cover and And a and a banana. Yeah. Okay. I think it's important. I think One of our p priorities is tech technology. And Mm-hmm. Yeah. Okay. Okay. Thank you. Hello, uh this meeting we ar

e it's fo should be focused on the conceptual design of the remote control. Um the goal of this meeting is to reach a decision at the end on the concept and I think the last time we talked about an a lot and we had a rough idea of what is going to be, but uh in th at the end of this meeting we have to to reach a decision. So, uh we will have again three presentation, from all of you, and uh I hope it will be fast because I would like to have time to for long discussion and and decisions. So, who wants to start? Okay. So start, uh Uh. This one? Turn. Hmm. Okay. Like a sponge. Yeah. Yeah, uh yeah. Easy to use, is it uh a as much as important than technology or fancy thing. It's less important, right? Yeah yeah. Okay. So, Hamed, can you. Mm-hmm. Um. Number? Three. This one? So it's not this one. Okay. Yeah. This one, yeah. Oh,. Oops. Can you fit any uh for example a T\_F\_T\_ or any electronic device in a spongy thing, or is there any problem for that? For example, put electronic card on a spongy thing, I can I can imagine it could be a problem. Yep. Okay. So Okay. Maybe put electronic in a box and a spongy thing around. maybe after. Yeah. No, I don't think it's seven by seven, I think it's seven the diagonal is seven. Usually when they say seven inch I think it's the diagonal. Yeah. I dunno I dun I dun One each. But, yeah,. Let's go. So let's cut the T\_F\_T\_. Mm. These technical engineers, huh. What user wants. He wants a small remote control, or? Uh uh with big buttons. It's difficult. A sm So maybe you can finish your presentation, and afterwards we will discuss about all this. That's it. Okay. So. No. Uh, so I think

we have a lot We have to take decision today, so I think we have to do some work to finalise our idea and take decisions. Uh first I think energy it's a key problem because uh it depend what can we have as feature if we use only batteries, for example, or something like that. Because can we have L\_C\_D\_ and speech recognition with battery, and it's also r related to the size of the of the devi of the device? Okay. So Okay. Uh like but using how many batteries, for example? Are are what Maybe what is the size of the battery Okay. Uh one two Okay. The television lights. At least when there is T\_V\_ you can get light from the T\_V\_. I dunno. Okay. Mm. At least it's new and maybe technology New technology. Yeah. Um. So I think before talking about the other thing, it's important thing it's the case. Uh what what are gonna be the size, because its weight drives the other what we are going to use as features and so on. For example for the for the L\_C\_D\_, if we choose to have a small device, we cannot use this um a such a a screen. Oh. I've I s I think the easiest thing would be to to have a smaller L\_C\_D\_, if it's possible. Okay. So we are agree with a small L\_C\_D\_. Yeah. Tactile or something, yeah. Touch screen, yeah. Yeah. The problem is we have a limit in a month of time, so we cannot do something very new. So let's go for a small L\_C\_D\_. Yeah okay. So, five by s ten. Um so what about, so the case we talked about. Um something easy to use, you said something easy to use but how does that fit in a fashion way, like with fruit and vegetable, and about the colour and logo of the of the company and so on, now, can we do that? My first idea is because our colour is more yellow, and the it should be easy to take in a hand, I thought about banana, or something like that, which is fruits, and A big banana. Um. Yeah. Yeah. But it's just an idea. I dunno what you think about, but Yeah. I dunno if it can fit with the technology. You are the specialists of that. So Yeah, and The screen has to be square? Or it can be like a a shape, quite, uh with curves. It could. Yeah. Okay okay. Yeah. Yeah, it should remember banana, but it's not doesn't have to b to be uh uh really the size and exactly the shape of a banana. So we are agree with the banana thing? Okay. So, the last point we decided it's infra-red, I guess. Everybody's agreed. Uh,

so that's it I think about the concepts. You have other thing to add to this point, or uh no? So, uh about the user interface, so we are going to use L\_C\_D\_. In the last meeting we talked about uh hidden buttons. I don't know what we are going to do with that. You talked about the buttons on the side Mm what? Yeah. Okay. And you mean the first layer would be spongy. So Is it is it possible to do that? It would be a great idea, but is it possible technically? Like doing a spongy layer of the banana, and you open it. Yeah. Yeah. Yeah. Yeah, but do you see that as a rigid thing, or like like a banana, something very soft, you can open like banana, or. Yeah. So, I dunno what you think, Bob, but it would be great for users I think, and very good for marketing. Yeah. Yeah. Um. And setting buttons hidden in. Mm, other remarks, or something, or. Something we didn't talk about yes yet, or. I think we are almost there. Uh maybe, how can we, if we have a soft thing, like this, and to open it we have to attach it somewhere, I dunno how to do that technically, or. And how Yeah, maybe. Ma magnetic oh. Okay. Okay. And what would be the matter here of the first layer I mean? Mm. Likes. Soft plastic, or Yeah, yeah, yeah. Hmm. And something we forgot, maybe, uh about the speech recognition system, are we going to use it, or not? It i Yeah, it seems feasible, and it would be something very great. So we have the de design, the a good shape, new and so on, and we have also the technology thing w will be. And even the easy to use thing, so it will be perfect. So we add also the speech recognition device. So, that great. We have decided everything. And think we are on a good way. So, um uh the next meeting will start in thirty minutes. Um, so uh the the Industrial Manager uh will uh will work on the look and feel design. The User Interface uh uh Mana uh Manager will work on the user interface device. And the the Marketing Expert will do the first project evaluation. So, I hope you can do that in thirty minutes. And uh, yeah, I uh I think you should work together, s you uh Hamed and Peter, to work uh in a in a first prototype, and uh

more about the shape and so on and how you can manage to put everything together. And um as usual you will receive some specific instructions on. So thank you all everybody, and see you in thirty minutes. Mm-hmm. Hmm. What does it mean, spongy? Like soft, or something? Okay. I will see. Okay. I think the biggest struggle will be the easy to use feature. We'll see. Exactly. Uh okay, so good news from me uh uh for me from Hamed, but bad news from Bob obviously, because spongy design, I don't like it as Okay, so could you please, Fabien, open it. I'm person two. And which one, uh probably the first one. I'm not sure but check the first one. I Most of the things I have to write myself on the board, but Yeah, that's it. Just It's only this slide? Yeah. This this is just uh one thing I wanted to mention and show you that I just uh I just found this, that our company uh developed a s a seven f seven fingers or I'll just Yeah, seven seven inch T\_F\_T\_ screen, which is good news for us, since we wanted to include a display there. Uh so I I probably draw it down raw scheme. This is this is the stuff that I can use to Okay, so the this will be like the overall scheme or overall requirements from the engineering point of view. Uh first thing is uh this will be the overall shape, no uh I'm not speaking about the real shape of the device, but the shape of the inside of the device. So there will be some circuit uh for the power. So, say power circuit here. Uh the main energy will be taken from batteries that we can uh uh And if we decide to use the speech recognition stuff there, we must use additional source of energy, which I found the best is to use the solar cells which can which can uh supply everything. I was computing all the all the things related to the speech recognition, and it's okay to use just uh two batteries and solar

cells, so. So no problem. There can be also solar cell. Uh the main board with all the circuits will take at least seven to seven centimetres, so this is my like hard requirement for the guys from the design. So at least seven to seven. It depends where you put your screen, because the screen is uh seven inch, so it depends on you where where you put it. It doesn't matter. Um it's just one cord from from the main board to the screen which can be elsewhere. So this will be T\_F\_T\_. And on the main board we have the um interface to the microphone, which is somewhere, say here. Interface to the microphone. Then the graphical card uh for the T\_F\_T\_ and the third unit is the I\_R\_. The good news is that we can uh we decided to use the infra-red unit because our company has also developed the chip for communication by the infra-red, including all the stuff inside, so it will be very cheap for us. So infra-red here. So the once again the overall requirements, seven to seven centimetres for the board, which has to be which can be spongy but has to be this size, and the T\_F\_T\_ which is seven inches. Um I have to check what I wanted to Uh from my point of view I don't care about the about the material used for the overall des uh ov all the device. A all these things in in uh in this box are okay to put in in any shape, basically. But we have to take care of the T\_F\_T\_. Well, sponginess. Maybe it a good feature, since it takes if it's around the T\_F\_T\_ then it's good, because it's just keeps it safe, I dunno. Well, it's maybe related to the U\_I\_. A Yeah, that's all from me. Yeah? Well, seven to seven inches. Yes. Yeah but To be honest, I was Yeah, honestly speaking I was thinking that it was seven centimetres initially, but it's seven inches. But I I think we can we can cut it. Yeah, no no problem, because because because then the size of the graphic card will be one fourth. So Yeah, but no problem to to me to cut the screen. So so for the same price we have four screens now. Ah well this is like this is almost nothing. Seven to seven to at least well some three millimetres or something. Yeah, but we wanted the big buttons and stuff like that, you know. Because if it's t too small we can we can lose it, at home, you know. I thought that it it should fit in the hand or something. W I I think so. I if the roller buttons are on the side you don't have to catch it like that, but just like this, and you know follow follow Well, that's that's no task for me, but well seven to seven at least yeah, but Oh, okay. Okay thanks. Not J uh just a point to the energy th things. If we use the batteries, and the additional so solar cell, then it's okay for L\_ uh speech recognition and L\_C\_D\_,

so no problem in energy, I think. But we have to use the solar cell. Otherwise not. Yeah I was thinking just common A\_A\_ cells. So like three to five centimetres, I dunno exactly, but. S Uh d doesn't need to be sun. It it's just the daylight, you know. Yeah well I I suppose that I suppose that uh that this remote control won't be in the in the room like this, where there is light only when when there are people, but. Yeah from the T\_ I don't think it's enough, uh. Ah it's a it's a compromise, no? Yeah, that's why I wanted to to include the speech recognition, because you wanted all the new things. Uh the s the screen is okay, but the board, uh that's the problem. Well what what would you guess as a shape? Or what what would be the shape? Mm. Okay. Okay. Five to ten. Well that Yeah, right. Yeah, I think it's feasib Well one um um How could we do it? We could put the board next to, well, under the L\_C\_D\_ and for example make the L\_C\_D\_ be totally unrelated to the thing that you hold in your hand. Like holding something, and the L\_C\_D\_ to be just on top of it, you know somehow. Well But maybe let's stick to the s spongy thing, like one unit. Well fi five to ten it would be feasible. Okay, so five to ten, I I think it's it's feasible. I'll make it. Fo Five by ten. Mm-hmm

. Okay, so Yeah, so so just just give me the the the five by ten numbers that you find the best and send it me and I will work it out. Hmm. Seven to ten banana. Okay. Rather mango or something or. You mean banana. Well, but If it's If it If the banana is big enough. Then, yes. But if you want to look at the screen, no. Well Well, it can be whatever you want. But if it's square then we get four screens out of one by cutting just. But if you want some shape then we can only get like two screens out of seven to seven inches, so. It's like more more expensive to have shape like that. But I don't care. You know, if we fit this requirement. Okay Yeah, m maybe the banana could be like a bit uh fatter than than the c c common one. But Like modified banana, okay. Well it we'll stick to banana, or? Okay. Mm-mm. Yeah, yeah. Sure. Like like peeling of the banana you s It would be cool, yeah. Peeling of the banana, you know, should should discover the other buttons, which are hidden. First layer obviously spo Yeah, w It's it's like silly, but the people will really appreciate it, yeah I think. Well is it possible to make it soft? So I think if it's so then it's cool? Cool. Honestly speaking, I cannot imagine it, so far, but it will be terrible. Mm. Pof. Well since since the since the things like the like the screen and um how to say that, solar cell has to be has to be like kept kept in the shape, we cannot b uh So we need that the that the peeling uh I dunno but we should we should take care of these two two things. So, if if uh the solar cell won't be visible while the banana is closed, then the material must be able to put the light inside, you know. So that we can reach the energy out of it out of that. It is possible, but, well if it I dunno. I dunno how to how to do it if if t if to if it's better to put the solar cell to the t to the peeling or outside it, or or inside. But then it must be some window there, you know. Yeah. I agree. Okay. Okay. Hello. I s No, no, you you can start. Yeah. The second one. Could you please show the presentation number three. Yeah. Three. Yes. Just Could you please check if it is the first one or the second. Uh, n n no, it's the first one. The second one. Uh yeah. Okay. Okay. So I am going to talk about a little bit about how this remote control should be appear to be more easy to use. I think uh I think the feature easy to use is more important than being fancy, but okay, we can discuss about it uh later. Um generally, generally uh this remote control uh uh should be should be something, in my opinion, uh the first feature is just to be easy to use. So, the more frequent buttons should be larger, they should be placed in a good position uh uh inside the remote control. And uh s uh I can conclude like this, that we shouldn't need to learn how to use it. It should be we shouldn't need to es open a a t book and uh start reading and uh learning how to use this uh this uh remote control. Okay. So what I found out that uh as I said uh I think it's better to put uh more frequent uh uh uh ke uh buttons which are used more in the middle of the remote control, and they should be bigger in size. Uh the shape of remote control should be in a way which can which should be

taken easily in hand. It should not be completely like uh a cube. It should be it should have round edge, so uh then it's easier. And maybe uh just like some toys, some joystick which is easier to take inside the hand. And uh also f uh uh m because because customers doesn't like to buy lots of battery, it should not uh consume lots of energy. Okay. And my personal p uh preference is uh, as I said, uh just putting this buttons in a special places and covered some buttons which are not used uh that much like settings button, like mobile phone. Usually some mobile phone cover the dialling number part, so we can cover these buttons which are not used or uh number buttons for the for the for the can channels, and just put uh volume change or s ch can u

h channel change buttons uh uh in the remote control. And if the user needed to do some more complex task uh he he can open the cover and then change settings or something like this. Uh. And also uh I think if we put some some some some some buttons inside of the remote control it can be used easier. Not on remote control. I dunno if I can explain well. But uh just inside. For example, a sliding or rolling uh uh d uh stuff, if we put it inside then we can easily manipulate with uh thumb. So it can be another uh preference. And uh I dunno but uh I think usage of a speech recogn uh r recogniser can be good. I know that it consumes lots of energy, but if we do it in some way that it asleaps when there is no sound and when it detects some sound it may consume less energy. And I think it's good because it's something new and usually young people like something new. So it may not be very useful but because it's new, people may buy it. Uh I personally think there should be a big difference between uh between something. Otherwise they prefer to buy something which is coming from a famous company, or. Okay. That's mine. Mm-hmm. Well maybe it can have two shells, a hard shell inside and a spongy shell outside. Yeah yes. Mm. Uh. Yes. Maybe this. So but Mm-hmm. Yeah. Hmm. Mm. I think I think their being uh large or small is not important. The only important thing is to be able to take it in uh inside hand easily. So let's say an average size, okay, and it should not be very heavy also. And I prefer to is it shouldn't have a uniform shape, so in the middle it should be a little bit thinner, maybe maybe. So we c it's like like some joysticks. You can take uh some some joystick you can take inside hand easier because it's it's designed for your f uh taking into account your finger shape and your palm shape. So the general shape should be like this. I think uh seven centimetre by seven centimetre is a little bit large. So uh seven not seven but let's say five by ten it's I think it's that's my opinion. It's easier. Yeah. Mm-hmm. Mm. Or uh or I don't know but I don't want to now invent something new, because we didn't discuss about it. So using some L\_C\_D\_s we can touch, so we can remove uh keys and just uh having uh, I dunno the name, L\_C\_D\_ responding to fingers. Touching the screen. Something like Mm like tactile. So But for now if we don't want to use such kind of screens I I think we using a a smaller screen is better, because A smaller s Okay. I think this is not good. Mm. Mm. Okay. Yeah, I think infra-red. Yeah, peeling of the banana. Yeah. Mm. Yeah. Uh Mm-hmm. Yeah, some Something like a plastic cover covering uh some interface, U\_S\_B\_ interface as in the in uh digital camera. If you see it's like peeling. You open a plastic cover and you see some U\_S\_B\_ interfaces, some some interfaces for adaptor. So keys can be uh buttons can be covered like this, with a plastic cover and uh when uh and when you open this cover it's like peeling a banana. So, something like this. Yeah, yeah, yeah it's a lic like a plastic cover, so. Mm-hmm. Yes, yeah it's a good idea. Magnetic. Mm. Yeah or a Yeah it can is it can be a plastic cover uh sticking to the to the all the stuff like uh with magnetic p uh magnetic uh magnetic uh materials in the border, so it's it sticks like refrigerator door, completely. And when you try to open it, it will be opened easily. So you you can be sure that it will not be open while you're uh while while uh you are commonly using uh buttons on the banana. Mm. Mm. Mm. Yes, I think. I think so. Mm. Mm-hmm. Mm. Mm. Thank you.

---

# Meeting ID: 9

## Executive Summary

The project manager opened the meeting and had the team members introduce themselves and describe their roles in the upcoming project. The project manager then described the upcoming project. The team then discussed their experiences with remote controls. They also discussed the project budget and which features they would like to see in the remote control they are to create. The team discussed universal usage, how to find remotes when misplaced, shapes and colors, ball shaped remotes, marketing strategies, keyboards on remotes, and remote sizes.

## Complete Meeting Transcript

Right. I'm Manuel and I'm the Industrial Designer in in this project um. In the functional design phase I'm I'll be dealing mostly with the requirements, um we'll discuss what the prog what functions the the product has to fulfil and so and so on. Um I suppose we'll work pretty much together on that one. Um um in the conceptual design um I'll be pro mostly dealing with properties and materials um of our product. And uh the detailed design in the detailed design I'll be concerned with the look and feel of the product itself, um so we're pretty much working together obviously on the design front here. Okay. Mm. Mm, mm. Right. So Mm. Well there are of course certain restrictions, you can't have it be any form and fulfil all functions at the same time, so there are always the some restrictions we have to apply here. Um however um one question is how stable is that thing supposed to be, that refers to the material, pretty much um. What are we gonna build that thing out of? How sturdy is it gonna be? Do we want it to last longer or rather have people whatever, have to buy one every half a year? Right. Right. One problem you'd get with this design is um the ball is a nice idea because of it's stability really, but of course, since it's a ball, it'll roll, so we'd have to have it flat on one side at least, down here somewhere, take away that part. That's one of the big issues. Also also you risk the hinges here. That's that's um a problem. That's that's interesting of course, but that's of course a weak point, yeah. E No no, uh uh. N n Uh, I'm your Industrial Designer, so i b well, the point is that well maybe I dunno. The shape is perhaps not the most ideal. As as stable as it is, there must be a compromise between um stability and design here, so. Mm. Mm. Well with the one-handed design you also have the the problem of the size w 'cause

you know from cell phones, they can be too small. So if the remote is too small it if it's small it probably looks better, but may not be th as functional. So for that there's So The question is also, I dunno, d do you really always want to open that thing when you have to use it? It's probably going to lie around opened all the time anyway, so I don't know if a lid is a good idea. From stabil stability point of view uh it certainly is, but also you have to face it and take into account the more of these things break by accident, uh the more we sell. So it's don't make it too stable uh. To the other design. It looks cool. Uh functional. Right. Right. Question is what makes those game pads functional? W I think that's pretty much the form for full hand. So it's a round shape underneath that makes it comfy, right, makes it nice, so that's the essential part. Except for that I think we'll not probably not get a get away from some longer design. 'Cause you also have to know which way around to point this thing. You know, all that dif batteries right, and Batteries go weak as well, so um after a while you have to point it towards the uh towards the equipment you wanna control with it, right? So, have to m show which is the front, which is the back. I suppose you could do that. O of course the more technology you stick in that, the more it'll cost, so. Course you can do that. I mean of course it'll be evident after a while or if you look at it, it'll it'll be evident which way around to point it, since you have the the numbers and the and the the buttons and stuff, but um it's rather about an instinctual thing, like you just grab it, you don't have to s look at it, you know, which way around to point it. Otherwise the design of or the the point of putting two sensors on both sides um would probably work. Mm. Let's. Obviously Alright. Okay. Oh, that's not gonna work. Oh, alright. Okay. Okay. Um alright. I'll just put that there. Uh as you all know we're here to create a brand new fantastic remote. Uh I'm Nick Debusk, I'm the Project Manager. Uh we'll just get started with everyone kind of letting each other

know who they are and what you're doing, what your what your role is um. Go ahead. 'Kay. Okay. Um so we've got our opening, our our agenda is the opening, uh acquaintance which we've kinda done. Uh tool training, project plan discussion and then closing. Uh grand total of twenty five minutes we have here. Um so we are putting together a new remote control. Um we want it to be something original. Um of course we're a not only a electronics company but a fashion um conscious electronics company, so we want it to be trendy um and we want it to be easy to use. Um we've got the functional design, conceptual design and detailed design um which basically is is the three of you um. And w uh well um functional design um. Um do we have um any ideas of of maybe d let's just throw out some ideas of what kind of remote control we want to have, and then we can go into how we're gonna design it and and how we're gonna do the detailing on it. So we want it to be um a T\_V\_ remote or I I mean do we want it to to do other things besides just be a a television remote? 'Kay. Mm-hmm. 'Kay. I I think yeah, yeah, r universal remote. Um this is my first uh go-round with creating a remote control, so I think we're all in the same boat here. Um Okay. So we should we should set our remote control up to where it has a uh like a tracking device or or like a a It makes a noise, there's a button on the T\_V\_ that you press and 'Kay. Yeah. Do we want so they're kinda like long and rectangular. Do we want something crazy? You know, we want something new that's gonna stand out. A m a modern so our remote should be 'Kay. Um. Okay so yeah, so we want it to be sturdy, we want it to to hold up to somebody's child, you know, throwing it across the room or, as you said, people kinda throw it, so ball-shaped, uh you know, if it were ball-shaped maybe, then it 'Kay. Um so we want it to be modern, fun, sturdy, um So our form and our function. Um we want it to be um easy to find. Um What else it what else do we want it to to do? So we want it to be universal. It's something that we're supposed to sell for about twenty five Euros um and you know, goals for profits are I think somewhere around uh fifty million Euros, what they wanna make on it, so. 'Kay. So marketing, you know, how maybe uh marketing, you could s find out

what is the most universally um appealing remote control out there. 'Kay. Um Do you guys have any ideas for what it should look like? Maybe we could draw it up on the on the board over there. Some ideas? We want it to be a b a ball, you know, we'll draw up we'll draw up the ball and maybe th um where the buttons are located. Uh-huh. How would we go about um making you know getting rid of our weak points? What I mean would we just have a flat spot on the bottom of the ball? Not to put you on the spot, but What did you say your title was again? You're the the Industrial Designer. Okay. Yeah. It's not new, it's not innovative, it's you know, everybody does long remote because it's easy, it's it's stable um. So if no, go ahead. Something with a grip. Yeah. Because even I suppose even with the ball it's it might not be the easiest to hold onto um. So perhaps the the joystick the the keyboard idea might work better. But then again, people like to use one hand to flip and one hand to hold their soda, so maybe maybe we I feel like I'm just shooting everything down here. Uh um Yeah. Okay, so unfortunately we've got about five minutes here to come up with our um remote control idea and start rolling with it. Um we've talked about our experiences with remote control and um we've got a couple ideas um. Let's see here. What if we had what if we had not only um say we went with the ball the ball function um, but maybe we give it sort of grips along the side s um to make it easier to hold on to. So you know um s so it's easier to hold onto that way. Course that'll then remove some of our our ball. Unless this unless this part were raised, so say the cover flips over and

covers that part. So the grip is No, that wouldn't work either um. But if we're gonna make it flat on the bottom, then that eliminates our ball anyways. So if it were flat on the bottom and then had the sorta grips on the side here I guess, um and then flat uh And then we have the problem with the hinge. So if we're flat on the bottom, it's not gonna roll away, it'll stay where we want. Mm, that's true. So we don't have it flip open. We just have a ball Okay, so then we forget the ball. It looks cool, but it's really not it's not functional um. So we've got our sort of keyboard kind. What if we flipped it around here, so that it were um Sorry, that doesn't look anything like what you had there. Um so it's up and down, you hold it this way. Course then it's it's like the rectangular again, only with a couple of jutting out points. But it's one-handed um. Yeah. Yeah. Yeah, because it doesn't have a cord, like joysticks do. Is it possible to have it to where it would work with a like a sensor on either side? So that either way you're pointing it it would work. More expensive and yeah. 'Kay. Um True. 'Kay. Are we out of time? Okay, well, just to finish up, should we s go with this plan, start making some Are good ideas, what are not. Uh. Must finish now, so. And then marketing will look and see what uh what people want. Okay. And Project Manager will design a better meeting for next time around, be a little bit more prepared. And uh alright, good meeting. Uh, uh, um. Okay. I am Corinne Whiting and I will be the Marketing Expert and in each of the three phases I will have a different role. In the function design phase I will be talking about user requirement specification, and this means what needs and desires are to be fulfilled, and I'll be doing research to figure this out. In the conceptual design phase I will be dealing with trend watching and I'll be doing marketing research on the web. And then finally in the um detailed design phase I will be doing product evaluation and so I will be collecting the requirements and ranking all the requirements to see how we did. Mm. Huh. Ours too. Mm. Ch Like a tracking device? Mm. Be good. Lot more modern. Maybe like user-friendly, like a little you know, where you can use both hands, like a little keyboard type thing. Mm. Mm. Mm. Also since we're partners of the International Remote Control Association, maybe we wanna make it something that would globally appeal. That's more on the research end, but the marketing. Yeah. And maybe as far as design goes, maybe we could have different ones for different target audiences, 'cause maybe one won't apply to all of the countries we're targeting. Futuristic. Mm-hmm. 'Kay, I'll draw something. What? My idea was just to have it be kind of like a keyboard type

shape, you know, like video games I so. But maybe I mean that would be kinda big and bulky. We could also try to do the hinge thing, so it could like flip out that way. I don't know. That's my idea. Yeah. Mm. Yeah. True. Mm. That's fine. You're the boss, you're allowed to. Yeah. Looks cool though. Yeah. Mm. Right. Yeah. Sorry to interrupt, but we have a warning to finish. Yeah. Mm. Great. Hiya, I'm Ryan. Um I'm the User Interface Designer. Um likewise I've three different roles for each stage of design. Um the functional design is looking at the tex technical functions of a remote control. Um in the concept design, the user interface, how the user reacts with the the product. And the detailed design um sort of like the user interface design, what they might be looking for, uh things like fashions, what makes wha how we're gonna make it special. That's about it. Yeah. Yeah. Well uh s function of remote control is just just you know, change channels is its main function. Oh right. I suppose you c try make it a universal remote for could work on all sort of electrical products in in one person's house. But, you know, they all sorta have the same role changing channels, volumes and then programming

. I think they all work on the same prin principle as well sorta like I don't actually know. But is it just infra-red? Is that standard? Ye yeah. Um one thing I thought of with the remote control is you always lose 'em. So if there's a g a way of finding it quite easily, I thought that'd be quite good quite a good feature. Oh you can get those key well you could whistle or make a noise and it'd beep. Yeah. Generally, all remotes are sort of quite similar in their appearance. Just long. Yeah. Black usually. Yeah. I think so. Maybe sorta spherical or something. A ball. Yeah. People I thought maybe, because people always tend to throw a remote control about the place to one another if it was in a ball, and maybe the actual controls are inside or something. Yeah. Yeah. Yeah. It could be cased on the outside and t everything could be inside. Ye Small. I'd I could draw sorta the ball idea. My original idea was just simply sort of a sphere, where maybe you this is where it's connected together, and then when you open it out, it could fol it could be maybe flip, like a flip phone, and then when you fold it out the middle Maybe a hinge that'll have to be the strongest part of it. If that if we did use a hinge, or if it was just two parts, and then you'd have just sorta you you you know, your buttons. Thing is inside I think, sometimes remotes have too many buttons, so maybe as simple as possible, um as few buttons inside as possible. Um, I dunno, what's the idea for. Just something maybe if you ha if it had like if some kind of like light or something or lights around it. It's looking a bit like something out of Star Wars at the moment though, to be fair. But yeah. That was that was a sorta simple idea I had and then you know you could about Right, it would almost be like a ball. So that was just just an idea I had. I don't know whether anybody else has other ideas? Yeah. Yeah. Maybe f yeah. Yeah, that's g that's a good idea. Yeah. The idea it didn't have to necessarily be f a hinge, that was just one idea though. Yeah. Well I I suppose that things become design. But I mean i I was trying to think of like the design of others. I can't think of anything other than a long rectangle for remote, maybe small, sort of fatter ones, but there's nothing being done sort of out of left field, yeah. Yeah. Yeah. I think definitely doing something different is a good idea. I mean maybe design something, that's sort of like uh I suppose not everybody's everybody's hand's the same, but something that would maybe fit in the hand easier. Yeah, with a grip. It still might be hard to it still not the ho easiest thing to hold, yeah. Like yeah. Yeah. It's d yeah. I think it's definitely got to be a a one-handed a one-handed job. Yeah. But then maybe to go back to the to th s something along those things then. Yeah. Put it Even if you designed it in some in a way that you know, isn't a rectangle, but still pointed in a direction that had definite points. So if that's your thing and you got something like that instead, and there's your s you kn you know which way you're gonna pointing it. Um Does it say what does it say for n it says on there what we need to do for the next meeting, I think. T

---

# Meeting ID: 119

Data Source: Train

## Executive Summary

The project manager opened the meeting and then the industrial designer discussed the interior workings of a remote along with his personal preferences for the appearance of a remote. The user interface designer discussed the technical functions of a remote and indicated that a user centered approach to designing the interface would be preferable. The marketing expert discussed the functional requirements of a remote and user tendencies in using remotes. The marketing expert indicated that an ideal remote would include an LCD screen, would not be too small in size, and is easy to use. The project manager briefed the team on some new requirements and led them in a discussion in which the team discussed their target group and made decisions on the appearance and functions of their upcoming product.

## Complete Meeting Transcript

One question. Send. Submit. Mm. Yeah. I'll go first. Okay. I'll go first yeah. So. Huh? Okay, um Okay, um I wanted to explain the working design of the remote control. It's possibly very handy if you want to uh design one of those. Um well so it basically works uh as I uh uh r wrote down uh in this uh little uh summary. Uh when you press a button, uh that's when you do pr for example when you uh want to turn up the volume, um a little connection is made uh the the rubber uh button just presses on a on a little print plate uh which uh makes uh uh a connection that uh gives the chips, uh which is uh mounted beneath those uh that plastic of a rubber button. Uh senses that a connection has been made, and know and knows what button you pressed, becau uh for example the the volume up or volume down button. Um uh the the chip uh makes a Morse code uh like uh signal which uh then is si uh signalled to uh several transistors which makes uh which sends the signal to a little let. You know what a let is? Okay. And that makes uh the the infra-red lights signal which is sent to the television set. Uh which has a sensor in it to uh sense uh the signal of the infra-red. That's basically uh how it works. Um the findings uh uh that I found uh searching up some uh detailed information about the remote controls, are that uh they are very easy to produce, uh it is pis uh it's possible to uh make them in mass production because it is as eas it is as easy as uh printing a page, uh just uh fibreglass plate um is b uh is uh covered with

uh some uh coatings and uh uh and chips. Uh and the technology's already available, we don't have to find out how remote controls uh have to work or uh how that how uh to make some chips that are possible to uh to transmit those uh signals. Uh I made a little uh uh animation of about how a tran our uh remote controller works. we tel There. Okay. Uh well the sub-component, I suppose that you understand what a sub-component is, is f in this example it's the button. Uh when it is pressed down, um, the switch is ter is uh is switched on, so with uh the wire is sent to the to the chip in uh co-operation with the battery of course, because to make uh a a signal possible you have to have some sort of uh li uh a d ad uh electronic uh Yes, uh, okay. Um w after it's being composed by the chip uh the signal uh is transported uh to the infra-red bulb, and from there it signals a Morse code-like signal to the to the b to the bulb in uh in the television set. Okay. S Uh I wrote down some personal preferences about uh the remote control. Of course it is very handy if the remote control is hand held, so you don't have to uh uh wind it up or something, or just is it's it's very light to uh to make uh to use it. Uh I personally uh pref prefer that uh it would be p uh come available in the various colours, and uh easy to use buttons. But I suppose that the one of the other team members uh uh thought of that uh too. And it is possible for several designs and um easy to use b uh sorry, easy to use buttons. Perhaps soft touch, uh touch screen uh buttons because uh the rubber buttons are always uh uh they uh slightly uh they can be slightly damaged, uh so the numbers on the buttons are not possible uh to read anymore. And uh well as I said uh before th uh we can uh make several designs. Okay, well, that's my contribution to this meeting, and uh two of these this meeting. So. Okay. Hmm. Mm. Mm. Uh L\_C\_D\_ screen as in uh touch screen? Okay. 'Kay. Okay. No. Yeah. Mm. Yeah for Standby options, yeah? Uh yeah. Two s two two digits, oh okay. Yeah I understand what you mean. Yeah. It makes it twelve, yeah. Indeed. Okay. Well, not really And and there are some models that don't uh accommodate that function. So d uh wh the Philip's television makes it possible in that indeed to uh press one and then two to make uh the uh tj to reach channel twelve. But uh all the television makes uh use of those button where you first press that button and then pr

ess two digits to uh to get Uh yeah, think so. Mm. Mm-hmm. Yeah, we we could yeah. But I think that uh that collides with our mission to make it very cheap. Because L\_C\_D\_ screens are very expensive. A touch screen uh probably uh even more. So, true, true. But uh Well um is it possible to make an L\_C\_D\_ screen uh, how was the information? So perhaps we should we should focus on that L\_C\_D\_ screen. Yeah but uh will we not uh exceed our uh our uh production uh Is it possible to find out, anyway? You know? No, an L\_C\_D\_ screen's just like uh like a drawn here. Um just uh displays several buttons, for example um if you wanted the minimal uh use b uh buttons, such as channel and volume, you just h uh displays four buttons on the screen and it's possible to p uh press them down, just like a touch screen. Yeah, we can make it possible to do that, yeah. Yeah yeah. Yeah, yeah. That's my uh Yeah. Twelve fifty. Um. Well I suppose wi if the mar if our um if the i if the young people are interested in L\_C\_D\_ screens, we should make 'em. And if that is our d uh market share to uh and our goal to uh deliver those uh remote controls Yeah. Yeah. Mm. It's treasure. I hope we uh h and let's hope to reach those uh those sales. Yeah, can you um uh s I think that that they will send you some information about uh the cost of L\_C\_D\_ uh screens. Uh so if you uh Yeah, so if you uh you receive an email about that, uh can you post it in the or shouldn't we post that in uh our projects mail uh folder. Because you are the the Marketing uh Expert. I uh Yeah sure, sure. Mm. It's looks fancy one yeah, of L\_C\_D\_ screen. Mm yeah. And then not yeah. Um. Yeah. Mm. Okay? Yeah. Yeah. And there's also a A sh but in a sub sub-menu or something like that. Uh I think it's also important to uh make it possible to um how do you call it in English, uh, to not use batteries, and use ac uh bat uh batteries to uh to be

yeah yeah sure. Indeed. So uh you can mount uh the the the uh uh the remote control to um to refill the Yeah. Okay, because i uh when you get an L\_C\_D\_ screen, you run it on batteries, the batteries will be uh empty very soon, very fast. Yeah. Yeah, yeah. Yeah. Uh And go to standby mode when you don't use it, so that Yeah, automatically. After two minutes or three minutes, something like that. Yeah. Sure. Yeah. Mm. Yeah. No, when you when you're done with s uh w uh watching your television, you have to put it Yeah sure, of course. Yeah, but But you also forget to buy batteries, and then you can you can't use it, so I Yeah. High power user cell, i uh it should be uh a standard move to to put your remote control in the charger when you're done watching television, that's also a a a great advantage because you can't lose it anymore. Because you are obliged to uh put it in the charger and not to uh leave it in a couch uh between some cushions. Okay. Yeah it hasn't It doesn't have to be big. Yeah just just a cable, or a even a a a a charger where you can mount it on. Something like that, just u Okay. Functional designs uh for the elderly uh you could make it possible to enlarge the screen, so make it possible to not uh display uh a button at ten points uh, or Yeah but it is uh one of the functions you have to uh specify. Because we can look at uh uh perhaps uh forty buttons at a screen, but the elderly only look at two buttons. Okay. Speech recognition? Hello. Twelve Euro twelve Euro fifty. Well, spread it by a big market. Well let's leave out all the remote controls and just put a microphone on top of the television to Yeah Yeah. Turn volume up. Hey, that that's an idea. Okay, well that should it has to be remote control, not Yeah. Sure why not why not Yeah, mm. Yeah. Perhaps the options should be uh Why not? Why not? Let's hope uh to have some uh d We should do it. Yeah. Sure. Yeah. Certain systems already exist, I think. True, yeah. Yeah. This should be uh accommodated with some software, uh, uh. Yeah. Right. Swahili. Swahili. Yeah. Indeed. Yeah. So we want to

uh yeah it's international uh okay. Okay. Y it should be done. If it could be done, should be done. That's not so difficult at all, because I already use on several voice operated systems, and they are all possible to uh not all, but Yeah, sure, indeed. For speech recognition. Uh yeah. S Shortcuts. Uh. Mm. Sh Yeah, just just sub-menu. Yeah. Not directly uh available. Okay. Mm. Directly available. So does it confuse uh the user? Uh. I'll search um. If you want to use teletext, you can push the teletext button and then the options uh become available. No. Menu. Mm. There are a lot of options depending uh on what kind of television you got. 'Cause if you don't got a wide screen television you don't need the uh the screen settings uh for uh Yeah and if the television does not support such uh operations Yeah. Yeah. Colours I think the main colour of the remote control is uh the colour of the L\_C\_D\_ screen. I Because we don't want a lot a devi yeah a device self s g Okay, so use uh very uh lot of peo Adjust with phones, yes Okay. Twelve Euro fifty. Well, make it available in different colours, you mean? Sure. Red, white, blue, black. Grey. Yeah sea view, yes, Simpson's versions and Leave. Yeah. Mm. No. Uh not button Yeah sure, of course you need uh a settings button, uh or a settings option for the remote control. Just tap it. Yeah, it should be in standby mode, but A A A normal button on the remote control, or norm? Yeah, because uh when you touch the L\_C\_D\_ screen when it is in standby mode, it should pop on. Wh uh why would it be a a need to have a normal button? Mm. I think it looks a lot more fancy if you use uh if you don't have any buttons on the s on on remote control. Oh, okay Oh. Mm. Okay. Food. Yeah, think so. Yep yep yep yep. Mm-hmm. Yeah. Well, shall I go first with the users? I think well okay no problem. Ja precies, ja precies, ja precies E\_I\_E\_. Animation. Infrared light. To this meeting. Smoking. 'Kay. Check. Kijke 'Kay, so. We're going to j discuss the functional requirements of the remote, that m that means that functions user n want to have on the remote control, or just Yeah, and the users, actually. The methods I I prefer is we're going to look which section of the users we are going to focus a l on more. Are the younger people going to buy the remote control or the elderly people? And

then tho that section we're going to focus and adjust the remote more to that section than the whole user section. Okay. Some data. Younger people, from sixteen to thir forty five um years are more interested in fj features like L\_C\_D\_ screens, speech recognition e etcetera. And we possess about two third of the market from in that range of age. The elderly people, from forty five years to sixty five years are not that much interested in features, and we possess less than two third, that's two fifth, of the market share in that area. Goed so. 'Kay. Findings. Fifty percent of the users lose their remote often. So we don't have to make it very small, like uh like a mobile phone or something, but some somewhat bi bigger than small, so you don't lose it that much anymore. Seventy five percent of the users also find it ugly, and fif seventy five of the users zap a lot, so the buttons sh should be that small, or shouldn't be that complex because we have to search for the buttons, which one are you going to use. Next. Important issues about the remote. I think it would be better with a personal reference, but okay. Remote control has to have to have a low power usage, because s w seventy five percent of the users only zap one time an hour, so the power usage is also one one time an hour, or so, with a high power usage we would use a lot of but batteries. The volume button and the channel buttons are the two most important buttons on the remote control, so those they those have to h be find very easily. And have to be somewhat like bigger etcetera. It has also be have to find easily when the label is gone. My colleague also announced it

that labels should be scratched off or would be s uh senden okay. So uh if that's k uh if that's the problem, you also have to find it easily on the remote. Buttons. Like what all colleagues said, have to have to be minimalized. or should be covered, or in L\_C\_D\_ screen. L\_C\_D\_ screen is easy because we have the L\_C\_D\_ screen, we have the various options. Put one option and then you have the all the buttons of that options, so the other options would be gone. And you don't see the buttons. So L\_C\_D\_ screens should be easy, but an L\_C\_D\_ screen, the problem with the L\_sc L\_C\_D\_ screen is that elderly people fr from forty five to for sixty five years don't use the L\_C\_D\_ screen a lot. So we have to that keep that in mind that if you're going to implement L\_C\_D\_ screen, you don't have to make it that hard to learn or to use. Yeah, touch screen, yeah. The last but not least, younger people are more critical about the features. Because they use the remote control often more often, and are more technical than the ol older people. And the older people spend more money, and easily on a remote control. So we have to keep in mind to to focus not a lot not that much on the younger pep younger people, but also somewhat on the elderly people. And on my personal preferences, I don't have any mo more time to come with that, but like I said, L\_C\_D\_ screen is easily to use because you have you can implement a lot of buttons in one remote with not that much buttons. And it should be easy to use. Especially the volume buttons, the channel buttes buttons and the number buttons to zap through the channels. And that is it. Ja, Be television. Only the television. So yeah, then you can yeah. Requirements, no? Functions. Yeah, the basics then by a volume, channel, one till two zero numbers on it, oh teletext doesn't have to be? Um other functions. Yeah I had Yeah, yeah. I think it's I think it's easy to implement a button with a s s what which especially do that, because some T\_V\_s, if you press the t one and then the two, it be between five secs it make twelve, and that's that's not relaxed to user. Yeah. So that it easy and fast. Yeah. Our main targets' age are? were? Forty five plus, or? Forties, okay because because younger people as Uh younger people have now, sixteen till to twenty five age, are f eighty one percent interested in L\_C\_D\_ screen. From twenty six to thirty five have sixty six percent, and thirty six to forty five, fifty five percent, so I think to um Because on most recog remote controls um the print plate will be broken how much, two years. You have to press h very hard to go to the next channel. With the L\_C\_D\_ screen it's easier because you only have to wipe the screen to uh

for fingerprint, and then you can use it again. Yeah, okay. Yeah but a you don't know True. Yeah, it only says that this per cent percentage like L\_C\_D\_ screen. Because, yeah and it says that younger age between sixteen and forty five highly interesting features more critical. And if the only f Yeah, because our target is sixteen to forty five. Yeah you don't know how much it costs. Yeah, you don't know how much it costs, the L\_C\_D\_ screen. No, I don't have any costs here, I only have percentages. Yeah. Yeah, if you want to adjust, like for example, adjust the audio settings, you press audio on the touchscreen and you get the buttons for audio settings, so the other buttons are gone. I think it's the most easier thing, yeah. No. Yeah. Highly. Yeah, but Um, s forty six to forty five, thirty three percent, and sixty fifty six to sixty five twelve percent. But our our our what's it, project requirements are the new products should be reached for new markets, to customers that are younger than forty. No, that not now, but, so Yeah, but market share fro for for forty years and younger is higher than that of sixty five and younger. Yeah, i i if it Yeah, if it costs gets too much, too expensive, then yeah, we should be sticking to rubber buttons. N nothing, no costs

at all. Yeah, in I think that should yeah I think we all get the costs of everything. Yeah, okay, I'll I'll post it. Yeah. Okay, L\_C\_D\_, yeah. Then you have the seventy five percent of users find it r ugly. Yeah, and eighty percent of the users would spend more money with a when a remote would look fancy. Tha i l i it'll look fancy with L\_C\_D\_ screen. Yeah. Yeah, just a the plain remotes, not not specific L\_C\_D\_ remotes. So Mm-hmm. Yeah, of course. And then you have the other thing, that seventy five percent zap a lot, but that's not a f question with the L\_C\_D\_ screen. Only thing you have to do is wipe the screen off once each time, to get all the fingerprints off it. Um Mm-hmm. The most important things on a f on an on an uh remote control are channel selection, volume con selection, and power s power usage. And a teletext, but that is not of the question. Other things are Sorry? Yeah, it could be. Yeah. Yeah, teletext. And other other less important things are screen settings, audio settings, and channel settings, but Less important. Yeah, should be there, but not press Yeah, sub-menu, yeah. Yeah, in a breath it's Charted. Yeah, but we don't we don't have any costs now, so Yeah. Yeah e e power supply is one of the most important things. Yeah, I think it's it's not that easy because I don't think people will like it who who uh that you have to turn it on first and then use it, so I think it's better when th the T\_V\_ shuts down, the remote shuts down. Yeah. Yeah. After two minutes, yeah two three minutes, yeah. Yeah. And then b that uh before an hour when its get again gets empty. Then you have plenty of time to recharge it, of put it in a recharger. Charger. Yeah, if it's. Uh. Yeah, because when you're watching T\_V\_, you're zapping and you have to put it in a recharger, and I don't think it Yeah, okay, but then we have to be sure that the the the the batteries go hours, six hours, five, six hours, then. Yeah, then you have a problem. Or we have to be sure that the batteries last couple of days when they're recharged. So. Yeah because you have b but you have L\_C\_D\_ screen. High power usage. Yes. True. Yeah. Yeah. True. Yeah, you made a point there. Yeah, otherwise all your yeah. Just a small device. Plug it in, that's it. Yeah, like a like telephone charger or something. Yeah. Yeah. It has to be easy to use also, or things. Uh market share, speaker re speech recognition. I think. Also. Well I think that this should be standard. Large button large buttons. Yeah? Okay.. Yeah, it says also Yeah. Twelve. That's an also ninety one percent sixteen to twenty five, twenty six to thirty five years, seventy six percent, and thirty six to forty five, thirty five percent. But then I l l Yeah. Yeah. Ninety. Twenty five. channel. Yeah. Yeah, twelve. Yeah. Is this only would you would you pay more for speech recognition in a remote control. It's the only thing it says. I think an L\_C\_D\_ screen should be suf sufficient. Yeah, it says a lot, but No I think I think it's better to have L\_ L\_C\_D\_ screen, because in the area of tw thirty six to forty five, we have about thirty percent of the market share in in our hands, and fifty five of those people want

L\_C\_D\_ screen and thirty five want speech recognition. So I think it's better to keep it with L\_C\_D\_ screen. Yeah, if the costs allow it. Nee. If it should be done, if it could be done, I won't matter. Yeah. Yeah. Mm-hmm. True. Yeah. True. But that should also be with f should be also with L\_C\_D\_ screen. Because then I think in Chinese is different written, volume is different written than um Swahili or something. Ja, well possible. Yeah, yeah yeah yeah. 'Kay, what else? Yeah, we have to keep Yeah. I think it's difficult. Every language of dialects I think it's very differen difficult. Yeah. I think it can't be implemented, but maybe Yeah, 's an option, yes. Fifty Euro cents. Yeah. Mm, yes. No, but Curved? Um. I think we should we could that we could also implement a audio settings, screen

settings and channel settings, but as sub-menus. D Mainly if you turn the uh remote control on, you have to u you have to see from one till zero, channel and volume. And if you want to use teletext screen or audio, then you can press it. It should be available but not not Yeah. Yeah. Yeah. Yeah, but s Yeah. They'd have to be easy to use. The sign of it. Uh, no. What else can you do with a television? Uh play, pause, doesn't n need to be there. Yes, so this is your presentation. We could check the other remote controls with technical functions. Which ones were yours? Techni Ja ja ja ja ja. Technical functions. Yeah okay. Uh I think I go to have volume, mute but I Yeah. Very slow. Yeah, the zoom buttons. Yeah, b wide screen, high screen, different things you have, yeah different uh Yeah. Yeah it should be available, but then in separate screen settings or something. Yeah, screen settings, audio settings, teletext settings you have. Channel settings. So those four, and of course the main. Yeah. Yeah. Like tap screens or something or, I dunno. Something Yeah, if uh No, you don't yu a no you then you don't no ni don't then you don't use it. Mm-hmm. Yeah. So you leave it alone. Yeah. Or it could be possible to have a a standard version of the remote, an expanded version. Yeah. Colours. Yeah. Yeah, then defines itself. Because uh how many percent? Eighty percent? Would spend more money if it looks fancy. Yeah. Rasta colours. Yeah, see through version. Yeah. If you press a button, it turns green. Channel settings? Yeah. Mm. Yeah. Could be possible. Or like uh you have a menu button, you press Yeah, or otherwise you have a menu button, press menu then you have uh main uh menu search uh all the all the settings. Yeah, no problem. Yep. Um, I think b because we don't have a lot of buttons on the one screen, I think the buttons Yeah, but but or like you have you only have channel button or volume button. Those buttons you can you can Yeah. Yeah, th No, no normal buttons, yeah. Maybe only the on and o on and off button. But I don't think Mm, no. No no no, because we we discussed that you could charge it, otherwise is it jumps to stand-by mode automatically. Yeah, but a T\_V\_ of course, th that's the I think that's a best thing is that to implement that one in the menu with the volume and channel. No. Yeah, you tap. Touch screen, yeah then it's turn turn off, turn on. No, just the remote. A television don't have to be on, that one you can press on, yeah stand-by, then press on remote, press on and then T\_V\_ should be available. Or not. Separate. Yeah, but I think the re the remote control, if you press tap the screen, it always should jump to the screen which has the volume button, channel button, and of course of also the on and off button. Yeah. Mm-hmm. Yeah, if we can afford it. Yeah. Mm-hmm. Good morning, again. All set? Good. Okay. Let's see what we can find here. Okay. A very warm welcome again to everyone. Um here we are already at our uh functional design meeting. Um and this is what we are going to do. The opening, which we are doing now, um and the special note, I'm project manager but on the meetings I'm also the secretary, which means I will make uh minutes as I did of the previous meeting. And uh I also put these as fast as possible in the uh project folder, so you can see them and review what we have discussed. Um if I'm right, there are three presentations, I guess each one of you has prepared one? Good. And um we will also take a look at new project requirements, um if you haven't heard about them yet. And then of course we have to take a decision on the remote control

functions and we have some more time, forty minutes. But I think we will need it. Um well I don't know who wants to go first with his presentation. You can go first, okay. Is there an order? I haven't And one question, uh your name Denni, is it with a I\_E\_ E\_I\_E\_, okay. Thank you. Sorry. Yeah, it's a little bug it's in the in the smart board. Okay, thank you.

Yep. Please. Okay, thank you. Okay, thank you. Um, well thank you all, huh. I dunno uh did everyone receive an email with uh the new project requirements? No? Well, then I think it's a good thing that I made a separate slide of them so you can all read them. Oh, well not in this presentation. Hmm. Should be in there. Well, I can tell you them uh from my laptop. Um teletext does has become outdated since the popularity of the internet. So that's uh the first thing we I think we should pay less attention to uh teletext. Uh the remote control should only be used for the television, otherwise the project becomes more complex, which endangers the time to market, and of course would make it more costly, I think. Um our current customers are within the age group of forty plus, and new product should reach a new market with customers that are younger than forty, and you talked about that before. And uh a last point, but also very important, our corporate image should stay recognisable in our products, which means that our uh corporate colour and slogan must be implemented in the new design. So we have to keep that in mind. Um well uh according to our agenda it's then time to take a decision on the remote control functions. So, who has any idea about what should be on it, and what shouldn't? Yeah. Only be used for television. Well it says only for television here, huh. Makes it a lot easier, huh? Mm-hmm. Uh well new product should reach a market with customers that are younger than forty, and now we have current customers uh of forty plus. Mm-hmm. So we're going for an L\_C\_D\_ screen? And hoping that when we produce a lot it won't be too expensive. Mm-hmm. Okay, so L\_C\_D\_ it is? Okay. And what else? Yeah, okay. But for now it's L\_C\_D\_. Okay. Yeah. Yeah, and maybe you can make something fancy out of an L\_C\_D\_ remote, because it's new, as far as I know. Okay, what else does our remote need? Mute button. Mm-hmm. Yeah, and we could make an a separate menu on the L\_C\_D\_ uh screen for teletext. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. And maybe a low battery indicator? On the screen. So we are going for the for the recharger. Okay. Yeah, also. Okay, well I've Yeah, you have some more points. And you said something about speech recognition? Even bigger than for L\_C\_D\_. But when you look at the percentages Speech recognition scores even higher, huh? Yeah, well, maybe because of the cost, but uh nobody knows uh how much uh it will cost uh. But would it be useful to imple implement both? On one remote? Or Yeah, I dunno. So, no speech recognition? Or Yeah, and then we have different languages. Okay, just make a separate remote for each uh Okay, so we only do this when we have enough money left. Okay. Well I've written down an an on or off button, volume selection, channel selection, uh the digits from one to zero, huh. Um or from zero to nine. Uh a digits button to switch uh between one and two digits, mute button, a separate menu for teletext, a battery indicator. Um we're going to use a docking station and uh probably L\_C\_D\_ and if there's enough money, speech recognition. And uh the possibility to uh enlarge buttons or to have large buttons in general. Okay, so not too much teletext support, but in a separate menu, and Okay, but no more buttons or functions, or? Aren't we forgetting something very important? Ping. Yeah. And a see-through uh Okay, well that's the signal for las final five minutes. Um so I have uh the things I just read. Um then we have uh separate menus for teletext, screen settings, audio settings, and what else? Channel settings. Okay. No, we said teletext also a separate menu. Okay, but we can work that out later, I guess. So we're having a a general menu with the most used functions, uh teletext, screen settings, audio settings, channel settings, and maybe there are options for the remote itself? Like uh large icons or small icons and I don't know what else, but Yeah, but on the L\_C\_D\_, huh? Right, yeah, okay. But

we don't need a sp

ecial we don't need a special options menu for the remote itself. Okay. Well maybe there should be a separate button apart from the L\_C\_D\_, because you can't turn it on when the L\_C\_D\_ is off. So how do you turn the thing on? There has to be a on button on the remote, huh? Tap the thing. Okay. And then the television is on also, or just the remote? Sure. Okay, well Yeah. So actually we're going to create a a button-less uh remote. No buttons at all. Okay, well that's might be a unique selling point, huh for a remote. Okay, well I guess we have to postpone further discussion to uh our next meeting, because we're running out of time. Um for now, we're having a lunch break, and then there will be uh half an hour for the uh next share of individual work. I will uh write uh minutes, if I can create them out of this. And uh put them in the the project documents uh folder. And here are the individual actions for the for the other roles. And of course specific instructions will be sent to you again by your uh personal coach. Luckily as we are. Okay, well thank you very much, for now, and uh have a nice lunch, huh? Yeah. Choose a number? Yes. Well. Well everybody already has his presentation, so you can adjust it. Yeah. Oh right. There is something turning. Yeah, I've got it there too. Yeah. Shall I go uh next? 'Kay. So. Well uh, my name's, and I looked at uh technical functions design of the remote. Uh I did this by uh looking at examples of other remote controls, of how they uh they look, and information from the web that I found. Um well what I found was that uh th the actual use of the remote control is to send messages to television set, how you uh d what you described uh just early. And this can be all sorts of medsa messages, turn it on, turn it off, uh change the channel, adjust volume, that kind of thing. Uh play video, teletext, but also t uh play C\_D\_ if you use it your C\_D\_ player the remote control will that one. There are some uh examples of remote controls. You can see they are very different. The one has got all the functions that you could possibly need and an lot of uh buttons etcetera. And the other is uh more user friendly, little with big buttons. And uh not n all the the the the stuff you can do with it, but uh the the essential stuff is there. Um I guess you could better y you should look at a a user centred uh approach, because the customers have to use them and and if they don't think it's usable they won't uh buy it. A lot of buttons they may think from I don't need s as much as that. Uh, well perf personal preferences is is uh a simple remote, with uh the basic functions that you can need that you could use. But uh keep in mind the new functions of T\_V\_ what we discussed earlier, split screen and uh is that a function that you should have? Because all the T\_V\_s will have them. Or because of only a few and isn't really necessary. And then uh make it I would make so that you can could uh use it on more than one appliance. If you have one that uh uh does with the vi the the video, it could also work with uh with the stereo, because play is play and stop stop and that sort of thing. The shu c you could reuse the buttons so that you don't have to have a lot of buttons for uh anything. And it should be a user friendly, clear buttons, and not too much. And that is my presentation. You must still have it open. Yeah. Hmm. Mm. Oh right. No. Res I did not. Perhaps the rest? Oh. Mm. Well you said it should only uh work with one appliance? Or with one uh d che only the T\_V\_? And the video also, or not uh? Oh. Alright. Okay. Yeah. Then it should have uh on, off, and uh Yeah. And per perhaps uh No. Well uh uh yes yes s sh A button where you can uh change from one number to two numbers. Can you Don't know if that's got a name, but Yeah. S Yeah. Yeah. Yeah, so you should have that one on. Mute misschien also. An But, do you But if you would do an L\_C\_D\_ screen do we have don don't you have any buttons? Or because if it only d

irects at the T\_V\_, then you only have uh I don't know what you want to do with the L\_C\_D\_ screen. Yeah? Oh right, so you can Oh, yeah alright. So you can adjust which buttons you want on that s screen. Yeah alright, oh right. Yeah. Yeah. Would be yeah. Well we had twelve fifty, I guess, for uh

production? Yeah. I dunno how expensive an L\_C\_D\_ screen is. Any guesses? Yeah. But But he also said that we should not only focus on the younger people, but also on the older, and will they use it if it only has an L\_C\_D\_ screen? Oh, so still a little bit people Yeah that's right. But you don't want to alienate the other uh But if they also buy it then it's alright. I guess. Yeah. Alright. An Yes. Yeah. Yeah. But perhaps later, so uh Yeah. I don't Well perhaps we should have a backup plan that we would use buttons if it's uh too expensive. Yeah. The L\_C\_D\_? Oh that's a bit of a problem. Oh, that's a bit of a problem. Yeah, but they don't they don't like it. They think it's ugly. When it has an L\_C\_D\_ screen. Oh, alright, I thought that you said that. Yeah. Yeah. A mute button. I think. And Yeah. But But shouldn't you put a button of for teletext on the for the people who want to use it? Remembering we have got a big remote that you have to fill. Yeah. Yeah, they are less important, but I think they should be there, or not? Like with a with a mouse, you have not, yeah. We should think of the twelve fifty we have but I don't know how much that's going to uh Yeah. You should Perhaps you should be able to to switch the control off. If you have an L\_C\_D\_ screen that's burns all the time I dunno. You shouldn't on and off because that's ver extra, that you have t first you have to turn the remote on, and then you can uh I don't know. Nee that's that's uh yeah. But then you can't Yeah. Yeah yeah au automac matically, that it yeah. Yeah. If it's sensible. Yeah. Yeah, b when the batteries are low But you'll also forget to put it in, because you throw it on the couch and you don't remember. Yeah. That's right. Yeah. Well I think the batteries should should w should work a lot longer than a couple of days, or not? 'Cause Yeah, that's right, but Yeah. Right. But then you also have to s have somewhere where you can put a remo recharger near your couch because otherwise you have to walk a long way when you twoft want to turn on the T\_V\_. Yeah. I think everything has it for and I guess. Yeah. Alright. Yeah, twelve fifty, twelve fifty. So it's pretty big. Yeah. W I know let's do a speech. Yeah. Yeah. You can clap or something. Yeah. Now you shouldn't say the wrong thing, I dunno. But they want to talk into the remo remote control, or something, or? Oh, but do we want to implement that, or? Yeah. I know Mm. Well I don't know if that can be done with the cost of twelve fifty. With that uh Yeah, but how would you like to implement that, that you say volume up, and then it goes up, or? Uh. Then you also have to have different languages if we go international. Then uh it's y it's yours to do a French and Dutch and English and Yeah, that's right. Yeah. Yeah you can use icons for the a speaker and uh But if that's better than language for the for the remote. Then it's Yeah. Well, if it could be done, we Yeah. Yeah, that should be uh anything matters. Well, you sh you should to adjust the thing. Yeah. And you have to speak the so that it can understand. You could use that n as an option, if you have money left, or something. Yeah. Let's do speech. Yeah. Mm. Yeah. I With uh teletext if it wasn't ver very important, it was but You also now have colours. I don't know if we should implement that. Yeah, when you press the red button, you go to page one hundred two, and when you press the I don't know if we should implement that, because it says that teletext not really important, but yeah, the shortcut, and you can't go to sport. Yeah. 'Cause it should be there. So actually it is there but it's just not r ready there. You'll have to search for it. Yeah. Yeah, that'

s a I guess not. We've got anon Have got got two examples here, but I don't think there's anything we're missing. Well, we don't have the video orders Yeah, you could look here all the the Uh th th th th I don't know, technical functions. They're a bit small, you can we should stretch them, because I guess we've got them all. And for a T\_V\_? Can you zoom in a T\_V\_? Or that you can put 'em on uh on on wide and yeah. But that should also be a sub then, a sub uh menu thing. Yeah, so we should also implement se screen settings. Oh right. Yeah. Yeah, so you can program the Yeah, so the first you see the main, and the other ones you can uh go to uh Yeah. I hope we can do this. We don't have to use that top. Yeah.

Yeah. And do we want them in different colours, or And and the buttons, should they have colours? Oh but we don't have any buttons. Yeah. They think it's ugly, right? Perhaps you can uh make adjustable fronts, like with the telephones. You can uh But I don't think that uh Yeah. Yeah. Yeah. A disco version. Five minutes? Oh yeah, right. So you can program the T\_V\_. Perhaps you should you'd throw them on on in one pile. So, options, and then you sub them. Otherwise you have all those teletext, perhaps teletext not, but Yeah, but I Yeah. Yeah. But I don't know. Or do we have any buttons? On the remote. Which one? But that's also in the L\_C\_D\_, right? So we don't have any normal buttons that uh No, alright. Yet on and off is p is perhaps you know No, no. Oh well, you should be able to set which T\_V\_ you have. If you have if you have uh Yeah. But isn't idea to use uh uh what you said, uh normal on and off button for the T\_V\_, that you don't have to use a Yeah but but not for the remote but for the T\_V\_, that you use But a not as normal button, in the L\_C\_D\_, yeah. No you just tap I think. But Yeah a yeah. I don't know whether it's handy to have a n a normal on button, a r just uh rubber uh for for T\_V\_, so you can turn it on and then you can choose the channel. Otherwise you I don't know whether or not that's Yeah, yeah. To turn it on. Of or you should put it in the L\_C\_D\_ screen. Yeah, I have, yeah. Well I I guess if you use the L\_C\_D\_ screen, you first have to search where is the on button, then you uh you you then turn it, and then the T\_V\_ goes on. But if you have a normal on button on the on the remote, then you do the on, and then you search the channel which you want. Oh right. Yeah, I think so too. Otherwise y wet e k Yeah. Yeah. If we can afford it. Alright. Lunch. Should we put this back in our rooms, or uh? Yeah.

---

# Meeting ID: 22

Data Source: Train

## Executive Summary

The project manager opens the meeting stating that they will address the functional design of the remote and saying they are still undecided about whether it should be universal or specific. He suggests they name the project and they come up with "mando", meaning "control" in Spanish. The marketing expert presents some research done on user opinions of remotes. He suggests the use of using voice recognition or an LCD, which they discuss despite concerns about budget limitation. The industrial designer presents, showing examples of existing products and suggesting they add a scroll wheel for channel-changing. He says Internet capability might be necessary for an LCD and then brings up button size, suggesting having a flip-open door with extra buttons under it. They discuss voice recognition again, and then the interface specialist presents. He suggests they have two types of user interfaces and brings up that voice recognition would increase production price. They talk about the budget limitations on features and then the project manager summarizes decisions made and closes the meeting by telling each group member what he should work on.

## Complete Meeting Transcript

Uh. Mm I was thinking of the Mando. Mando. A\_N\_ yeah D\_O. It doesn't it doesn't sound cool for me, but maybe for a Spanish for I for Control. But mm, yeah. Mando sounds Latino. But yeah it uh Yeah because if the product will be international Maybe maybe I should uh start. Yeah. Mm. Okay. Yeah. Should be in participant four. Yeah, yeah. Uh. Okay so yeah I will I will give a brief outline about what I what I prepared for this meeting. For the functional requirements and especially for the for the user requirements. I prepare a marketing report and we have to find the weaknesses and and the the improvements we could do to the current remote controls. And also I di I did a study with for the incorporation of new technologies it seems that the remote controls have been have remained the same for the last five, ten years. There is no no significant difference between the the b the first new controls and Yeah. Yeah. Well more most of the people think that remote controls are ugly, thoroughly. So and they they admit that the the they should uh s they would uh spend more money in a fancier remote control, which is which is good and it's interesting point. Also the people are worried about

about the R\_S\_I\_ disease, which is if you repeat the same movement, which is not a very appropriate device, you will have problems when you will get old. So some people are worried about the shape of the remote control. They are also they get angry very often because they lost the remote control very often, so I think it would be a good point to find a solution to any beep any alarm or something incorporated to with the remote control every time it get lost. And also I found that young people the younger people are the more interested they are in incorporating new technologies in the remote control. So in my opinion the Mando this Mando shouldn't be very small because the smaller it is, the more like the likelier it is to get lost. Likelier or more likely? likely. Okay. Uh people also complain because they they all have the same size of the buttons for buttons who which are not very use like frequency memorising channels or or this kind of actions which are not very often but they they shouldn't they shouldn't have the same importance in the remote control. Also the design should fit the hand shape. So it may be interesting to think in both prototypes, for right and left handed people. Yeah. I dunno I think Anyway I think it could be interesting to release some a small fraction of of this remote controls. Sorry? Yeah. Yeah. Sorry? Yeah. Like uh Yeah, like No no I was thinking of so like something yeah. Yeah. Yeah yeah. It shouldn't be symmetric symmetrical. Not anymore. That's what yeah. And finally, the incorporation of a L\_C\_D\_ or a speech recognition system in the remote control could also be interesting, but I don't know if the budget would be large enough. But most of yeah most of the young people to thirty to thirty years old were really interested in this kind of technology. Actually this marketing report is restricted to T\_V\_ remote controls. Yeah but you should be able to activate or deactivate, so yeah yeah. Yeah uh channel fifty. Yeah. H I think I think that the transition to this to this new remote control shouldn't be very very abrupt very hard because if people see a remote control without numbers mm they will think it's very difficult to learn very difficult to very different build very different to the traditional If y I'm sure if you can sell a speech recognition remote control for twenty five Euros everyone will buy it. I'm sure. Yeah but you know the average frequency of pushing buttons, it's about eighty eighty eighty pushes per hour, or something like that. With a good shape for the Yeah. Uh What would be What would be

one question, what would be the goal of putting an L\_C\_D\_ in a remote control? What kind of information? Yeah but most of the T\_V\_s nowadays show the the n Yeah but yeah most of the T\_V\_s have teletext nowadays. Yeah. So what would what would appear in the L\_C\_D\_? Okay. But Yeah. I think that the speech recognition technology would be cheaper than the L\_C\_D\_. Because with the L\_C\_D\_ you need more requirements. You need an internet connection. You need more things. But for the speech recognition you don't need anything. You just say channel fifty, and that's it. But then we should move to another target because at twenty five Dollars, it's To move to another target? the expert uh said ninety five percent. Okay everybody is ready? Good morning again. So, today we are going to have a second meeting. Oh Michael, hi. You're late. You have a good reason for that? Very good. Okay, let's have a look to the agenda today. So, we are going to have a meeting about the functional design. Um so first before starting I was just going to uh to go quickly to through the minutes of previous meeting. So uh basically we are not decided if we should go for a universal or specific uh remote control, but I have new inputs for about that topics. I goin I'm going to share with you. And uh basically we decided to go to individual actions for each of you uh so um Industrial Designer should work was supposed to work on the working design. You showed us you are you prepare something for us? The U\_I\_ guy also uh work on that, yeah, and for the marketing our Marketing Expert should deliver some specs. Alright so so we are going to go

through three of your individual presentations. But first I would like quickly to uh to decide of to give a name to the project. So, I just put d quickly Remo, but if you have any o other names that we co could decide for just to to keep something fun for our project we we should we could discuss quickly. Any ideas? Powerstick, yeah. What else? What else? Mango? Mango? Mando. M\_A\_? M\_A\_? M\_ D\_O\_. Mm, okay. What does it mean? Oh. Hmm. Nice. Okay. So, let's go for Mando? Yeah? No objection? Great. So Okay, I think this is Okay. Okay, I think this is more a question of of I I think this is more a question of of look and feel. Something that should be addressed later. We should we should go to other for the other topics. Yeah okay, so let's stick f to Man Mando for the name and we'll see for the for the look and feel later. So let's go for the three presentations right now. So, who want to start? So maybe we could start with the market, yeah. Okay so I have your slides somewhere? Participant four. This one? S that's coming. Uh okay. Great. Mm-hmm. Okay. Sh next slide? Okay. Mm-hmm. Okay. Yeah. Something with the shape of the palm? On the sides. And then finally Yeah. First I'm just wondering about the L\_C\_D\_ stuff because uh because Yeah, so maybe it's a good time for me to uh to bring you to some new uh new informations. We had the new requirements from the so uh from the head offices of the company, and so they wanted so they want to um they would like to be restricted to T\_V\_. Okay, I dunno if you had this information already. No, so they want us to restrict the remote control to T\_V\_ only because of time limitations. Um they want also uh Excellent. So we have also to focus more on the internet aspects because well well teletext is outdated now and uh finally, it should be clear that the corporate image, that means colours and logos of the co our company should be clearly inde identified in the product. So Yeah yeah. Sure sure. So maybe we can jump to your presentations, right now. Okay so let's keep in mind about tha that that this last point about L\_C\_D\_ and speech uh reco Sorry, what is your? Okay Michael. Sorry? Um yeah. The wheel doesn't work. Looks like a P\_D\_A\_? Mm-hmm. Mm-hmm. Okay, can you continue, please Mi? Mm-hmm. Okay. Okay. Okay, thanks. you w

ant to go? This one? Great. No, not that one. you are two. Alright. Okay, sorry to interrupt you, but we have seen before that there is a new way of interacting that use wheel. Okay. Mm-hmm. Yeah. That increases the the cost also. Do you think that performance of such systems are enough to to target well of such technologies is enough? Okay. Well wh uh I imagine also that the microphone will be an ambiance um a um an ambiance microphones because you are not going to speak into into th into the remote control. So it could be s a few centimetres. Yeah. Okay. Okay we shou we should discuss this la later after after after this this uh slide. This is a this is a this is a a very important uh issue in discussion. Okay, next. Uh that finished? No? Components? Yes sure. Okay. Okay. So your your opinion is that we should go for special condition technologies? Yeah. Okay so Okay gentlemens, we have to take some deci decisions right now. Um so if I if I kind of summarise everything we've de we we said. We are targeting T\_V\_. We need we need to have um um remote control which is fanc fancy, which is uh which is easy to to hand not too small, not too big. Um we have or good shape, yes. We should bring new technologies for young peoples, and uh as we have uh also requirements to to use uh to to push thr toward the internet. Maybe this is something we can stick to it. And um also, a very interesting things I I I've seen on on on the one of the comp o our competitor is this wheel that we can use to navigate. So so my feeling is that re regarding costs budget we have an an an target price, it's not possible to go s to go to L\_C\_D\_ and also to go to automatic speech recognition technologies. Uh first m m why not to go to L\_C\_D\_. Because um in fact as we are targeting uh T\_V\_ in fact we can use T\_V\_ screen as a screen to feedback to to give some feedback informations about what we could have. Yeah that's right. Don don't you ha don't we have contacts with uh people on T\_V\_ or or well systems that exist that we

can use? Yeah. Yeah. That's good point. What's what could be the cost of uh well, could we fit the the targets uh in terms of cost uh if we go s to L\_C\_D\_ on the remote control? Yeah. So you mean yo you mean we we should target something maybe which is which would be more expensive but re really fancy in terms to um in terms to had to have really an added value? Okay, so regarding the automatic speech recognition, I think this is They have tele teletext. Well, because they have teletext on it. Th th you have a teletext sin signal that you can that you can uh that you can get thr through the channel. They have t most of them have teletext, but we want to get rid well one of our requirements is to uh to move to teletext to uh to the use of internet. So to to uh to browse more easily the teletext. For instance through uh through your remote control. The ti the start time, all the p all the programmes you could have uh o Well I don't know if this information is available from teletext, also. Well because for the same reason that we cannot uh informations on the T\_V\_. We c we couldn't grab information information which is not there. So so that mean w w we need an in an extra internet connection to use the remote control, if you want to browse, in addition to the T\_V\_, or uh or it should be a special T\_V\_ connected to Okay. We need to close the meeting. Um so Very quickly. No. Yeah, well people go to buy another remote control when they broke n broke their, and they want to go t for universal one, and they take the fanciest they can have. So this is that we z that that we should target. So the com the um the uh the committment is the following, we don't go for speech recognition technology. The L\_C\_D\_ is still on disc is still open to discussion. It is up to you to go through this um uh this way and to to report report me back next meeting. So Yeah, but not sure. Maybe it's cheaper, but we have no Okay this is this is an open question f

or you. Yeah. This is uh up to you to tell us. But I'm definitely not keen on to to no no no, I'm no I'm definit definitely not keen on going to speech recognition technologies. I'm not confident enough. I'm not sure that that we'll have a product really that work. I uh that work It's real yeah. How to guarantee such performances is really hard. Well this is still is is very bad. So, this is the end of this discussion. Next meeting uh here are the task you have to work on. Um so you have to work on the component uh concept. Uh you have to work on user interface, and you have to go through a trend watching. Okay. So the question is still open about the L\_C\_D\_ thing. Um uh we I hope that next meeting we will uh we'll take some um decision that direction. Thanks. Bye. Yep. Yes. Mm. Uh the Powerstick. Maybe a Spanish name would work well. Especially if we're selling into the U\_S\_ market becasue there's a lot of Spanish speakers there. Maybe something that sounds cool in English but sounds funny in Spanish. Mando. What is that? What does it mean in Spanish? Control. Okay. 'Cause it also like in English it sounds like you know the man's tool you know because you know men like to have control of the remote so it might The Mando. Yeah that's. And we could have some like you d you could have the fonts you know special, so you have man in like in in uh in one o in one font and then the O\_ as like Although you don't wanna cut uh cut women out of the uh potential buyers though, do you? So Yeah. Marketing. Well that's the thing. We need to know who we're selling it to before we can really decide on a Um. Yeah. More likely. Well th the on the thing is though, most remote controls are used by more than one person. So unless you're kind of targeting single people you know you're gonna maybe cut out some a lot of your market. Still shaped for yeah for your hand but not for a particular hand, right? Well it can still be a, you can still extend past the hand. Uh. Well it means like, this remote here is kind of is very thin and long so instead of having you know you might have it kind of a bit bigger or, you know, with maybe some some finger molds or something. Some finger grips maybe. You could even have some buttons like you know on the sides and everything, but Yeah. Yeah. No. I was still uh I was still working on this uh twenty five Euro price point because I think actually having looked at some of the

remotes out there, this is quite a low uh price if if we're maybe I can get to this in my presentation though, but um yeah. Yep. Okay. Yeah. I think even even if it was within budget do a speech reco rec system it might be a bit difficult because if you think if you're watching T\_V\_ you're gonna have a lot of this uh background noise from the T\_V\_ which might interfere with the Uh participant three. You might have some background noise from the T\_V\_ which will make the speech recognition much uh harder, so. Oh you press a press a button to talk, and the the T\_V\_ the T\_V\_ sound turns off. Yeah. Yeah. Mm. Yeah. Okay, so, could I describe the mouse maybe be easier to could I use the mouse, or Mm. Thanks. Okay. Great. Okay so um while uh researching this this topic I first of all just thought of a couple of things that I would like to see in a remote, and just uh looked to see if they're actually available in any current remotes, and then also searched for which are the top-rated uh remote controls on Epinions dot com, which is a a you know a a customer um written basically review site. So um there's a pretty wide range of uh remote controls these days and and uh this remote control on the right here is is one of the more extravagant, but it's not really it's by no means uh mm you know on it's own in being so expensive. There are a lot of expensive remote controls out there. So yeah it doe it's well basically all the functions uh are controlled through through the L\_C\_D\_ screen except for the really really kind of main functions, which have a coupl

e of of their own buttons. Um and if you look at a lot of the universal remotes out um on the market, I know we're working on television remote, but a lot of the universal remotes out there have uh have these L\_C\_D\_ screens which kind of helps when you're using multiple uh devices I suppose because you can have multiple kind of functions d different functions on the screen at different times. But um the thing that I find most interesting about this remote control, and it's kind of difficult to uh to see in the slide, but it has a scroll wheel on it, which is kind of like uh a mouse scroll wheel, which I think is it's a really kind of important design aspect um is it's 'Cause the thing is what a what we the presen this presentation we had is what we want the remote control to actually do. And obviously the the simplest thing that a remote control does is it just change the change the channel. Now um uh the I think that a scroll wheel is actually pretty a pretty handy way of of changing the channel. 'Cause I know when I um when I use the remote to change the channel I very rarely use the numbers on the on the pad. I usually use the up and down because most channels are you know two digit numbers and you have to press you know a special button to enter a two-digit number, and then two numbers, so that's just uh it's annoying. So I think a scroll wheel is is quite handy. Now um the the scroll wheel is is much more useful if you have an L\_C\_D\_ screen, and this brings us to the the point you were mentioning before about the internet uh capability. One possibility, if we now we need to still talk about the price point because obviously a lot of this stuff can't be done for twenty five Eu uh Euro, but one possibility is to download program information into the L\_C\_D\_ screen so that instead of actually saying I want to I want to go to channel thirty seven because I know this programme's on, you know, often you don't know what ch what channel it's on, or you don't know what's on. If you have a list of of programs on your L\_C\_D\_ screen you just scroll to that program rather than to a channel. So if you think about it's kind of like a you know in mobile phones now you don't use you don't remember people's phone number, you remember their name and you go find that name and ring it. So this would be pretty kind of a handy thing to have, but um we we really need t to discuss the price. So, I mean there are there are uh cheaper this is another multi kinda purpose remote control where it's it's it's very simple, there's only a few buttons, but al each of those buttons does something different in a different context. So this is something else we might wanna consider, is really kind of limiting the number of buttons, because this is the top rating uh universal remote control on on Epinions. It it's really uh maybe worth thinking about

limiting the number of buttons as much as as possible um because really I think people want to be able to find the button they're looking for without even looking at the remote control. And was saying before about having different size buttons for different you know frequently used uh tasks, but I think also you know the location and and shape of the buttons is important, but also the number of buttons. So if you have too many buttons it it increases the the difficulty of finding the one you want. So Yeah well we w Yeah well we will have a bit of a simpler uh task in that we're only doing uh a television remote control. Um I think maybe one option is to have you know a little flip-open um door that uh that you have hidden most of the time, but contains the extra buttons like, say, the number buttons for instance. Um I I would if I had my perfect remote control, I'd probably just have no numbers at all on it because they're just in the way. They don't really do anything. Maybe you know I although I do also find flip-open doors a bit of a pain because sometimes they can break off or or whatever, but maybe a door t

hat you can you can permanently remove or permanently have on would be good. Um but I think definitely you need to to keep the buttons down to a minimum, but not not let that kind of interfere with the functionality of of the device. Um Well I guess that depends on how you market it. If you if you have the right advertisement showing how how how easy it is and how you can, you know, navigate to a program without the numbers, then people might say that looks pretty easy. So, but yep. Um okay, so, I think um one of the really kind of useful things you can do with with internet connectivity would be to have this a programme driven interface rather than the channel number. So if we can have a higher priced uh remote control I think that would really be worth uh something that would be worth implementing. Um mm there's the L\_C\_D\_ screen, um which maybe maybe is too expensive, um but I think also at the scroll wheel, I haven't mentioned it here, the scroll wheel could be used without an L\_C\_D\_ screen, just for changing channel numbers easily. I think even that, I mean, that would be a fairly cheap thing, compared to an L\_C\_D\_ screen, to implement, um but I think that would be quite useful as well. And the other thing, you say we need to we need to keep it just television, but I think one maybe one option, since this is supposed to be a kind of a fashionable device, is you know there's a certain kind of cool or wow factor that you can kind of you can have with technology, and maybe we wanna make it something that's extensible to do other tasks. Say you have like um a little another little kind of base unit that can also receive signals as well as the television where you can, say uh, change the lighting in the room. You know that would be something maybe you could sell as an extra, so that it doesn't have to be part of the initial development, but, you know, later on you could you can you know you also, selling the potential of the device. Then you say potentially you can then do other cool stuff like change the lights, I dunno, close the windows, whatever, turn the heating on, and um, I think that's something we may need to have as as at least as an optional extra to to kinda make our product cool, since we say we're putting the fashion in electronics. Hmm. Well one one other thing that that speech recognition could really blow out the price for is uh when you want to sell into other markets, though, because, I'm not sure exactly where we're gonna sell this, but I presume it's not gonna just be English speaking countries. So then you have to s you know, you have to train models for Yeah. You know I guess you could actually train the remote control as you're using it by saying you know turn volume up, and you press the uh press the button like uh s people teach sign language to kids f well, by speaking and doing Yeah. Actually I'm not so sure because I'm the you know if I was using a remote control to, say, turn the volume up because I can't hear it very well, I don't really want to you know drown out what people are saying by talking you know when I'm when I'm instead of pressing up on on a remote control. You know if there's some there's some dialogue all of a sudden that I can't hear, I'm trying to actually find out what's being said, so maybe speech recognition gets in the way more than it helps.

Well it depends if it's a remote control th Maybe if the remote control is something that y you don't actually have to pick up anymore, that would be a a useful feature of the speech recognition. If you can leave it sitting on the table and you don't actually have to find it, then that could be. Well it depends though well it depends. If we we don't unless we have some input some video input to the T\_V\_ or we have control over the T\_V\_ then we can't actually display that. Like if we if we produce the T\_V\_s then then yeah we can put you know menus up up there, but otherwise we need to actually have some kind of something sitting in between

the video signal and the and the T\_V\_ to superimpose those those menus. So that's an extra cost. Well this is this is another que we still haven't really defined the remote. Are we still you say we're focusing on T\_V\_, but is it still a kind of like a universal remote in that it's a replacement remote control, or is this something for our own line of of televisions? 'Cause that really makes a big difference. 'Cause even if we have contacts we can't really produce a remote control that can bring up menus on other other companies' T\_V\_s. It's just there are too many T\_V\_s out there. It's it's not really gonna For twenty five Euro? I think it's impossible. But but I dunno, I think um it would be good to know if there is any leverage in that any leeway in that um that twenty five Euro because for twenty five Euro I think all we can really do is provide a very basic remote control, and that seems to be kind of against the philosophy of our company which is you know putting the fashion into electronics. So I would I would like to know if there's any chance of of increasing the uh of increasing the unit price. Yeah. Yeah. Yeah because yeah. Well th 'Cause you can have things like the programme name instead of the channel numbers, like an interactive programme guide. You can get a lot more information on it. So you could have the name of the programme, you could have um the start time you know where it's up to. You could have a I even a little image of you know the c you know the the m the main actors or something so you can quickly just kind of even without reading Well no, but there are the electronic programme guides out there. They may not have pictures, but maybe they do. There's dependi it also depends on the country. No but I mean with the internet you have flexibility of where you get your information from. So it may be possible that there are people out there providing that. Uh. Well I I think if we're gonna I think we would definitely need the internet connection because even with y I don't think you could even get teletext information from the T\_V\_ onto the remote control, especially if we don't control the T\_V\_. I dunno. We need to find that out. Mm. If it's a really small T\_V\_ maybe. Well the thing is I think I think the type of peop I think the type of people that are gonna want to buy a very stylish rem r remote control with lots of new technologies are the kinda people that are gonna have you know a wireless internet connection maybe, or a you know. Well this is what we need to find out. Can we can we increase the the price point of this remote control? 'Cause otherwise we need It's kind of hard to guarantee that you're gonna Ninety five percent is not good enough though. Yep. Yep. Yeah. Yep. Mm-hmm. Yeah, yeah. Yeah they are the most T\_V\_ watcher. So we should be careful. Yep. Well maybe it could be a universal design. A universal design, which is which is good for both the hands. Yeah? That's right, whether it's left hand or right hand, but but don't you think that the two points are clashing, one thing you are saying design should fit the hand shape and it should not be very small? The first and the third point, they are clashing. Okay. So fitting the hand doesn't mean much then. Mm-hmm mm-hmm. Mm-hmm mm-hmm mm-hmm. So it means design should be similar to the traditional ones? Little sleek, longer? And it should fit the hand. Mm-hmm mm-hmm mm-hmm. Mm-hm mm-hmm mm-hmm. No it could be command control kind of thing. It requir recognises particular sequence and then it gets activated. Means you say you should say like does that, remote control being on or be on kind of thing, and then remote control comes in the picture for the speech recognition. Because this kind of thing means

speech is there from the T\_V\_ also. So there should be something command controlled, you start and then you stop. It's like V\_I\_ editor, you are having two modes similarly. Otherwise it's just lying idle. Change the channels. Yeah. Mmm-hmm mm-

hmm. Yeah yeah. But there is one problem then the user has to understand each of that functionality. Because the same button is doing too many things. Mm-hmm. Mm-hmm. Mm-hmm. It does sampling out of the. Yep. So yeah. So most of the things which we are discussing about is speech recognition uh, that means on my own I yeah, it should be. Two. Okay so the working design is uh user i interface could be of two types, one is the usual press buttons which are there so that the user feels that he is knowing doing some he is knowing about that technology. So he is pretty comfortable if he wants to get this, and on top of that there there could be a speech recognition technology also being sitting on the on the remote. So the old kind of users who don't want to have any changes, it can it can be useful for them, and the new users, as uh our Marketing Expert was saying, they can use the new gizmo which is speech recognition kind of thing. That's right. So anyway, that didn't come into my mind, so th that is a possibility. These could be other kind of interfaces. Means we can have, depending on the cost, how much we can afford, we can have different kind of interfaces. So spe buttons are something which is very everybody is familiar with. So if you go to the market and you say that buttons are there the people know what it is, and on top of that if we are having extra functionality people are willing to shell that twenty-five Euros money which we are thinking. Otherwise we are just like others in the market. So anyway that is the first, user interface could be of more than one type, and uh yeah that means we can do the on-line changes which which cannot be done now actually. So apart from the speech, we can have the scroll kind of thing with the buttons. Now for buttons, normal requirements like bit coding and all those things are required. And for voice, limited vocabulary automatic speech recognition system is required and we require a microphone also to be sitting there on the remote. Uh that's right. But uh means we have to see how much what kind of microphones and stuff like that. Uh yes, if it is limited vocabulary usually it's enough. Yeah we we can uh target, means we can target ninety five percent accuracy or somewhere ninety seven perc That's right. No it it could be little d yeah it could be That's right. That's right. Mm-hmm mm-hmm. Uh it's more like, means there are different speech technologies which are existing so D\_T\_W\_ could be kind of which is the easiest. So you have to store some templates on the on the on the chip itself, and it's just dynamic time warping where you try to find out what it is, instead of having a model which has to be trained and being a micro-controller. Yeah, that's right. Yeah. So we can That's right. Yep. Yep. No no. Components. Yeah. So, will you go to the next slide? Yeah so this is the design which we are thinking so. We are having a power button and the switch, which is not much, and then we are having the which is to indicate whether the power is on or not. And then there are two kind of things which can be so one is the button interface which has not been shown because because of lack of time. So we could not put that. So now where the A\_S\_R\_ decoder is sitting, similarly there are different kind of interfaces which could be there. So there is A\_S\_R\_ decoder which could be there, and then there could be another scroll button scroll scroller, and then there could be buttons, and all of them they will just do the decoding and put it in the math put it in the proper message format. And then there is there is the chip which is sitting, the green one, and it converts it into bit codes, and that bit codes are sent by the infrared device to the receiver. So this is the easiest design the there could be. So th an A\_S\_R\_ decoder we can have things in. To have different technologies. So this was the my personal preference was that we can have A\_S\_R\_ sitting there on the remote control. Yeah. Yeah but

uh as soon as you try to put the microchip kind of thing or something the price will go up. So these are the slight problems. Because yeah the reason is that if we go into the market means though I don't have much idea, but as he the uh Marketing Expert presentation was So if we go with just the Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Alright. It's not possible. It's impossible. Are But just a small thing, what kind of market we are targeting? Is it that we are targeting the replacement remote market, or what? So the remote has gone bad and the person wants to buy a new remote or because the cost of L\_C\_D\_ thing could be as high as the T\_V\_ itself. That is very important. Broke. Okay. Okay. Okay. Okay. Okay. Okay. Mm-hmm. It's it's cheaper as compared to the L\_C\_D\_. Means th yeah twenty five Euros is yeah, that's right. Okay.

---

# Meeting ID: 13

Data Source: Train

## Executive Summary

I will open our functional design meeting . we will have the three presentations from the Industrial Designer , User Interface Designer and um And after that we uh will have the uh new product requirements , I suppose the first to do the presentation will be the User Interface Designer . Um , so you're participant two ? did you save your presentation ? One one . I'm participant one . Three Isn't that technical functions ? it's David Jordan . Course . The first I will present the technical function design for user interface for our uh remote T\_V\_ control . remote c rem remote T\_V\_ control it's very has very soph sophisticated functions , so we want to design uh elegant , easy to use inter interface . A very good example is Google . So my job is to uh design a Google T\_V\_ controller which I want to have sophisticated functions while with very easy to use user interface . So you propose to to have the remote control which will be powerful . With sophisticated functions , and very easy to use . it's maybe difficult to have both , I mean the the one on the right doesn't look so simple But if we have very very good user interface it take less time for user to learn how to use it . but the question is how to merge you know the Google system to the system , alright . As you all know , you know m my job is to design you know uh to give an industrial design of the remote control . I propose a nifra infrared base I think it's cheaper than laser , so . what you find inside the re i the the system here inside it is just , you know a bulb and an infrared bulb , I have some kind of pictures and you have the other subcomponent There's a wire with remote control ? I think it should be wire wireless re remote con and you know because you f the b the the battery problem can hold you know will you use a battery or the a wire to connected you . So you think that uh a cable between the remote control and the T\_V\_ won't be a good idea . maybe it will be cheaper I dunno but as Industrial Designer , do you think that it will be feasible to have uh linked or to have link between the remote control and the television ? Do you think it will be cheaper ? Could you answer please ? Have to think about the question , but I think the wireless problem is more the um David Jordan's problem . Mayb maybe you have just to to kind of research If when you have wireless remote control and if you lose it ? I think it's would be easier to have a link between the remote control and the television , So just trying to answer all the questions , We had one hundred subjects , um , we observe their remote control use in a lab and then after all the experiments they had to fill up a questionnaire , um , Um actually seventy five percent of the users find m the most remote controls uh ugly , Yeah , the the look is is bad for them Then eighty percent of users would spend more money um actually if if the remote

controls were not so ugly . And then um yeah , the remote controls like the one you've shown previously it's not so doesn't fit the user requirements sometime , because it's too many buttons and so on . And uh users are actually zapping a lot , ten percent of the buttons are actually used in the remote control . remote controls are often lost somewhere in the room . Um it takes too much time to learn how to use the remote control for thirty five percent of the people . And uh remote control are really bad for R\_S\_I\_ problems for twenty six percent of the users . R\_S\_I\_ is like , when you're using the same um doing the same movement several times , then you get injured . Um so my personal preferences for this problem is we have to meet the user needs . If we can make it look fancy then we might sell more than our uh concurrent , And definitely if it could have less buttons , still maybe the same number of um functions , but less buttons , And just to have uh an idea , do you think you as the User Interface Designer to would it be possible to have less buttons and still have the same functionality and to have powerful remote control , you think it's possible ? Yeah , I think possible . Because we can We can uh mix uh several function in one button . but do you think it will be easy to use ? Because if you have many functions just for one button it would be quite difficult for the user to know . you you can have a switch menu , but it has to be intuitive . For example , if you have remote control you you can rem you can control your T\_V\_ and also you can control your uh recorder . But what I'm not so sure is about how to make the remote control look funny look fancy , not funny . Because different people have a different opinion about fancy . You know . I think the solution is to have many colours of you know instead of having one grey standard but I think it will increase the price of the production of the remote control . Maybe we can have di di we can have uh several options , so maybe just having many functions in one button is not that good if you want to zap a lot . new information about the product requirements , the first one is that um for the designing of the remote control we don't really want to use the teletext anymore , because so it's better to use internet then teletext . and also the remote control will only be used for television , you won't had um buttons to just to manipulate yeah to control the recorder or maybe the garage door or things like that . So maybe it will be easier for you to to design it , to have very powerful and easy . which will be used for for the television , for the recorder , for the camcorder and all the others , it will become too complex And also we want the image of the uh um real reaction be recognisable in the product , such as the colour and s the slogan . So has to be yellow . As we say , we put the fashion in electronics , so it has to be a fashion remote control . Fancy , fashion , powerful , easy to use . Require lot of requirements , but this this mean that your T\_V\_ would be able to , you know , connect to internet , you know , surf the web . There's that box in the T\_V\_ , so with the set box you you can connect internet with your T\_V\_ . I don't think it's popular , I think it has to be yellow . I think if you have you know th like a yellow ribbon here is the double R\_ . Or should be . Doesn't need to be completely yellow , I will close the meeting , um just after that we'll have lunch break . And you will have in thirty minutes individual work . and the User Interface Designer to work on the user interface concept . You will have as the I\_D\_ I don't remember what is industr Industrial Designer to put um pon Component component , yeah . And so specific instructions will be sent to you by your personal coach . I think the um session is closed . And by the way , Mister David Jordan , please record your presentations in your own folder . Not in mine . Regarding the first line , what So we're just expecting no more use of the teletext . But I dunno , but why , I think it would be simpler .

## Complete Meeting Transcript

Mm-hmm. Marketing Expert. Mm. Okay. Yeah. No sure. Uh it's David Jordan. Course. Mm-hmm. No, no. Uh this one doesn't want to be moved, I think. So, I dunno, it's maybe difficult to have both, I mean the the one on the right doesn't look so simple and Yeah. Yeah. Yeah, and then Yeah. Oh it should okay, yeah. The user should know. Yeah, that's gonna be the trick. Okay. So that's the point. Mm. True. Okay. What the cost is? Twelve, twelve a half. That might just So. Okay. What's the average price of this technology then? But this is what you would like to ask the user first and I don't think the user would be ready to have a I don't think well, yeah, I don't think he would, but in a sense The wire? Yeah. True. Uh that's my job. That's the Now the Yeah. Well that's actually one of the point, yeah? True. This you will see in my presentation then. Yeah. Which is participant four. So just trying to answer all the questions, if the user would be happy to have something or something else uh. We've made a study, so could you go to next slide. Sorry for the functional recurrence. So that's the standard method for marketing, okay. We had one hundred subjects, um, we observe their remote control use in a lab and then after all the experiments they had to fill up a questionnaire, um, and see what was okay or not for them. Okay. So then it's some statistics about what we observed and what they answered. Um actually seventy five percent of the users find m the most remote controls uh ugly, okay, so that's Yeah, the the look is is bad for them so uh it's your job, David, maybe. Then eighty percent of users would spend more money um actually if if the remote controls were not so ugly. So this is where we could have uh yeah, good market, I guess, if people are ready to pay more. So it's it's interesting information, I think. And then um yeah, the remote controls like the one you've shown previously it's not so doesn't fit the user requirements sometime, because it's too many buttons and so on. So we should change this as well. And uh users are actually zapping a lot, so they're using the device intensively, that's something to take into account as well. And um, you know, ten percent of the buttons are actually used in the remote control. And uh this is one of the main point for me. But I'll come back to it later. 'Kay. Could you go next slide? Uh, so as you said uh, remote controls are often lost somewhere in the room. So this is from the experiments we've done, so if we could solve this problem this would be interesting for the user, I think. Um it takes too much time to learn how to use the remote control for thirty five percent of the people. And uh remote control are really bad for R\_S\_I\_ problems for twenty six percent of the users. R\_S\_I\_ is like, when you're using the same um doing the same movement several times, then you get injured. Okay? So, those numbers are less important then the previous one, but still it has to be taken to count. So last slide. Um so my pres personal preferences for this problem is we have to meet the user needs. If we can make it look fancy then we might sell more than our uh concurrent, okay. And definitely if it could have less buttons, still maybe the same number of um functions, but less buttons, this would definitely be a good way of selling more. Okay. So Yeah, remember the user is not happy to read the manual. It's Yeah. Yeah, this is something we sh But this was first step and This was the first step, yeah. Specially distribution, yeah. Uh Yeah, but this is what we would ask to the users, so. Yeah. Yeah, remember it's twelve Euros. Hmm. Yeah, it's done, just yeah. If we would if we could remember like, not too many buttons and make it look fancy, I think it would make it. So. Lame, or Mm-hmm Yeah. Mm-hmm. So has to be yellow. I don't think it's part of the remote control design anyway. It's maybe more in browsing. Yeah. Hm-mm. Mm-hmm. Min Yeah. Regarding the first line, what So we're just expecting no mo

re use of the teletext. And that's it. It's already changed for Mm-hmm. Industrial Designer. Yep. Okay. Yeah. Industrial Design. One one. Three three, it's three sorry. In one, sorry. So you didn't save it maybe. Alright, so David Jordan? Mm-hmm. Too great for email then. Yeah. To merge the two system huh. Mm yep. But But this is Yeah. Yeah you maybe you have some international standards, where you know, if you can use one is the other are or almost the same, so the sign. Yeah, yeah. For example, I dunno here, escape, you know, you have escape in computers you have, so if you see escape, you know that it should be the same. So you have to The sh the user there for example the power off button it is something very international, you know that So. Yeah. So. Yeah, but the question is how to merge you know the Google system to the system, alright. That's your job It you Okay, okay. Participant two. Yeah. The rationale must be design, or So we can move to the next slide. As you all know, you know m my job is to design you know uh to give an industrial design of the remote control. So the re basically the remote control will be, you know, infrared control, so the problem is how to relate the how to relate the remote control device, like for example this one I h I'm holding in my hand and the T\_V\_. So, this one is leather bu based but I propose a nifra infrared base you know, so so for me I think that it is better it's bet it's better to control T\_V\_ so you know, so it's it will be cheaper and it is less technology than, you know For the cheap price we have, for the cheap price we want to I think it's cheaper than laser, so. Yeah, I think for the cost we want for the cost we want it's better to have uh uh Let's see. Yeah. You can move to the next slide, so. So the di the differen the findings you know what you find inside the re i the the system here inside it is just, you know a bulb and an infrared bulb, so here for example the infrared bulb will be here and the bulb it will be somewhere inside. You can go to the next slide. I have some kind of pictures you know, here. You have the b the bulb, it is a blue the blue stuff here and the infrared and the infrared bulb it is the red stuff you know and so and you have the other subcomponent that are not really here so important, so. This is in fact some other component that are in between the electrical de the electronic device. Look. But here what I wanted to emphasise it is just you know the bulb and. So and the next slide, it is the last one it's So it's I think it should be wire wireless re remote con Because you know, it's easier to manage and you know because you f the b the the battery problem can hold you know will you use a battery or the a wire to connected you. Or maybe some kind of thing that we can have both, but you know, I at my side prefer a wireless. Okay, so if you have some question I didn't answer? Well the avera the average prices I think that this technology will cost, I dunno, around eight Euros, so. Or at least you know, the You'd yes, you can. It's so so bres you have to decide how how you will you know, put some energy inside, so you can think about wireless or you know it's it's a question that we can raise, so. We can think that you know, with the wire, you know, without a wire. We can have both also. Yeah, but some pa I always want to have you know, sometime I want to have wire because you know. Uh, I don't think it will be too much. Have to think about the question, you know, 'cause it's I think that you know you can always you know I think wha wha with the wire it's mm cheaper but you know the wireless it's more practical, so. Okay, yeah. Yeah but, it should be an agreement, you know, because even if you can think of the wireless, it is it's it is the job of the the the g Graphical User Designer, but you know. If it is a lot cheaper and if you want to reach for example some the the money you have, if you want to use, so it can be good to have a wireless, it

it is a question. Right, so. Okay. Mm-hmm. The look, how it look like. Yeah. Yeah. Okay. Okay. The manuals. With a Look fancy. This is a question that should be asked to the If you ask the people, maybe the the marketing people. I think the solution is to have many colours of you know instead of having one grey standard Yeah, yeah, maybe. Yeah, maybe. Yeah, yeah, yeah. Yeah. Yeah, hmm. Yep. So. Yellow. For cheap remote control, yeah. Yeah. Yeah, 'cause what I'm thinking is how will you

will connect the T\_V\_ to internet, so. This is Yeah, but this this mean that your T\_V\_ would be able to, you know, connect to internet, you know, surf the web. Okay. It's pop I don't think it's popular, so that's the problem so. You had i if you are designing a remote control for you know the global usage, so if people don't have the technology. Yellow? Do you think that people like the colour yellow? I think if you have you know th like a yellow ribbon here is the double R\_. Or should be. Yeah, so. Doesn't need to be completely yellow, but just mm. But I dunno, but why, nobody's a threat to me. Industrial Designer, yeah. Component component, yeah. Good. Okay Okay, that's clear. Okay. Okay. No no no. One. I I think I'm a. In one. It's mine. Mm yeah. Okay. Okay, so. The first I will present the technical function design for user interface for our uh remote T\_V\_ control. Uh I I will focus on user interface design. Um so move to the next slide. As we know our remote c rem remote T\_V\_ control it's very has very soph sophisticated functions, as we show from this picture. There's a lot of functions. Over, I think over s twelve or twenty s functions of a remote T\_V\_ control. So how can we um design a user interface with so sa with so many sophisticated functions? Um, let's move to next slide. Um. Yeah. So I so we want to design uh elegant, easy to use inter interface. A very good example is Google. As we know uh Google it's a very successful because his um powerful function, but with very easy to use user interface. Um so move to next s slide. So my job is to uh design a Google T\_V\_ controller which I want to have sophisticated functions while with very easy to use user interface. So That's the end of the talk the end of the presentation. Uh With sophisticated functions, but with very yeah powerful. Yes. Yep. Yeah. But if we have very very good user interface it take less time for user to learn how to use it. Yeah, that's my job. That's my job. It's not the easiest I've got to. Yep. Powerful and easy to use. Yeah, that's the point. So what, the wireless remote control? There's a wire with remote control? Okay. Okay. Okay. Wireless remote control. Okay. Mm-hmm. Mm-hmm. Okay. Design a wireless remote control. Yeah. Functions. Yeah. Yeah, I think possible. Because we can We can uh mix uh several function in one button. So lets you then you have less buttons. But I'm not sure No you you can have a switch menu, so you can well for example Yeah, I think so. Like for for example you can uh you can category the function i i into several classes. Then for um you can have a switch menu, so you put the switch menu to it it tend to this kind of this category of functions. Then you you put the switch button, then it switch to another category of functions. Yeah. For example, if you have remote control you you can rem you can control your T\_V\_ and also you can control your uh recorder. So there's a different functions, but i if you you there's a button you can switch between control T\_V\_ and control your recorder. So we can has less buttons. But what I'm not so sure is about how to make the remote control look funny look fancy, not funny. Because different people have a different opinion about fancy. You know. Because maybe a colourful is fancy for some people, but maybe simple and uh uniform colourful is fancy for some for other peoples, so. Yeah, personalised colour. Because you know Yeah, because maybe some people prefer a red remote control, some people prefer

black remote control. Maybe we can have di di we can have uh several options, so user can select which colour they prefer, so. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. Mm-hmm. Mm-hmm. Yeah. Control. Mm-hmm. Mm. Okay. But there's balance between function and the cost. Yeah. Okay. Mm-hmm. Mm-hm. Okay. Okay. Okay. Mm-hmm. Yeah. And cheap. A low cost. Yeah, there's that box in uh o of it. A pi There's that box in the T\_V\_, so with the set box you you can connect internet with your T\_V\_. Ok It's It's not so uh popular now. Mm. Global, okay. So I I so As as for the colour, what what do you think? Yellow? T\_V\_ remote control? Okay. Okay. Okay. Okay, okay. Okay. Mm. Okay. Okay. Okay. So, I will open our functional design meeting. So, I will play role of the secretary. As also Program Ma Manager. So, we will have the three presentations from the In Industrial Designer, User

Interface Designer and um What's your talk? Marketing Experts. And after that we uh will have the uh new product requirements, the decision on the remote control functions, and we will close the meetings after. Mm so um I suppose the first to do the presentation will be the User Interface Designer. Um, so you're participant two? No you're No, I'm participant one. Okay, never mind. 'Kay, did you save your presentation? Isn't that technical functions? Name's Jordan. So so I'll I let David Jordan do his presentation. Uh. Mm. So you propose to to have the remote control which will be powerful. So powerful, many functions and very easy to use. You mean this one? Yeah you have to learn the manual before using this remote control, I suppose. Oh you mean for the yeah pic pictograms or things like that? Yeah um such as maybe the Go on, go back and So, you will propose us something which is yeah so powerful and easy to use. Okay. So, next I propose the Industrial User Interface to present things. So you you're Um. Okay. So, Baba is the uh the Industrial Designer. Okay. Mm-hmm. So you mean that infrared control is a cheap technology? Yeah. Do y you know the requirements for the remote control? Twelve, nearly thirteen, yeah. The cost Mm-hmm. Okay. Yeah. What is this? Okay. Okay. Okay. So you think that uh a cable between the remote control and the T\_V\_ won't be a good idea. No it wou maybe it will be cheaper I dunno, I just may maybe you making a solu Yeah, but Yeah but as Industrial Designer, do you think that it will be feasible to have uh linked or to have link between the remote control and the television? I'm just asking you. Do you think it will be cheaper? Could you answer please? Okay. Yeah, but I think the wireless problem is more the um David Jordan's problem. As it's yeah. I think it's more your problem. Mayb maybe you have just to to kind of research or try to ask people if they will like something wireless or not. Okay, I'm sorry. So So just think of um the usability. Yeah. Just think of the problem. If when you have wireless remote control and if you lose it? I think it's would be easier to have a link between the remote control and the television, yeah. So I will let you to do your presentation, so. You mean the loo the look, the outside? Okay. Mm-hmm. What is R\_S\_I\_? Ah um okay. Mm-hmm. Mm okay. And just to have uh an idea, do you think you as the User Interface Designer to would it be possible to have less buttons and still have the same functionality and to have powerful remote control, you think it's possible? Sure? Yeah? Yeah. Yeah, but do you think it will be easy to use? Because if you have many functions just for one button it would be quite difficult for the user to know. Yeah, I think the Yeah, but it has to be intuitive. Yeah, okay. Okay, but Yeah, but Mm-hmm. Yeah, but I think it will increase the price of the production of the remote control. If you need to have special colours for remote controls it will cost more. Yeah, it will cost little bit more. And also f Yeah, but as soon as you speak about options, it means that the price increases, and we don't really want the price to be too too high, because we wanna be able to produce it. So, we want something fancy, as uh previously said, Florent, something very easy to use, powerful and also as uh it's written here, seventy five percent of users, they zap lot, so maybe just having many functions in one button is not that good if you want to zap a lot. And they don't really want to zap between functions of their remote control, they want to zap between channels on T\_V\_. So I think you have quite lot of points to to think about and to discuss it with uh the other members. So, is it okay for your presentation? Nothing else to to add? Mm-hmm. Okay. Mm so So, I had some new information about the product requirements, so you will have to take care of it of it in your thinking, in your designing of the remote control. So the first one is that um for the designing of the remote control we don't really want to use the teletext anymore, as it's something that's It's is uh No yeah, because now everybody has internet at home, so it's better to use internet then teletext. So, you will have to think about it in your in in the design of your remote control, and also the remote control will only be used for television, so for y for you your designing, you're not you won't be uh you won't had um buttons to just to manipulate yeah to

control the recorder or maybe the garage door or things like that. It's because if we want to do remote control which will be used for for the television, for the recorder, for the camcorder and all the others, it will become too complex and it will increase the price and we can't do that. We really want to focus on the remote control for the television. Is it okay? So maybe it will be easier for you to design it, to have very powerful and easy. And also we want the image of the uh um real reaction be recognisable in the product, such as the colour and the slogan. I mean that's uh if uh you want to buy a remote control and if you go in a shop and if you see the remote control you will recognise directly that it's our product. So you will have to use the colour of the product, of the um um of the uh of real reaction and uh also Yeah. As we say, we put the fashion in electronics, so it has to be a fashion remote control. Fancy, fashion, powerful, easy to use. Require lot of requirements, but Yeah. Yeah. But uh that's your job to find something mm matches. Maybe not, but maybe So. So everybody is okay with the new requirements? I think it has to be yellow. Yeah. Maybe you can change the colour, but the image of the society has to be recognised. Why you go It has to be fashion. So you have to Yeah. It has to be a fashion and really be uh the image of the society. Just when you enter you say oh, oh, it's real reaction. Think it's a real reaction remote control, so. And also it has to be attractive, of course, because if you want to sell to sell the remote control. It's okay? Yeah. Yeah. I think it would be simpler. Okay. So I will close the meeting, um just after that we'll have lunch break. And you will have in thirty minutes individual work. Uh Y you You will have as the I\_D\_ I don't remember what is industrial Designer to put um on yeah, and the User Interface Designer to work on the user interface concept. And Florent to work my subject. And so specific instructions will be sent to you by your personal coach. It's okay? I think the um session is closed. And by the way, Mister David Jordan, please record your presentations in your own folder. Not in mine. Should be better.

## Executive Summary

The Project Manager introduced the project to the group. The group set an agenda for the meeting and discussed the materials sent to them by the Account Manager. They discussed and explained their roles in the project. The group began a discussion about their initial ideas for the product. They discussed several usability features: adding speech recognition and an option to choose what to watch by channel or by content, reducing the number of buttons by using the television screen to display options, and adding a light adaptation system. All participants were instructed to gather more information for the next meeting, the functional design meeting.

## Complete Meeting Transcript

Good morning. Or you can put it in the shared folder. No, I didn't get it. This one. No. No,. I think it's for your guys to how to design it all the aspects so you need that information. Yeah I think assign your uh roles. For each person, yeah. Uh, I'm into marketing. yeah nothing much in the project. Marketing in this design. A design is basically for industrial design and the user interface. Yeah, this is. Yeah, that's right, first. us user define. There's a trend watching. Yeah. I mean working remotes we already have. This will be something different from the other remotes remote controls. Yeah, that's right. I'm a okay. I mean the main uh function of remote control is to have something in the hand and we should be very careful about the size of the remote control. If we are going to add a speech interface, I'm not sure with trendy slim size of the remote control it would be able to put a speech recog if you want to put a speech recognition system f interface for that I think the T\_V\_ itself could have it. And I could talk to the T\_V\_ television itself. I need not have an I mean we have some or something, different technology but Mm-hmm, yeah. And another interesting idea for this would be to have an light adaptation system depending upon the picture of So, I mean, if you're watching a movie and suddenly there is a dark uh some dark scene, the lights adapt themselves. The lighting in the room changes. I mean, we have a option in the remote control. If we want to have that option, you press that button in the remote. Oh, I'm afraid you forgot to put your lapel. The lapel. Yeah, that one. Just plug it. Yeah, that's right. Good morning. Well, I think we should set the the points to to drive the project and uh Yeah, from the account

manager. Yeah. Yeah, I think so. I think our uh responsibilities will be assigned when we in our mail we received from the account manager. Uh No, I'm doing the interface. Yeah I I'm I'm Well, maybe we have okay so I industrial design. It was a little confusion about my uh but it's alright. Yeah. User. Well, I think we can have a little discussion about what has to be done and what are your ideas about the Well, w we want to have a new re remote control for for T\_V\_ distribution I guess. So we have to plan how how it would be developed and uh how we can make it work. Yeah, I dunno I Yeah. Well I I think that Norman and I would think about um the technical points and um we should discuss it in the next meeting, or Yeah. Well, you have to make it work. That's the that's the big thing. Yeah. We can think about an interface with uh well Yeah, yeah. I I think if you want t to choose uh from a list of programme or or something like that you you may have to to use uh w uh I dunno Yeah. Yeah. On the content. Yeah, yeah it's it's a good idea it's a good idea but I I think that technically it would be um a little bit uh uh more tricky to to achieve this than just to Yeah yeah. Well I I I think that j just by using navigation buttons and the user interface on the screen we are able to uh navigate uh through the Well channel programme or contents or in an easy way, so Yeah in the dis display on the T\_V\_ screen and just uh with the with your remote control would just navigate through the f Yeah, yeah. So I think for for the technical points we have to to to check how to gather the data from programme or contents and all this stuff Oh right so Please, Norman, draw uh Okay. Yeah, by content or by channel, it's a good idea. And uh we we have to find a way how to gather information about the contents. Yeah. I think i it's not very difficult to to browse by channel but it's a little bit tricky to browse by contents so I think that's the the things to do and uh to uh reflect about it and uh discuss it in the next meeting. Okay. Thank you everybody. Okay. Good morning everybody. So, we are asked to to make uh uh a new remote control for television. And the characteristics of this new remote control should be original a

nd trendy and of course user user friendly. So people can can use it without any any problem.. I don't know. Uh, not yet, but if you want Do you want do you want me to send you a mail? Or Uh. You get email,. S For each for each one. So there are so we have three f yeah. We have functional design, conceptual design, and detail design. So, who will be the the responsible for the functional design? Any any volunteer? You are doing th. Okay, I'll for industrial design. Okay. And and you Norman? And And doing the marketing. Nothing related here to the Next. I don't know. I. About the design or Maybe we'll discuss this later, no? Mm-hmm. What we we have to keep in mind the these characteristics. And of course it should not be very costly. So About the about what? You mean the external or Yeah of g of course. Yeah. You won't I I think if we include a lot of technology on the remote control it will be very costly. S Like s uh you you you say we can use speech. In the hand. Yeah. Except if if you are far from the T\_V\_. This is it's Mm-hmm. Mm. Yeah we should also optimise the the number of buttons. This is good idea. So we have five minutes to Ah you can y you can you can use it if you so, can we S You it. Yeah. If if you you you can if you want you can use th the. Or before the before the the design that says. Norman. Be before before writing you can uh sit and that says what we what we said then after that you can you can use the. Yeah. Okay. Yeah. Mm. Okay. So maybe we'll meet in maybe five minutes? And we'll discuss the other other aspects. Okay. Well thank you all. Hmm. Good morning. Mm. B did you send us an email about this? Yeah, we we received an email about this uh d designs. Ah it's Okay. Yeah, you see the email? You email. The v very no, no the first one. It's inside. No, no. The third one. Oh, you didn't get anything. It's strange. Mm. I got an email about the dis about the discussion. Yeah. I dunno from who. From the account manager. You have received the same email, right? Yeah. Yeah. Yeah, so each of us has a role to do. In each We already have our role. 'Kay, we can So there are three kinds of designs, that's all. Okay, alright. Yeah, yeah. I'm doing the interface. Are

you using the you are doing the in Ah Okay. Mm? Um working on i. User interface. Yes. You see the second mail? Yeah, it's inside. Go down. Appendix. See there's a role for everybody. Even for the marketing. But look at your role, your marketing role. Yeah, that's your role. Mm. Yes. Mm-hmm. Need to collect information. Um. I I'm part of design, perhaps. Uh, what is most important in a in a remote control? What is the most important function aspect? Uh. That's alright. Yeah, it should be easy to work with. Yeah. Uh. We maybe you can have a speech uh recognition interface. You just tell the television I want which channel. Or or you can say for example, um I want uh to list all the programme tonight. Y you know, instead of uh remote control it's doing the some searching for you, so you don't have to look for the channel you want. Just say maybe I just want to press I wanna have a button for all the movies tonight. Or a button for all the magazines, all the information documentary tonight. And then you list a few, and I will choose from the list. So instead of pressing the channel number, I am choosing the programmes directly. Yeah, that's one way of uh making it useful. No, because no, it's not very a lot. Th this information exists. For example you can get um You can use uh well for example anything. The the idea of using speech to reduce the button, but uh and it's more natural. Yeah. Yeah. Yeah. Yeah. Yeah. Yes, possible. Yeah. But Yeah. Yeah, yeah. But th the main idea I wanted to s I wanted to say is that um there should be a function, instead of choosing the ch T\_V\_ channel, there's a option you can choose, either T\_V\_ channels or or pr or the or the contain or the contents of the programme. So it's more powerful. Yeah. No. No, because you see now all

the T\_V\_ programmes are available on the webs. They they are they are they are available in X\_M\_L\_ format or whatever the format. We don't care. We just say that this are some content. We just want to retrieve the content and then classi sort them by the types of programmes. Some of the websites they already provide this service, so we can just use the service available. Download it uh to the to this remote control. And then there's there are only six buttons for six categories, or sev seven. The most there are only seven buttons. So I just choose the category one and you reuse the same button, for example to to choose among the the sorted list the programme you want, so you don't have to choose among hundred channels, if you have hundred channels, you just have six buttons, seven buttons. Yeah, yeah. Yeah. Ah, yes. So. Yeah. Yeah, so you don't have to display here, just display on the T\_V\_ screen, right? Good idea. Okay. I think I think that will be revol revolutionary. Because all the T\_V\_ uh the the remote control have all numbers, lots of buttons and then you dunno what to choose in the end. Yeah. Alright. Okay. Ah w w we have sometimes to use the white-board. Five minutes. Okay. Okay. Yeah. Yeah. Yeah, but we are designing just remote control. Okay. Okay, do you want to have a conceptual remote control there, or you just want to put the function in? Go on, draw something. Mm. Where is it? Ah, okay. Where where is it? Here. Mm. Mm. Okay, alright. So so the most functional des mm the most important function is to ch choo buttons to choose the content. Right? We agree on that, right? Uh, uh first one is to uh buttons i or it could be anything with buttons. Uh to choose uh content s or channels. So we have both. The user can choose w which one they want, right? By content or by channel. Choose by contents or by channels. So And then what did we say just now? Other than this. Okay, so technically how the problems that how to do it is to how to get the content. Challenge. Okay. Content. Okay, so these we have to work it out. So this one of the problem. And uh The main thing. Okay. Alright. Alright, okay. So we are we'll discuss it we will get some information in the next meeting, so for now we get uh the funct this is the functional designer? That's the first aspect. Right. We will get information and then we'll come back in.. Yeah, we'll come. Alright. Alright, okay. Thank you, mis

---

# Meeting ID: 26

Data Source: Train

## Executive Summary

I have a little problems with my laptop . And uh s s s so I had a little less time to complete . Um , it didn't work anymore . The entire Windows uh Welcome to the conceptual design meeting Uh uh , also this time there will be uh three presentations . And we um must uh reach a decision on uh the remote control concepts . Um uh , and at the end , uh I uh , when I finish it off I have some uh input from uh a master class I uh visited . information . I will take notes uh and at the end of the minutes uh will uh be at the shared folder . I'll be talking about the components . Uh , what I did was I reviewed previously used items uh by uh two two uh different uh age groups . Uh below forty five and above . senior citizens uh They , well , they like more the they like the traditional materials , like wood and and such more . And uh uh they like uh straightforward shapes . where whereas the young and dynamic , they like a more uh soft materials . Uh uh , soft and fluffy and colourful and But uh the two basic sources that I found were the best possible were the battery uh versus kinetic . Or you can go for both ? But uh the thing is about solar panel is you have to have I uh light . Uh , and you you could you could use normal light , but uh you wouldn't get the same amount of energy that you would from a battery or something . I I prefer kinetic because it's uh well , the costs aren't that much higher , and um , ju just a bit more high-tech than than a normal battery . But , what I what Jarek said , you could you could use a battery that you'd just keep it on the recharging whenever it moves . Or but but you could go in a in an double curves . And that's like several different dimensions . Yeah , that gives you a younger and uh more high-tech look , I f I figured . Yeah you could y It leaves more space for creativity . I I ch prefer rubber because it feels uh Yeah . Well , we discussed it in a previous meeting , so I figured I'll just leave it at the L\_C\_D\_ . Uh , you use the battery and w charge it up with kinetic . I I uh I would prefer uh both uh too . but if you have a square uh L\_C\_D\_ screen , and you put a case around it that has uh like bulbs or that that covers part of the L\_C\_D\_ screen . That's it's custom customisable and uh so what are the opinions ? Uh rubber or plastic ? I I I prefer rubber . I went to uh Paris and Milan for some trend-watching . In Paris and Milan , we uh asked different people , uh differing in age and in income , uh the amount of money to spend , um what they like in design uh and material nowadays . Our main audience , uh so that's people below forty , uh prefer the following . At first , the colours of fruit . Um , fresh colours , uh green , red , uh strawberry red , uh yellow , banana yellow . Yeah . They like spongy material , Okay , our secondary audience , uh people above forty a forty years in age , they like the dark traditional colours . Yeah , uh

materials like wood that They have to look fancy . Um , they should be technological in innovative . Uh , and easy to use . We have to aim at a mu at the main audience . And uh , therefore use fresh colours . Here , think about removable covers , as seen in mobile telephon telephone market . To customise your own remote control . Uh , in my second sheet of personal preferences , uh we have to reconsider the speech function uh recognition . You you can see that the market is just screaming for new technologies , like speak uh speech recognition and stuff . Uh , building games like Snake or Tetris to amuse the younger users . And third , I stick with it , the log-in functionality uh with the slogan , take parental control to a new dimension . But , the main concept is um take one big touch screen . Um , always display the primary buttons clear and visible . And uh make the menu structure changeable . One thing you've gotta keep in mind , keep the remote clear of too much functions at the same time . And um , things like teletext , put them in the menu . But um , well m my preference would to be put it in the menu structure . I think we can discuss a little about the the three uh kind of revolutionary things uh Tim uh came with . I think that parental control is a good function to uh to put in the remote . How I see it is you put it on the the remote and then you have like a Windows log-on screen with parents , children . You don't want to to go down and watch the news at eight o'clock and turn it on and wait twenty seconds for for uh the log-on screen and then remember your code and all kinds of settings . You c may use like when there's uh X\_P\_ , uh a simple log-on , d you just push uh one or two or three . I don't know if it's worth uh the time and effort we are going to spend on it . Well I think that's a b there's a big market for it , Just make through a remote as it is , but make an option to insert profiles , I i i if we in incorporate uh the parental control , uh let's say we do , and and well whatever , cho uh child just goes up to the T\_V\_ and presses up for instance . What m what may be better is to incorporate an uh a separate device that uh that you can program with the remote control . Okay . And what do you uh guys think of the games in the voice recognition ? But I don't think when you're watching T\_V\_ uh , hearing loud noises from the T\_V\_ , someone screaming one , and you f the channel switches , uh Yeah . Yeah , like f voice recognition is too much , I think . But Okay . So the games uh are in it . The voice recognition are not . And the parental control are Well , I think also it's a good idea , but very difficult to incorporate . The buttons will be uh touch-screen . Uh but there may not be too many buttons . The case will be double-curved and uh rubber , in a fr flashy fruity colour uh that with cover is removable . Okay . So uh I think we have decided on the things that Uh from Janus , the energy , the combination between battery and kinetic . Like the first idea uh from uh You can buy it without and uh with parental contr control ? Or are we going to put it in and uh just uh I I figure if you had two different remotes , you could bo choose one with uh well uh uh a receiver in it . Well , maybe you just have to restrict it to what programs , where the parent says , you cannot watch channel seven , nine , and ten , and you cannot watch all channels after ten o'clock . But you still have the problem about uh the television itself . You could just blame it on television and uh make it their problem . The parental control will be incorporated , but it must be not too complex . Maybe it's uh handy to build in an expert view and a simple view . What I was thinking about is just a menu structure , when you don't use it is simple . We take it to the other meeting , I went to uh a master class and uh uh two things uh are uh are uh can come in handy uh for us . First thing uh is uh we talked about knowledge uh management . Knowledge engineering and uh uh the fact that uh that uh that the idea of knowledge , uh sharing and learning knowledge from other companies is uh like that . It's it's uh very hot at the moment , so it's it's mostly for the

management expert to to look what other uh What other companies uh had to uh also with the the the the marketing campaign when they put on a newer remote , just some uh Yeah . Import export . I had a I had another idea to put uh uh the whole the whole idea of uh Real Reaction and uh uh uh a single brand and uh uh that kind of thing . When you uh put on remote , you see a kind of a just like when you telephone , you see a little uh animation . And uh with the with the with the motto , we put fashion in electronics . Well , if you if you have the L\_C\_D\_ screen , you can you can uh have a small logo i uh at the bottom . That spins around like all the time . It it's just like a uh globe in Internet Explorer . N Uh , next meeting starts in thirty minutes . the the industrial uh development uh centre and uh user interface uh will work together on a prototype . And uh will drawing it on the SMARTboard . And um , the marketing expert will uh will uh ke he will be keeping busy with the product uh evaluation . But the most uh specific instructions will be sent to you by email . But I think it was a very uh very good uh session , uh gentlemen . But keep an eye on your uh laptops for a real uh

## Complete Meeting Transcript

Hi. Yeah, sure. Okay. Uh, let me see. I think it's this one. Ha. Right. Uh, well, I'll be talking about the components. Uh, what I did was I reviewed previously used items uh by uh two two uh different uh age groups. Uh below forty five and above. And uh I just uh watch what the differences are and I checked uh, well, what what d do we want, and how can we uh d aim a at uh the target group. Well uh what I found was that a senior um senior citizens uh Ye Ah, it's it's okay. Uh They, well, they like more the they like the traditional materials, like wood and and such more. Wood and chrome. And uh uh they like uh straightforward shapes. Um, uh they they they they like luxurious uh styles, where whereas the young and dynamic, they like a more uh soft materials. Think of the Teletubbies, for instance. Uh uh, soft and fluffy and colourful and Well uh, shapes are curved and round. Y y you get the picture. And uh they like sports and gaming, and that gives them uh the vitality. Uh, so w well uh, firs Yes. Yeah. No, I'll I'll get to that. You you'll see. Yeah. Uh, well f first off, let's start start with the energy. W I uh I had a choice between uh a few different uh sources. But uh the two basic sources that I found were the best possible were the battery uh versus kinetic. Uh kinetic, that's when you move something, then uh it gets energy. I figured, well that's ki kinda high-tech, when when you have a remote control that well, when you pick it up, it has power. That would be actually very nice, uh I figured. Well, we could also use a battery, that's a bit Yeah. Yeah yeah, you c just you have to shake it around a little bit. And then then it d then it has some more uh energy. Well, y you could just go for a battery. Or you can go for both? Yeah, I actually did. But uh the thing is about solar panel is you have to have I uh light. Well, sunlight preferably. Uh, and you you could you could use normal light, but uh you wouldn't get the same amount of energy that you would from a battery or something. Uh for uh ultimate b uh n uh use of uh solar panels, you could actually use uh you could use uh solar panels, but uh you ha you'd have to implement them into uh the remote control, leaving you uh a bit less space for the interface. So uh so i i it it wo what's actually I I c just in f I've figured it out that well, uh seeing that you'll always be uh within the I uh distance of T\_V\_, and the from T\_V\_ there comes a a a whole bunch of light. So it would actually power itself uh from a T\_V\_. But, well you just take up all the space, and you wouldn't uh have the full amount of power actually used. So I I prefer kinetic because it's uh well, the costs aren't that much higher, and um, ju just

a bit more high-tech than than a normal battery. I mean, if No, but uh d Well, you pick it up and you press buttons and y well, you Yeah, well uh actually it is. And it if it isn't, you just shake it a bit and and add add with power up again. But, what I what Jarek said, you could you could use a battery that you'd just keep it on the recharging whenever it moves. And for rest, you'd just add juice on the battery. Exactly. And so that Uh Uh well, f furthermore, you you we uh checked uh the cases. We have uh different options uh concerning the cases. You ha I you sim uh you simply add a basic uh standard uh model uh it was kind of square and uh I figured that's a bit boring. So you you we could go for uh the single curved or the double curved. Um, single curve, it's just a well, uh, you know, it's just uh a nice curve. Or but but you could go in a in an double curves. And that's like several different dimensions. That gives you an whole new uh effec Yeah, that gives you a younger and uh more high-tech look, I f I figured. But, that uh we'll discuss later. What? You want me to draw in three-D\_? Uh, yeah, I ca I ca I could I could show you. I could show you. Well uh let's say y uh you uh Let's say that's your standard uh That's a bit your d standard design.

But you could actually go like uh something like this. And then uh in three-D\_ effect you could go So y you you just Yeah, this is a this bit uh difficulty in I didn't take a major in art. So But but you could have uh uh a whole new uh the back back the the the depth, you could you could uh just play around a bit with. You you don't have to use standard uh Yeah you could y It leaves more space for creativity. Uh that might be an idea, but just a Well, furthermore, uh well, uh plastic versus rubber? You We could choose uh what uh what's better, plastic um or rubber. I I ch prefer rubber because it feels uh Yeah. Yeah, it's soft and it's that I like soft. Yeah, yeah I mean uh plastic uh is Plastic also has that cheap feeling to it, like plastic uh Your your I usually associate plastic with uh something that's cheap. Uh that's maybe just me, but Uh, we could uh uh, oh, talk about it later. Uh furthermore, buttons. Uh traditional uh or a touch screen. Well, we discussed it in a previous meeting, so I figured I'll just leave it at the L\_C\_D\_. And uh chip set, well uh if we are going to use traditional buttons, we could go uh with a simple chip set. But uh if we decide to go on a n uh um L\_C\_D\_ screen, we would use an uh we have to use an a advanced chip set. And that would bring uh the necessary costs with with it. So that's something we th have to keep in mind. If it isn't uh manageable uh budget-wise, we'd have to go over to uh to sim to simple buttons. Yeah. Yeah, probably. Yeah, probably, but But uh yeah, that's that's That shouldn't shouldn't be uh that big a issue. I'll I'll I'll just add, uh uh I put a big summary here, so we could discuss it a bit. Uh what i what are your ideas concerning battery versus kinetic? Yeah, you you you should we should A combination. Uh, you use the battery and w charge it up with kinetic. When you pick it up, it charges up. Yeah. Yeah yeah, I know. Yeah, I con Exactly. What uh what do you think? You agree? Yeah? Both? Okay. Uh, well that would bring the m m some more costs, but I mean the Who cares, right. That's the Project Manager's problem. Yeah, well Fifty cent uh Uh, why doesn't And then we have single-curved versus double-curved. That Okay. No, we'll we'll just wait and uh Uh, plastic versus rubber. Any ideas? Uh, rubber? You Uh, I figured it will be m rather than hard Nah, rubber c uh this is a casing, yeah. Rubber casing, because well if you use an uh d a touch-screen, uh it's just a casing uh around it. So um, you could go for plastic, but I figured I I I would choose rubber. Well, m I don't know. No. Yeah. That isn't Yeah, that would cover it. That that would solve the problem. So mm Uh uh so uh so what are the opinions? Uh rubber or plastic? I I I prefer rubber. Yeah, you too? You sure? You you you seemed to hesitate a bit. Yeah, it it shouldn't it shouldn't flop over when you hold it in your hand uh No, that that that that's gonna The the chip set will hold it firm in place, and uh and and uh and a L\_C\_D\_ screen also Yeah it m might it might. Uh, tra uh traditional versus L\_C\_D\_, well I figured we we all set on that. And uh, then also the simple versus advanced. Well I figure if we go

for L\_L\_C\_D\_, we we should have the advanced. So that shouldn't be a problem. Okay, well that's my uh Uh, you're welcome. Well, the Teletubbies sh Well, you could. You you could. Well uh Yeah. Well, I actually saw a phone that you could use as a remote, so Yeah. Hey. That might be a next step. Well, yeah. You take your uh remote with you to school. Yeah. Very nice. I don't know if it's worth uh the time and effort we are going to spend on it. Because well it's a simple function, but it's gonna take a lot of resources and a lot of time um to programming it. Because you'll have to start working with the profiles and such. And I'm not sure if it's actually worth uh investing that much time and effort into it. I don't know what But, well, if you want to I i if we in incorporate uh the parental control, u

h let's say we do, and and well whatever, cho uh child just goes up to the T\_V\_ and presses up for instance. Well uh, nob nobody's stopping the child from uh well checking uh the channel. But that Well, I'm not sure because um for that to happen, you d you will have to receive a signal from the uh remote control, so it would, yeah, have to be constant uh constant signalling. What m what may be better is to incorporate an uh a separate device that uh that you can program with the remote control. And that uh provides parental control, for instance. And that's just an optional uh device. So there's n that's there's uh besides uh the remote control, you'll have a separate uh Yeah? Yeah, that's true. That's true, but uh at same instant, same happens when uh you have remote control. So But, only difference is uh the uh the people buying the remote control will now get the f added feature of parental control, and those people wouldn't uh necessary want it. So, you you'd be Yeah. Yeah. I can see games happening. Yeah. Yeah, that will be nice. Well, I don't know. I I figure if you had two different remotes, you could bo choose one with uh well uh uh a receiver in it. So you could actually easily uh build in uh parental control. But it would would be uh more expensive. So, a and that that way uh you could make cheap model and a expensive model. Could ma make the uh simple model and the deluxe model, uh for instance. Yes they are. Yeah. Yeah, you you have some T\_V\_s any Yeah. That is true, that is true. Well yeah, you could you could easily you could easily you could easily to the mote control. But you still have the problem about uh the television itself. Yeah, yeah yeah. Yeah. Yeah. Yeah, that is true. Yeah, that is true. Yeah, you could you could you could go like uh that that would actually make uh things a lot more easy. You could just blame it on television and uh make it their problem. Yeah, I figured I figure we could do that. Yeah, yeah, sure. Uh, I'm not sure what marketing thinks about it, but User profile. Well yeah, you you could actually build in a function that you can program it yourself, for the more advanced users. Yeah, which buttons do you want to in it. Because you can you can like build in a back-forward button, and uh some po somebody would just want to watch two channels. Yeah, you could you could m have people want uh want that. Ah, yeah, sure. Well, if you if you have the I L\_C\_D\_ screen, you can you can uh have a small logo i uh at the bottom. And it could just stay there. Yeah, that spins around or something. Hmm. Yeah. Yeah, something like that. A small icon. So we're going to work together right now? Definitely. Well thank you too. You wish. M Aye? Cheers. Hey. Yeah, uh I'm not sure if we uh we Because I saw something about individual actions. Well, yeah. Right. Uh Do you have new email? Hmm. Hey, Project Manager. What was it, problem? The laptop? It hang hung. Ha-ha. Oh. Project Manager. You're our Project Manager. Master. Master of I'm sorry. Okay. Go on. Yeah but when the power gets low, you have to shake it or something? Uh, and uh uh Hmm. Mm yeah. It's too less space. And when the battery doesn't work, I usually shake it too. So Like slamming on it. It's exactly the same. Hmm. But, are you going to draw it? The Yeah. Yeah. Uh, I c I can't imagine. I can't imagine how how how it looks like. Yeah. Design. Mm-hmm. Uh Oh, okay. Okay. Oh, okay. Okay. Well, I think uh we're going to sell tell ten millions of them. So uh I bet a big company in uh Korea or Taiwan, like uh Samsung, can give us uh a big discount on the chips, so U usually, chips are uh aren't more

expensive than one dollar. So That that shouldn't be a real issue, I think. Yeah, a combination. Yeah. Like an uh aku uh Acu uh, yeah. Well,. Yeah. Combine them. Okay. Of course. Fifty cent. Rubber. Rather hard. Yeah. Well, I think that touch-screens are generally square. But it's the case you put around it that makes the shape. Hmm? Yeah okay, but if y

ou have a square uh L\_C\_D\_ screen, and you put a case around it that has uh like bulbs or that that covers part of the L\_C\_D\_ screen. That That's it's custom customisable and Yeah, me too. Mm yeah. Yeah. Can I uh do my thing? It uh Expert map. Okay uh Last week I went to uh Paris and Milan for some trend-watching. For marketing. Our research and development department and I went to Paris and Milan. In Paris and Milan, we uh asked different people, uh differing in age and in income, uh the amount of money to spend, um what they like in design uh and material nowadays. Findings. Our main audience, uh so that's people below forty, uh prefer the following. At first, the colours of fruit. Very basic colours, like Janus explained. Um, fresh colours, uh green, red, uh strawberry red, uh yellow, banana yellow. Um, considering material, um Yeah. They like spongy material, like yeah a sponge-ball. Like a soft material. Janus m uh mentioned it also. I think he did some uh some findings himself. You wer you weren't in Paris? Okay. Like this. Like big uh g flashy colours. Fresh. It's nice, I think. Okay, our secondary audience, uh people above forty a forty years in age, they like the dark traditional colours. Uh Yeah, uh materials like wood that No n j just j just a w No, okay, but just just a wooden uh look. Like uh you have those fake uh fake panels on the floor. The that isn't wood anyway, but Okay? But, that's our secondary audience. So, uh we decided to take mm yeah the people below forty. So, that this doesn't apply. 'Kay, the third. Uh, there're some overall thoughts about new remote controls. They have to look fancy. Um, they should be technological in innovative. That means uh there have to be fancy things in. Uh, and easy to use. But that's common. My personal preferences. We have to aim at a mu at the main audience. And uh, therefore use fresh colours. Uh, I'll I'll come to that in a second point. Here, think about removable covers, as seen in mobile telephon telephone market. To customise your own remote control. Like the Nokia uh the removable covers, uh just put a red on it and go to the shop and buy a green one. Uh, a third, material being used uh could well be stuff like rubber. Um, two advantages. Uh, it fits within the current market trends. And uh it adds safety to your remote uh when you drop it. So Uh to come back to your question, I think uh and the people in Milan and Paris also think that uh the rubber should be pretty hard. Like uh seen on regular mobile phones. Actually, they have a lot in common. The phones and the Yeah. Yeah. Okay. Yeah, exactly. Uh, in my second sheet of personal preferences, uh we have to reconsider the speech function uh recognition. Uh, it's very innovative. Innovative. Yeah, like something. You you can see that the market is just screaming for new technologies, like speak uh speech recognition and stuff. But, we have to keep the cost in uh in mind, but it Yeah, it can be uh very expensive. 'Kay, second. Uh, building games like Snake or Tetris to amuse the younger users. Uh, also the link with uh mobile phones. Uh No, but No, okay. But you don't use games when you're d when you're making a telephone call. It's just the same. Yeah. When you're at college. Uh No. You al you also take uh t you take your IPac and go uh play games. Yeah. Yeah. Well, I do that, but Okay, and um And third, I stick with it, the log-in functionality uh with the slogan, take parental control to a new dimension. That's it. Yeah. Uh, what do you think about a back-and-forth come-up uh button? L like in uh internet explorer. Yeah okay, but does it that is for uh going from four to five. But if you go from two to eight, and you want Yeah, and on two. That you can switch switch easy. Yeah it is. Yeah. Mm no. That's it. Okay. Yeah. Yeah but What I see uh How I see it is you put it on the the remote and then you have like a Windows log-on screen with parents, children. Something like that. And w when you want to use th

e parents uh option, you have to Yeah, ok Yeah. Yeah. Yeah. Pu push parents. That then then then you have to uh go to three-digit uh log-in. Like two one three. And it's in. It automatically goes Yeah. Mm-hmm. Mm yeah. V violent T\_V\_. Yeah, of course. Yeah. Yeah, w It just has to be w when it's deliver out of the store, it has to be just simple and plain. But if you want to install it personally uh If I got kids, and I could choose between uh two remote controls. One uh w with parent control and one without, and I would would buy the one with. I th Yeah. Yeah. Yeah but yeah but that isn't possible. Yeah. Hmm. Yeah. Yeah, and And and you know w uh when you install another device, uh children can still go up to the T\_V\_, p pop open uh the thing and and and g go to a channel. Yeah, yeah of course. But Yeah. Ah it's Yeah. Yeah, okay. But it's just an an added feature feature. Mm yeah. Yeah, like f voice recognition is too much, I think. But games. It doesn't Yeah. That that doesn't c that doesn't co Yeah, that that doesn't cost a lot of extra resources, I think. Yeah, it's it's in it. But too ma I I think so, but Yeah. To put Yeah, to put it in always. Yeah, but T\_V\_s aren't capable of sending. Yeah? I thought they were just a able to receive. Yeah, some. But Yeah. Yeah, j just some rules. Yeah, okay. But, on the T\_V\_ at least my T\_V\_, is a is a compartment which you can press. And there are buttons uh behind it which you can use, if you d if you don't if you don't have a Yeah. Yeah. Yeah, of course. Yeah. Or j Yeah. Ah I have to uh consult my legal advisor about it. Consensus. Oh. Oh. I I have one thing left. Maybe for uh Jerome. Um, the views. Maybe it's uh handy to build in an expert view and a simple view. Yeah. Like at In the experts view, you have a lot of more buttons. Yeah. Mm yeah, okay. Fairly enough. Yeah. Yeah, wh which buttons you like or not. Yeah. Yeah. Just leave the other numbers away. Okay. Go on. A little chat. Marketing. Management. Yeah, that's my function, to Okay. Go on. How I know a marketing name for our product. R\_ th R\_ to the third power. R\_ three. Real Reaction remote. Mm-hmm? Bling. Yeah. Yeah, okay, but it has to be like a split second, because you have to put in a code also and Yeah. Yeah. That spins around like all the time. It it's just like a uh globe in Internet Explorer. Okay. Who uh Who who gave you the master class? Ronald Betenberg? Okay, thanks. Ah. In the master class. Yeah. Me too. Thank you too, lord. 'Kay guys, lot of success. Hello. Um, Project Manager, I have something to tell you. I have a little problems with my laptop. And uh s s s so I had a little less time to complete. No, a little problem, uh big problem. I just thought Um, it didn't work anymore. The entire Windows uh It it hung. During lunch, yeah. He's the master, yeah. Wow. Oh, have you considered the option of using a solar panel? W nah. Mm. Yeah. Yeah. Yeah. Okay. Yeah. Th th yeah. Yeah. Yeah. Um Yeah. Um, I think you should use kinetic as a back-up. A combination, yeah. Okay. Yeah. Psycho-kinetic. Yeah. Buy a fifty cents battery and uh Well maybe I have something in my presentation to uh to cope with that. Um, isn't possible to make combination with kind of rubber is or bendable remotes where you've got a. Or do you think it Rubber casing, yeah. Yeah. Um, well d Maybe I can ask it right now the question that I have. Uh, is it possible uh of is it necessary to make a touch-screen square? It isn't, I think, yeah? We're We put fashion in electronics, so maybe we can uh Mm yeah. Mm-hmm. Oh, yeah. Okay, I I get it. Okay. That's good. Well, as long a as long as it's it's uh it's firm, and you don't uh it's not bendable or something, I th I think that goes too far. Oh. Okay. It might even bounce back when you drop it on the floor. Okay. Do your thing. Spongeball. It'll float. Tables. Ah. Hey. Twelve fifty uh When your parents are watching some boring program, you can take the remote and do something else. Take it. Ooh. S Mm-hmm

. In Okay. Um the interface contents. Well that's a just simple PowerPoint mock-up I want to m make it more as dynamic for you so I'll draw there. But, the main concept is um take one big touch screen. Um, always display the primary buttons clear and visible. Maybe even li like this with uh u uses of a lot of space. And uh make the menu structure changeable. So if you press um system, that's Yeah, well m

multiple system options can, maybe five or ten or or one, can fit in. Or maybe even a step further when you want to um t um have some other options that are not programmable with one horizontal button. And um other buttons can may be displayed here if that's necessary. And um well, how do uh do we want to look at uh uh f um Yeah Does a remote look Well, it's you've gotta hold it in one hand. So um the middle like all remotes have to be in a little bit small, so you can put it in inside your hands. And some remotes you can use with your thumb. But I think that's too difficult for this one. So you can make it s a little broader. Yeah. And here? And maybe use your thumb on the on the main buttons. And use your other hands on the menu structure. So here are gonna be the program buttons. One, two, three, four, et cetera. And the the volume control and program control maybe. And, down here, um, I added, this could be one uh big L\_C\_D\_. Um, the menu structure. So you can use it in uh in this way. Um One thing you've gotta keep in mind, keep the remote clear of too much functions at the same time. Um, know that if you are changing the menu structure here, um And well, I still believe you should keep displaying the buttons. But if you're programming the colour of the T\_V\_, do not display twenty other options that are possible. Just keep it as simple as uh as possible. And do not use too many levels. Do not have to select a screen first and then brightness and then colour and un-plus, and um push plus twenty times. But just the um uh just in one button if possible. And um, well, you kn you all know the T\_V\_ levels. Um, channel one, two. And when you get to n to uh to ten, ye and want to go back, uh well you have a problem. Just m most most modern T\_V\_s, you you press one zero, and it goes to ten. And else, to one and through after that. So the s a button less. And um, things like teletext, put them in the menu. Things like um um Yeah. Yeah, yeah w Yeah, I I find I must trying to uh tell it. Is uh volume plus and minus? And this is program uh plus and minus. Uh Yes. Or if you're watching Studio Sports on uh on seventeen, and your wife is watching some soap on two Well yes, I think that's a good idea. But um, well m my preference would to be put it in the menu structure. And if you're using that button a lot of times, well of course the menu will still be displayed on the screen. You just don't have to play games uh in-between. But if you're really switching between two channels, you won't have time uh to d use the other options. Um, yeah already already told that. Yeah. That's my conclusion. Well, I agree, just put it in the menu structure somewhere. Um, yeah um system properties, um parental control. Yeah. Mm. Um, w well, yeah. It it has to be fast. You don't want to to go down and watch the news at eight o'clock and turn it on and wait twenty seconds for for uh the log-on screen and then remember your code and all kinds of settings. Mm-hmm. Why Mm-hmm. You c may use like when there's uh X\_P\_, uh a simple log-on, d you just push uh one or two or three. And if you push parents, then Yeah. To log in. Yeah. And if you puts a ye Uh-huh. And if you w you push p children, uh you don't have to uh log in, but you can only watch uh children's channels or uh Okay. Well Yeah. Well, maybe um some idea on that. Just make through a remote as it is, but make an option to insert profiles, 'cause if my grandad would buy this remote, he wouldn't want to bother with all all the all the uh things to do. Just make it an option in menu, ins install powerful

profiles or something. Um, b well, still some question I have about how to incorporate those ones. You're thinking about some channels they uh cannot see, but well, I I when I think, oh yeah, for the f for all the standard channels, and only for maybe after ten o'clock uh in the evening violent films and movies uh will come and uh maybe maybe some some timing uh will be uh needed instead of uh of channels, because if you're watching uh, I don't know, you're in the at day uh, cartoons will come up m on maybe Friday night. I don't know. Yeah, the disadvantage vantage is that someone will has to send all the show-view numbers of the programs that they remotes and edit it all, will have to decide uh That isn't possible. Well, yeah you could say if parental control is only it'll go from fourteen to sixteen with

the page-up then, but Mm-hmm. Yeah, on a separate menu uh option. Yeah, well yeah, I A mail too from management that it's very popular to use voice recon recognition. But I don't think when you're watching T\_V\_ uh, hearing loud noises from the T\_V\_, someone screaming one, and you f the channel switches, uh Yeah. Yeah. W you can put it on chip anyway, so uh As long as it's isn't a primary feature of the remote, but uh Optional in But how we do it? Well, I think also it's a good idea, but very difficult to incorporate. So we should make it too complex. Is t some menu uh function, you choose parental control, and maybe four files will emerge from menu where put it on. But uh how how it's gonna work uh uh will f be a problem. Mm-hmm. Well Ye I I think best would be uh to put it in and make it an menu option. You can put on Yeah. And you can just uh s when you buy it, you can select um personal preference, parental control on, and the password or something. Oh, it's a p Yeah. Well, maybe you just have to restrict it to what programs, where the parent says, you cannot watch channel seven, nine, and ten, and you cannot watch all channels after ten o'clock. And there's just some little uh clock in the remote. No, no, it's very simple. There uh th I h I've seen some of remotes who have a clock in it. So, the remote does doesn't transmit when it's after twelve clock. Yeah? Yeah. Yeah. Well, that's To put it very blunt, that's not our problem. Just have um the parents buy uh some glue and uh It's not not a part of the remote. You have to f Yeah. Uh, or make it ourselves very diffic Yeah. Yeah. Okay. Okay. Oh. Yeah? I'm listening. Um, well What I was thinking about is just a menu structure, when you don't use it is simple. And when you push uh system properties, uh entire list pops up with e ev all kind of f stuff you can program. Som some bench-marker. Oh. Uh, logo. Yeah? Yeah. Yeah. Well, you can show somebody a logo for point five seconds, they'll still remember it. And it it I linger on every time you see it. Very annoying. Yeah. Yeah, I It's ok For f Oh, for the next meeting, right? Um Stay here and P\_. Ah, no new email. Okay. Thank you. Thank you very much. Yeah. Uh-huh. See you. Yeah. Here? Or uh Yeah. If you got a No. So Stupid manager. No. Don't get what's Hello again. Mm yeah. Okay. Okay. Yes. Yes. Your project manager. Welcome to the conceptual design meeting for Real Reaction. Uh, hello again. Uh it's uh the same as the last time. Uh uh, also this time there will be uh three presentations. And we um must uh reach a decision on uh the remote control concepts. Um uh, and at the end, uh I uh, when I finish it off I have some uh input from uh a master class I uh visited. information. The the the the the concepts on uh we uh where we uh must reach a decision on. Um uh, our from uh are of two sorts. Components concepts and user interface concepts. Uh, the first one is uh really about the the the the the total package uh with uh Well, we have decided to do a do the uh with a touch-screen that must be a case around it so uh it won't be uh uh as breakable. Uh how how about the energy? Can you uh can you reload it or uh just have

batteries which you must exchange? Uh, the user interface concept. Uh, with the type and uh the the supplements. So uh where to put what button. And uh uh I would say uh Jans, can you begin? Okay. At the end, uh I will take notes uh and at the end of the minutes uh will uh be at the shared folder. Mm-hmm. One one little question. Um about the the material. Uh a soft material for a remote control? Okay. Yeah. Thank you. Mm-hmm. Oh. But you prefer kinetic? Okay. Yeah, but you don't move a a remote control too much. And that's enough to to keep the energy level uh Okay. Okay. Thank you, Tim. Yeah. Dynamic dynamic look? A little artistic. Okay. It's soft. That's the material the younger people want uh, ain't it? Just like the watch from Seiko. Yeah. I I uh I would prefer uh both uh too. Yeah. Combine them. Rubber. Yeah. Yeah. Mm yeah. Me too. Yeah? Okay. Mm yeah. Thank you. Yeah. Do your thing, Tim. Bring it on. Yeah. Flashy. Yeah. Yeah, but wood is not a not a material you which you build a a remote control of. Yeah but never seen one. Case. Oh, a wooden look, yeah. Okay. Yeah. Yeah. Would you prefer uh uh that you can choose the colour of your uh remote control or Okay. Okay.

Yeah. Okay. Maybe you could use your remote as a phone. There are numbers on it, so uh So that you say um S\_P\_S\_S\_, and it goes to uh Okay. Yeah, but you don't use that th games when you watching television, I think. Yeah, okay. You take your remote control with you. Uh great. Oh, okay. Uh I think we can discuss a little about the the three uh kind of revolutionary things uh Tim uh came with. The parental control, the games, and the voice recognition. Uh There's n not uh too much decision on uh that one so uh I think that parental control is a good function to uh to put in the remote. I don't know how you think about it. Yeah. Yeah. No but I think most people uh find it uh much more important that their children don't watch uh sex or violence uh on the television, and uh wait uh ten or fifteen seconds longer, so they can uh finally watch it uh because of that. Uh Yeah. Yeah. Yeah. Yeah. Well I think that's a b there's a big market for it, because uh you Yeah, you read many times in magazines same kind of stuff, and you heard on the news that uh that he Yeah, they believe that children uh are influenced by the television, and uh Well, we're we're aiming uh to uh below uh forty uh years. But there are a lot of uh people will below forty who have uh children in young age uh who who want um to uh not watch uh violent or uh Yeah. Yeah. Yeah. Yeah yeah. That's a that's a better idea? Yeah. Yeah, okay. Yeah, with and one without. Yeah. Yeah, maybe it can work with show view. Uh, you you can control your video recorder with show view. Uh, when you tick in a number, it will uh start and end uh recording. But maybe there's some option that uh that t uh the kind of show view numbers are violent, and that they are blocked out. Yeah. That's true. Yeah. Yeah. I wouldn't put it in an optional device. That that then then then it becomes too much, I think. If we do it, we we must do it in a kind of ways that like a profile, a parent profile, and a family profile, and otherwise. Yeah. Yeah. Okay. And what do you uh guys think of the games in the voice recognition? I personally think that that becomes too much. It's more like it gets you to the functionality, but Yeah. Yeah. Yeah. Okay. And games? That would Okay. So that will uh that that that must be in it, you think? Okay. So the games uh are in it. The voice recognition are not. And the parental control are optional? Yeah. Okay. Yeah, okay. Uh, but uh will there uh uh Like the first idea uh from uh You can buy it without and uh with parental contr control? Or are we going to put it in and uh just uh Yeah? Mm yeah. Yeah, you yo Yeah, but most often not. Yeah. Okay. So uh I think we have decided on the things that Uh from Janus, the energy, the combination between battery and kinetic. The case will be double-curved and uh r

ubber, in a fr flashy fruity colour uh that with cover is removable. The buttons will be uh touch-screen. Uh but there may not be too many buttons. And in the the menu structure, uh there must not to be uh Five minutes to go. Uh, too uh too many levels. And uh it must be easy to use. The parental control will be incorporated, but it must be not too complex. And the games are in it. So I think we have uh we have decided uh, okay. Uh, little more. Yeah. Like a like a moat or s or something. Yeah. Yeah, but you have that in the Yeah. You use the Yeah. It's already incorporated a little in that concept. Okay. We take it to the other meeting, okay? I have a little w uh little chat to do and uh then we uh finish. I went to uh a master class and uh uh two things uh are uh are uh can come in handy uh for us. First thing uh is uh we talked about knowledge uh management. Knowledge engineering and uh uh the fact that uh that uh that the idea of knowledge, uh sharing and learning knowledge from other companies is uh like that. It's it's uh very hot at the moment, so it's it's mostly for the management expert to to look what other uh marketing or did I said management? Oh. Just talking about myself. Uh W What other companies uh had to uh also with the the the the marketing campaign when they put on a newer remote, just some uh Yeah. Import export. And uh another one. Uh, they're a ha they're at Yeah, benchmarking, that's the word I saw. I uh couldn't uh Okay, uh another uh thing is uh there were there there was a survey, and um uh it came out that um people like to buy things from a single large provider, instead of those who

uh are partnering uh with us. So, we must uh we must bring it as if uh Real Reaction is uh is big company, uh a trustful company, and uh it has m Okay. I had a I had another idea to put uh uh the whole the whole idea of uh Real Reaction and uh uh uh a single brand and uh uh that kind of thing. When you uh put on remote, you see a kind of a just like when you telephone, you see a little uh animation. Real Reaction remote. And uh with the with the with the motto, we put fashion in electronics. And then you go uh The Yeah. But w th the idea from this uh thing is that we must present it as a as we are a a single large provider who will stand on our own. Mm yep, yeah. Also also. But we we are uh Yeah yeah y yeah yeah. Okay, but uh think about that kind of things. That's what they said in the master class.. N Uh, next meeting starts in thirty minutes. So uh maybe you can go to Paris and Milan uh once again. The master class? Franz Mehler's. Uh, very special, uh next uh session. Uh idea that you uh the the industrial uh development uh centre and uh user interface uh will work together on a prototype. And uh will drawing it on the SMARTboard. So that's a kinda new uh thing. And um, the marketing expert will uh will uh ke he will be keeping busy with the product uh evaluation. But the most uh specific instructions will be sent to you by email. Yeah, the well, uh dids this what I uh what I heard. I Not in the master class. So you uh just wait for the specific instructions and uh But I think it was a very uh very good uh session, uh gentlemen. I will thank you all. And uh Give me a good evaluation. Cheers. See you in a half hour. But keep an eye on your uh laptops for a real uh Yeah, but th there's there's still the my uh instructions that you will work together. That's not my problem. Bye-bye. The project manager always works alone.

## Executive Summary

The group introduced themselves and their roles to each other. The Project Manager introduced the project aim and agenda to the group. The group acquainted themselves with the meeting-room equipment by drawing on the whiteboard. The Project Manager discussed the projected production cost and price point for the device. The group began a discussion about their own experiences with using remote controls and about usability features to be included in the design. The Project Manager instructed the Industrial Designer to prepare the working design, the User Interface Designer to research technical functions, and the Marketing Expert to prepare the user requirement specification. The group discussed the function of the prototype and decided that they should restrict the remote to television for the time being.

## Complete Meeting Transcript

Mm-hmm. Yeah. I'm Robin. I'm the Marketing Manager. Mm-hmm, okay. I dunno. Your microphone's just Yeah. I don't know. We can have have a whole menagerie. Right. Hello. Um I'm gonna go for the dog, and I'm gonna draw one badly as well. Uh. looks like it's going to be a dachshund or something. Right. There's my dog. Um I like dogs because they're very loyal. And they're always happy, so whenever whenever you're feeling sort of a bit a bit down or tired, they're always coming up and they're always um quite excited. So um you can always have a lot of fun with a dog. And they're also good for exercise as well. You can sorta get out and they they sorta never get tired. And and when they're tired they're quite cute as well, so. Okay, that's why I like dogs. Great. Mm-hmm. Yeah. Mm. Yeah. I've Okay. Yeah. Um one of the things um we found from the market research is that people often get confused by the number of buttons on them as well. 'Cause there's quite often lots and lots. And um sometimes uh they sort of remote controls defeat their own purpose because you're sat in the chair and the remote is somewhere else in the room. So whereas in the past you'd have to get up to change the channel, now you have to get up to sort of pick up the remote. So so I don't we need to sort of maybe think about how um we could maybe uh develop a remote control which moves around the room. I don't know. That's that's maybe something for the future when you can talk to your television, but Yeah.

Yeah. Mm-hmm. Mm-hmm. Yeah. I mean we've done some research um about sort of you know what the cutting edge sort of hand held devices are, and a lot of them sort of use you know they're like they're like mini laptops. So it's possible that we could devise a system where where you're you're basically sort of holding a a miniature computer which is controlling all your your sort of your television, your stereo, and where you know if you buy a new thing then it sort of you can link it to that as well, maybe. Okay. If you just click return it should be okay. It'll get rid of the message. If you hit just hit return and it should get rid of the message. Oh you've got. Yeah. Yeah. Mm-hmm. Mm-hmm. Okay cool. Okay cheers. Okay. I'm Nick. I am the Industrial Designer. Tool training. Yeah. Yes. Okay. You've lost uh your microphone there. Okay, yeah. I'll I'll Shall I see if I can get across without just tangling everything. Okay. There's one. Didn't think of that. 'Kay uh pens are over here. I'll try the red pen. Okay. Um. I'm gonna go for the bear which I'm be able to draw very well, but I'll have a bash at it. Uh. Ooh ooh I lost it there. I think I've just knocked the microphone. Um. We'll g then we'll go for a a s small small bear. Um and I like my animal that looks nothing like a bear because um I dunno maybe because there's so many cartoon characters made up after the bear like the jungle book characters and stuff like that. Great. Yes. Um I with some remote controls the buttons were a little small so they're quite hard to press so maybe we make something with uh easy to press buttons. As that is the main function. Yes. Um sort of easy to use so the buttons are accessible. is easy to use and see. Yes. Sorry, you go. You go. Yeah. Yes. Yeah. Maybe we could um have better instructions with the remote. Or are we just doing the design of the remote control itself, or sort of the instructions that would come with it? 'Kay. Or not. slide four Okay. Yes. 'Kay, yes. I think you just said at the start it was a television remote control, so maybe we should just stick to that unless we get told otherwise. 'Kay. Okay, that's great. I'm Louisa. I'm the User Interface Designer. I'm not exactly sure what you mean by tool training. I don't mind. Um. Let's see. Good job I got pockets today. Are we supposed to do this right now, do you think, or? Oh. Right here we go. Okay. I think that I would have to say that my favourite animal is the cat. Little smiley cat there. Um and this would

be because they're very independent, uh they're very intelligent, compared to dogs maybe. Um and they can be very very affectionate. Some people don't think so but I know very affectionate cats. Um. Um and they can look after themselves. Shall I rub that out, actually? That's quite good. Can I just check? Is this just a television remote? Because a lot of um systems are kind of T\_V\_ video combined now, or T\_V\_ D\_V\_D\_ combined. And one of the most annoying things is having like five remotes in the house. So if you've got a combined system, it could be a combined remote. Or is it just a television that we're supposed to be doing? Comes to your whistle. I think that might be back to the start. Um if you grab the kind of uh slide to the left and pull it down? I'm not exactly clear on what we're designing the rem remote for. Is this a mun multi-functional one or do we decide that ourselves as we go away and work on it? Right. Okay. Right, so start of the first meeting. Uh. Right, so agenda of the first meeting. Where we uh We have twenty five minutes for this meeting. We uh are to get acquainted. So does everyone want to say who they are? that seem sensible? And I'm Alastair and I'm the project leader. Alright okay, so tool training. Um. Project plan. So does anyone have any uh thoughts as to the tool training that uh is required? Neither am I. Oh I see, so we shouldn't really be Oh right okay, so. So we have the project team, which is to um basically to come up with a new r remote control device. Uh we have uh the starting base was the original which has been in existence now for a period of time. And uh our idea is to uh to make the new remote control device uh more user friendly than the previous one, and to to be trendier, to be with it, and therefore to uh to get a bigger market share and bigger audience. So um method of doing this is uh split up as you can see into uh the functional design, the

conceptional design, and the detailed design. So um in each of these uh phases we'll uh basically be handing over to yourselves, the designers of this uh this device. And uh having uh meetings so that we can uh during the course of the day um come up with a better better inst implement than we had before. And therefore um have a successful uh conclusion to the day. Um and you'll be doing uh various designs uh throughout the day to meet this end. So we've got tool training. Try out whiteboard. Uh. So we will um. Right so everyone's to uh supposedly uh draw their favourite animal over on the white board over there. I guess this is uh make sure the whiteboard works. So uh I don't know who wishes to go first. Do you wish to go f Have a first bash at uh whatever. Ah uh. But now you you uh you'll move out from the microphone and the camera. I take it that I would I would guess so. Or Technical problems. I mean you designers are meant to come up with these sort of things. Next. I don't see as there's any need to. There's plenty of space. I mean whatever. Exactly. We've had more time to prepare over this side, so we've all stuck our bits and pieces in our pockets. The three pens are underneath. You get marks for artistic impression. So you're just doing the face. Right, um. Well I've not actually had too many pets uh over my uh time 'cause to be honest with you uh I'm not too keen on them anyway. Not to worry. So what my daughters have got at the moment is they've got uh a few fish and so hopefully um won't prove too difficult to draw. Uh As you can see that my artist artistic work is useless as well. Anyway um. And uh one of the best uh things about fish is that they don't really take uh too much looking after because uh with most of the animals if you're going away on holiday or whatever, you've gotta spend money or get a friend or whatever to look after them for you. Whereas if you got fish, you just gotta put the food in a a a dripper feed which feeds them over the uh couple of weeks that you're away and uh change the water every couple o

f months, and buy in a few plants, so. Other than the fact that they keep dying, uh fish are uh are not are are are reasonable pets in that uh they're low maintenance. Right. Okay, uh if we're still all with us. Right okay, so. Work has been done on uh this uh project where by um twenty five Euros is uh the uh expected uh selling price. That information has come from our marketing manager here. So we're looking to sell internationally, not just in Europe. We're looking at um having our production costs limited to uh twelve and an half Euro per unit. And therefore making a profit margin of uh well not actually a profit margin it's uh because obviously you're gonna have overheads and various other costs to uh take uh from uh from that to give you your profit margin per unit. And so depending what the uh the overhead uh costs are will determine uh how many units we're uh looking to sell or projecting to sell at this point in time. So um Experience with remote control, first ideas. New remote. So I guess we're looking at um having a discussion at this point in time to help uh you um folks design our our new model as it were. So uh any any thoughts? Okay, so so basically we're looking for some um we're looking for a device that is um robust and and therefore uh won't get damaged too easily. Um we're looking for a device that is uh What was the other things you said there? Easy to use. Use. And see. Okay. Uh. Mm-hmm. Oh I w um basically I'll get back to you on that. But it seems to me sensible, 'cause as you rightly said, there's nothing more annoying than having three or four devices littered about the uh about the room. And uh So a device for for all remotes. Hmm. But is it in a sense it's r um mutually exclusive. You can't have both the th the one device and then have few buttons on it to 'cause you want you want simplicity as well, you want any idiot to be able to use it. Whilst at the same time you want, as you rightly said, one remote for all. And so these are probably mutually exclusive options that uh Hmm you could argue that experience of using devices and similar devices as people get more and more used to using remotes, therefore they're more with handling them, therefore you can make them more complicated as time goes on. Better instructions. Mm-hmm. Okay. Um well we've got five minutes

before the end of the meeting. So uh we have to uh start winding up. Um is there Next meeting in thirty minutes. So um Right, so we've got I\_D\_ the Come on, where's my Oh there we go. Yeah. That's what I was looking for. Right. So we've got function Oh what happened to the Right. Right. Sorry about that. Okay, so we've got um the working design for I\_D\_. For U\_I\_D\_ the technical functions design. Marketing, the user requirement specification. Specific instructions will be sent to you by your person by your personal coach. So. Are we all clear what objectives we're looking to meet in the next thirty minutes? And I guess I'll try and write up some minutes of uh this meeting to uh to give it to you for the next meeting. Television remote control. That's true, 'cause during during the course of our day we might make decisions based on information or meetings that would change where we're going. But at this point in time I think you're right that uh shall we make it just a T\_V\_. Okay? So we will depart. We will stay here and uh and break off. And I'll do minutes and and we'll see you in half and hour. Okay. Right s

---

# Meeting ID: 93

Data Source: Train

## Executive Summary

let's get started . Uh opening acquaintance , tool training , uh how to use the things here . Uh project plan discussion , and yeah then the rest of the meeting . Um we're supposed to develop a new remote control , that's both original , trendy and user-friendly . Um we're work we're working uh from top to bottom . Uh functional design , then we do some in individual work , then we have a meeting to discuss the results , etcetera etcetera . And at the end of the day we should have a prototype drawn up . Uh we have available the smart board and the whiteboard . Um uh we should take some practice . I have some instructions now to do that . you know how to the documents work . Uh this for toolbar . You see it next . Um And we can use this pen to perform . It doesn't always work . and in the format menu you can select colour and line width , etcetera etcetera . Each of you can uh take some practice and you should draw an animal . Uh you should explain Uh with different colours and with different pen widths . And you should explain why you draw that particular animal . Different pen widths , how do you do that ? Uh with the format menu . And use different colours etcetera . It's a giraffe . Yeah . Can you use one blank sheet per drawing ? Or you can press the next button , I in the file option menu . Is this part of our a acquai or introduction to each other ? introduction and get acquainted I'm guessing a turtle . How to select the next or Colours were under format A fox yeah . It's a cat . we have a financial aspect to this project . Um we can sell them at twenty five Euros . Uh the aim is to reach uh uh to sell as much as fifty million Euros . Uh that's quite a big amount of money . And the production cost should be the half of the selling price . now it's time for some discussion . Uh I'm taking notes . Um we each have a specific task , I didn't know if you received the same mail . as I saw in my mail . this industrati Industrial Designer should produce a working design . Uh the User Interface Designer should specify the technical functions . And the Marketing uh Expert should come up with user requirements . Uh did any of you already do some work on this part I started making an overview for myself , um what I had to do , and in every step I have a s specific task to perform or whatever . 'cause we have three design steps And do you have any ideas about the product uh so far ? I started I started with the first phase , I had to focus on the working design , which you said . I basically had two points . Uh according to the coffee uh machine example , I have batteries to supply energy , and we ye use button presses to activate or deactivate certain functions on the T\_V\_ . I got another point . It uses infrared light to communicate the signal to the T\_V\_ apparatus or stereo . Uh it's uh some buttons for for the on off function . And for the changing up to the to all the

channels and changing the volume . That are the the basic options for a remote control . I mean , you wanna ch ch flip the channel but you might wanna use teletext also . Uh and what did the Marketing Expert do ? from a marketing uh perspective , um well the function design phase uh consists out of the user requirements . Um what needs and desires are to be fulfilled ? there are a few means to reach that um by by doing research uh to see what existing products are there out in the market . I mean , what functions do they have . Um especially what are their shortcomings ? Are there any new functions uh which can be added to our product ? Um therefore we have to to do some internet search . For example for um well what kind of applications do current remote controls support , and what are f featur features of uh current and future televisions ? Um and we can interview current users and future users . What w what would they like to see uh on a new remote control ? Um especially for future users , uh I'm thinking of early adopters , because they they use new technology first , Um but have you any idea so far as what uh the user requirements are ? No n not specifically . I got some uh requirements it has uh it has to be user-friendly . Uh really easy to use buttons , not not uh very small buttons , but not the the also the big big buttons , It has to be a small unit . you can take it with you uh everywhere in in your house . Uh and a and a good uh zapping range . Uh the distance uh from your television to your uh remote control has to be , uh yeah um yeah , quite a big distance . I don't think I have anything more to add at the moment . I think we can go ahead with what we have . I will summarise the things we discussed and put it in the project folder . Uh the use of the Industrial Designer can work on the working design , etcetera etcetera . And it seems you get more information by email . I'm just a bit wondering what we're gonna do the next uh session ? Do we only have to to do uh phase one , the functional design uh ? After that we are going to the conceptual uh Y you do some individual work , we have meeting , individual work , meeting . And at the end of the day we have a final meeting . I mean , is it gonna be a multimedia control centre ? Do we want to be able to use the video recorder with it ? I think that is the user requirements part . As to what they want . Uh do they want all those functions on that small But but we need good communication about this stuff , So if I don't know what components to put in , it's kind of hard . I I think we have first to start with the basic functions and we can uh expand them . like I li like some like some some remotes who are out there , which I know , there's one button which is very easy to switch between devices . So you can switch to your video and then the same buttons control your video . And another function I'll think of switch to your media centre , but you'll ne need several other buttons for a video player . You need a play and a forw fast forward and a stop function . And you you don't need that for a T\_V\_ . And and for a t uh teletext you need additional buttons as well , so I kind of need to know what we uh need . and then we can discuss it with the next uh meeting . We could just start with the assumption that's only for T\_V\_ and video . And um reserve the possibility to add other features . So we have a basic starting point so make sure it's extendible . Yeah . and you can always extend that it it has yeah it has to be user-friendly . Th the least amount of functions possible and uh I'll see you again uh when the computer tells us to . Let's see what we got to do .

## Complete Meeting Transcript

We're the first. Marketing Expert, yes. Yes. Bling bling. Yeah. Right. Uh where has my screen gone? Hmm. Yeah. My screen is gone. Oh. Yeah. Yeah. Very nice. Yeah. Mm. Yeah. Yeah. Draw. Alright. 'Kay. Don't take up too much space. Should it be one Giraffe's yellow. Can you use one blank sheet per drawing? Or so y you must save it at the end and then Okay, then m make a new one. It's more like a dinosaur. Uh. Some leaf to eat. Yeah. Thanks. Yeah. Uh Yeah. Alright. It's not that fast. Yeah. I see. It misses the spot. I say good guess. Uh Because it's slow. Yeah I was a bit slow too. So Uh some other line uh width uh No. I dunno. Does it have legs? Yeah? It's more like a tank. Yeah that's fins but I don't know where. Some spots. Ah some eye. Yeah that's a fr friendly turtle I guess. Yeah well I think it's uh fair enough. Right. I don't know what the position is. Does it have ears? No. Oh okay. Can you erase ears or Yeah? Alright. Eraser. So I dunno. I it just came into my mind. So there's no particular reason I pen. Yeah. Well I'm guess I'm done. That's my turtle. How to select the next or here. Yeah. Here you go. A fox yeah. Firefox. A cat who had an accident or Yeah. Okay. Great. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah. So that's very common. Yeah. Yeah. Uh well from a marketing uh perspective, um well the function des design phase uh consists out of the user requirements. Um what needs and desires are to be fulfilled? So there are a few means to reach that um by by doing research uh to see what existing products are there out in the market. I mean, what functions do they have. Um especially what are their shortcomings? Are there any new functions uh which can be added to our product? Um therefore we have to to do some internet search. For example for um well what kind of applications do current remote controls support, and what are f featur features of uh current and future televisions? So we can see uh what needs to be supported. Um and we can interview current users and future users. What w what would they like to see uh on a new remote control? Um especially for future users, uh I'm thinking of early adopters, because they they use new technology first, and they play with a lot of tools and stuff so maybe they have some good ideas to uh to add. I think I can get that information, yeah. So yeah. No n not specifically. More to how to get them and Yeah? Yeah. Yeah. Yeah. Yeah. From the other end of the room or something? Yeah. Any more points to discuss? Alright. 'Kay. Thanks. Yeah. The pro okay. Yeah. Okay. Uh. I guess so. Yeah. We're just working the three phases. Okay. Better make it Yeah. That is my question also because like new new functions Requirements. Yeah. Yeah. Unit. Yeah. Yeah well I I was Yeah well like I li like some like some some remotes who are out there, which I know, there's one button which is very easy to switch between devices. So you can switch to your video and then the same buttons control your video. And another function I'll think of switch to your media centre, because that's getting very popular. And then use your Windows media centre under your T\_V\_ with the same remote control. So with the switch, one single switch S Yeah records and stuff like that. No. Yeah. Yeah. In the project uh Yeah. Yeah. Yeah. Yes. Half an hour. You're fired. No. Alright let's move on. Yeah. Yeah see you later. Well good luck. Hi. Oh yeah, we have to talk in English, huh. I'm afraid I'm a bit slow for this stuff uh. I'm afraid I'm a bit too slow. I don't know how much preparation you guys did, but not a lot. Mm-hmm. Not yet. Operations. Different pen widths, how do you do that? Oh okay. Are you serious? I in the file option menu. How much time do we have to draw anyway? 'Cause I can take forever on this. Is this part of our a acquai or introduction to each other? Alright. Uh. Your line broke. I'm guessing a turtle. No. I'm kidding. Because of its shell. Dude you're a good drawer. Do you have a turtle pet? Uh okay. Yeah yeah ye

ah. Stumpy stuff. They kind of I look like mole legs. With sharp nails on. A little tail maybe. Uh no. The little holes maybe. And why did you choose this animal? Alright. Alright. Colours were under format right? Let's see. How am I gonna do this? Um Mm uh. Not quite actually. No. Aye. It's a cat. Not quite yet through. Uh yeah I dunno. They're my favourite pets. Uh I have colour already. Yeah I'm not so

good at drawing with this kind of st Oh shit. Um Excuse my language. I don't know how to draw its face. But you get the idea. It's a cat. It's my favourite uh pet animal, 'cause they're cute, they're independent and cuddly, I dunno. That's it. Or do I need to use more colours and Alright. Yeah. So we have to s Yeah. Mm-hmm. I guess so. Yeah. True. Well I started making an overview for myself, um what I had to do, 'cause we have three design steps and in every step I have a s specific task to perform or whatever. So I had to uh, I dunno, make an overview for myself about what I have to do, and kind of let it work in to get ideas about well how I have to fill it. Well I started I started with the first phase, I think was the functional. And uh let's see I had to focus on the working design, which you said. How does the apparatus work? And well I basically had two points. Uh according to the coffee uh machine example, I have batteries to supply energy, and we ye use button presses to activate or deactivate certain functions on the T\_V\_. And that's basically all I have so far. Alright. Yeah. Yeah. Yeah I kept it global 'cause that it activates or deactivates specific functions, 'cause I wasn't thinking yet about that. I mean, you wanna ch ch flip the channel but you might wanna use teletext also. I dunno what the word is in English. Uh Yeah. Obviously. Whoa. Is that you or alright. Alright. Alright. Well no I'm just a bit wondering what we're gonna do the next uh session? Yeah okay. We'll do our best. I am gonna work on the conceptual design already 'cause yeah it's fairly important to know what kind of components we want to put in. Do we I mean, is it gonna be a multimedia control centre? Do we want to be able to use the video recorder with it? Yeah. True. But but we need good communication about this stuff, 'cause I have to f put the components into the design. So if I don't know what components to put in, it's kind of hard. Yeah so Okay. Yeah I I know what you mean, but you'll ne need several other buttons for a video player. You need a play and a forw fast forward and a stop function. And you you don't need that for a T\_V\_. And and for a t uh teletext you need additional buttons as well, so I kind of need to know what we uh need. Whatever, I'll just put my ideas in uh in here and then we can discuss it with the next uh meeting. Okay. Okay. Alright. Yeah. I understand. Yeah. Alright. Yeah. Thanks. Alright. See you later. What the Mm. So you found your spots. Okay. It's called black. Okay. You see this beautiful presentation. Okay let's get started. Uh I sort of prepared this. Uh opening acquaintance, tool training, uh how to use the things here. Uh project plan discussion, and yeah then the rest of the meeting. Um we're supposed to develop a new remote control, that's both original, trendy and user-friendly. So, hope you have good ideas. I don't. Um we're work we're working uh from top to bottom. Uh functional design, then we do some in individual work, then we have a meeting to discuss the results, etcetera etcetera. And at the end of the day we should have a prototype drawn up. Uh we have available the smart board and the whiteboard. Um uh we should take some practice. I have some instructions now to do that. Uh well you know how to the documents work. So Uh this for toolbar. You see it next. Um we have a pen. And we can use this pen to perform. Yes. So It doesn't always work. Yes. Okay so you can draw. Okay and in the format menu you can select colour and line width, etcetera etcetera. Okay? Uh Okay. Each of you can uh take

some practice and you should draw an animal. Uh you should explain Uh with different colours and with different pen widths. And you should explain why you draw that particular animal. So, Julian. Uh with the format menu. And use different colours etcetera. And what's that supposed to be? Oh yeah. Oh yeah four legs. Uh-huh. Yeah. Yeah you can press the next button, which is uh yeah. I'll show you. Yeah. In file menu. Yeah. Yeah. What is it? A giraffe okay. Yeah I see a long neck but Okay. That's nice of you. Okay. Yeah pretty good. Uh could you press the next uh Okay. Then uh. Yeah sorry, introduction and get acquainted and That's the idea, so Yeah it's a bit slow, so Yeah. pressure. Why a turtle? It's slow. You were slow too so Yeah sure. Yeah not exactly legs but More like fins or Yeah.

Yeah it's I looks very friendly. Yeah okay. No. Yeah yeah yeah. There's a a gum, gum to. He said it was slow. I like it. Okay. Your turn Niels. The next yeah. Makes new paper. Yeah. Orange. Kangaroo. Dog. Cat. It's a cat. Why a cat? You have some uh? The pen, yeah. Sure. Yeah. Alright. Okay. Yeah. I think it's okay. You get idea right? Okay um we have a financial aspect to this project. Um we can sell them at twenty five Euros. Uh the aim is to reach uh uh to sell as much as fifty million Euros. Uh that's quite a big amount of money. And the production cost should be the half of the selling price. Okay now it's time for some discussion. Uh Yeah. We should get started. Uh I'm taking notes. Um we each have a specific task, as I saw in my mail. I didn't know if you received the same mail. Yeah? Okay so the um uh this industrati Industrial Designer should produce a working design. Am I correct? Okay. Uh the User Interface Designer should specify the technical functions. Right? Yeah? And the Marketing uh Expert should come up with user requirements. Uh did any of you already do some work on this part or Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. And do you have any ideas about the product uh so far? Mm-hmm. Mm-hmm. Yeah. Mm-hmm. Okay. Yeah I got another point. It uses infrared light to communicate the signal to the T\_V\_ apparatus or stereo. Same I believe. Uh and what did the Marketing Expert do? Mm-hmm. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Yep. Yes. Okay. Okay. Mm-hmm. Okay. And you can get that information? Okay. That would be very handy. Um but have you any idea so far as what uh the user requirements are? No? No okay. Yeah? Of course. Big, mm-hmm. Uh what do you mean by that? Okay um Well I don't think I have anything more to add at the moment. Um I think the best is to go to work. Yeah. Okay. Yeah. I think we can go ahead with what we have. I will summarise the things we discussed and put it in the project folder. Uh the use of the Industrial Designer can work on the working design, etcetera etcetera. And it seems you get more information by email. So that was it for me. Uh Yeah, in the project folder. Yeah. I'm writing very fast. Hope it's readable. Okay um anything more you want to add to the discussion? Yeah. Because then we have a Yeah. Y you do some individual work, we have meeting, individual work, meeting. And at the end of the day we have a final meeting. And then I have to prepare uh I have to defend our design, so make it good. I depend on you. Yeah? If you can mix it it's okay. Mm-hmm. Yeah. Yeah. Well I think that is the user requirements part. As to what they want. Uh do they want all those functions on that small Yeah. Mm-hmm. Yeah I understand. You can always add a few Yeah. Hmm, the C\_D\_ player. Yeah. Yeah. Okay. Mm-hmm. Okay. You need additional yeah. Yeah. Uh Yeah. Yeah. We could just start with the assumption that's only for T\_V\_ and video. And um reserve the possibility to add other features. So we have a basic starting point and you can always extend that so make sure it's extendible. Yeah. Th the least amount of functions possible so it's easier to get to know how it works etcetera. Yeah? Okay and uh I'll see you again uh when the computer

tells us to. Yeah, you're di dismissed. Not yet. Okay. Let's see what we got to do. Yeah. Yeah. Thank you. Mm uh. Mm. We're the first ones. Move to the meeting room. Okay. Hello, good day. Yep. Kick-off meeting, wow. It's uh looks uh nice. Hmm? Yeah. No, it's it was uh not enough. I did my best. Okay. Um yeah. It's a giraffe. Yeah. Okay. Uh it needs some uh some yellow uh Oh format. That's some spots. No. Okay. Do I have to explain uh why I chose this uh this animal? I think it's a it's a great animal. It's a it's a giraffe. Yeah, that's a Um Okay I'll will give it an uh an eye. Hey. Come on. The next? Yes. Here you go. Hmm. 'Cause it's so 'cause it's green. No. A rabbit I think. Kangaroo. Fox. Mm. Okay. What uh what uh do you want to discuss? Yep. Yep. Yeah. Wireless uh huh. Uh it's uh some buttons for for the on off function. You d you already told that. And for the changing up to the to all the channels and changing the volume. That are the the basic options for a remote control. Okay, yeah. Yeah. Yep. I got some uh requirements it has uh it has to be user-friendly. Uh really easy to use buttons, not not uh very

small buttons, but not the the also the big big buttons, but just normal buttons. It has to be a small unit. It has to be uh yeah, you can take it with you uh everywhere in in your house. So it has n has not to be I yeah, gigantic uh machine. Uh and a and a good uh zapping range. Uh the distance uh from your television to your uh remote control has to be, uh yeah um yeah, quite a big distance. It has to be capable for zapping uh Yeah. Okay. Are you going to put the the notes on the Okay. Yeah. Yep. Yeah. Do we only have to to do uh phase one, the functional design uh? After that we are going to the conceptual uh Okay. I would first m Yeah. I I think we have first to start with the basic functions and we can uh expand them. Yeah. Yeah. Yeah. Yeah it it has yeah it has to be user-friendly. So it's hasn't it's yeah. Yeah. Okay. Yeah. Can we leave now or Mm. Okay. Good luck.

---

# Meeting ID: 95

Data Source: Train

## Executive Summary

this meeting will be about the conceptual design , Um , think of it 's kind of uh turning the abstract into slightly more concrete . apologies for the last meeting , it was brought to my attention that I did not make the roles clear enough , um , so I will attempt to do so more accurately in this particular meeting . basically all we're gonna do is have some presentations again much like last time , um and we'll collate what we know about um what we discussed in the last meeting , possible directions . And then we'll make some more decisions on um basic uh firm up our idea on how we want this remote control to look and work . basically what I'm gonna have to talk to you about today is um component design Basically what I'm gonna be doing is talking to you about that . Um , components of a remote control , okay . We've already kind of gone over this but we're gonna have to get into more detail Energy source , um , our manufacturer offers a variety of energy sources , your standard battery , solar cells . Our manufacturer didn't say anything about lithium if we do go that route , we might have to look elsewhere . Um , and also there's a kinetic energy possibility . Basically , it's like a um the idea of moving the remote would create enough energy to keep it running . but I don't know whether that would be powerful enough to illuminate a touch screen . Um , the case , we have a few options , plastic , rubber or wood . Um and then as far as the way it's shaped , we can do standard boring flat , which we probably don't wanna do , curved or very sexy double curved . What kind of thickness are we looking at ? Um , I imagine that we could specify . Um , the buttons , there are multiple scroll buttons available from our manufacturer , but to use those we'd have to use more chips , And if we do go with the rubber doubled curved case um we'll have to use rubber push buttons because the other buttons aren't compatible with that . touch screen equals many chips which equals many Euro . Um , one thing that I noticed was that most remotes operate on a infrare on the infrared part of the spectrum . So you notice when you push a button on a remote you can't see anything coming out of it but in fact there is light coming out of the remote Uh one thing that I thought might be interesting was to use part use visible light coming out of the remote , just kind of as a fun gimmick . So you could actually see something coming out of the remote when you pushed it . is there an option that we can have that off or on so a person can select like I am sure that we could do that . just as a fun gimmick . Um , and then on to the circuit board that we're gonna use , also known as the chip . Uh , we really don't have any way around the T\_A\_ one one eight three five . we're very limited by what our current manufacturers can offer , um and my question to all of you is , should we

look to other manufacturies or should we just make do with what we have available ? I'd say shop around but with our time constraints , is that really a feasible option ? Um , if we do go the lithium battery route then we'll have to go outside our current manufacturer . My personal preference is uh I think we should probably go the solar battery route , just to kinda keep with the environmentally friendly theme that we have going on . Uh , I like the idea of the visible light signalling , and uh I was thinking about I was thinking of ways that we could produce the remote in a variety of different case materials to suit different tastes . Um , basically I was looking at what's going on in the remote control market right now and what's going on in other design fields , to see sort of what's what's trendy , what's new , what's happening . Um , remote control right now basically everybody says they want newer , fancier , more exciting um that we need innovative design options and there needs to be an easy user interface . Um the challenge is that current trends right now , across the board in fashion , in furniture , in technology , is a very organic fruit and vegetable kind of thing . Now I'm not saying we should have , you know , tomato shaped remote controls or anything , but I think it is possible maybe to use um natural colours , like if wood is an option , that whole organic , sleek , clean , Different skin options , and th apparently the feel of the next couple of years is spongy , though if we can get around to getting piloting , I thought maybe a casing option like uh not like a skin , but like a holder almost if you could do like um , leather options or wood options or something As far as the rubber that we can use we can use a rubber as part of the case , it has a consistency of those stress balls . I think perhaps the double curve thing and maybe this rubber option is our best way to go for right now . but then if the touch screen thing isn't gonna work out for us that's really a non-issue . I like the idea of of rubber too I think that goes against the whole fancy something , a new line , interface concept by your faithful user interface designer . So yur user interface , guys , is basically aspects of a computer system that we can see or hear , or otherwise uh perceive . Uh , commands and mechanisms , that basically user uses to control the operator operating system . Here's a d series of different remote controls that are out on the market today . the following are a bunch of different uh interface uh concepts . Uh voice recognition , we we um actually have some new uh information from our research design team current voice recognition starts up to about eighty speech samples , um and basically you record your own verbal labels c and connect them to the remote control . our design team , research team , has been able to uh set up a system in which uh you can teach the remote control voice c recognition system to respond to um with standard responses . Like you could say good morning uh remote control and it'll say in a sexy female voice , Good morning Joe . Um . Um , another concept is what uh Apple has come up with , the spinning wheel with uh L\_C\_ display like on the uh iPod Um and then we have the scroll button with integrated push-button , kind of like a modern a bit bulky , a bit crazy , I don't think that's we're necessarily going for . And uh some special components , uh ideas like uh blocking , having the ability to block channels from your for your children um and uh dedicated buttons for for commonly used uh channels and even uh ideas like secured or hidden programming but uh I again if we go with touch screen I don't think that's a big issue . Um and uh this is kind of the uh the big daddy of remote controls here . Uh the jumbo universal remote control is almost impossible to misplace or lose . so I I mean my ideas here and kind of where I think we're heading is something slightly larger than a regular iPod uh with a hard cla c uh plastic casing Uh changeable casings uh our design team was possibly talking about including one extra face plate with the package Uh touch screen interface , um possibly having go-to

buttons being uh stuck into the system so those don't move away from the screen , uh , the important ones like power , volume and jump between channels . Um , and of course our voice command system which I've talked a little bit about already and uh the use of recognisable colours and shapes to aid recognition of the features um that are around red for power , um arrows for different volume ups and downs and channels ups and downs and what not . And uh perhaps even adding in some stupid little jokes with the voice recognition idea Now we kind of have to come to some decisions , Based on what Nathan presented as far as the um various costs and benefits um I think , I dunno , what do you guys think about the touch screen at this point ? I think it's our most marketable feature and all three of us can have a chat about it . Um . But can we really afford it My estimate is that in order to incorporate touch screen technology it's gonna cost us upwards of seventeen fifty Euro per remote , that's just an estimate though . it's just , it is a question of and how much ca o does that mean we're gonna have to increase the price to make money . Where do you guys come up with these numbers ? That's just off the top of my head , I mean if you're gonna pay for an expensive high class remote , you're gonna expect it to do something we could probably maybe shrink the profit margins rather than selling for twenty five , sell 'em for thirty , but that's something that we can have finance deal with . Um , I say that we provisionally go with the touch screen and we can look into this other manufacturing option , and maybe we can get 'em somewhere else cheaper . let's let's say that okay so the touch screen will be our um our main selling point here . I mean I think that we really have two main selling points , 'cause with voice recognition I think that our casing and the voice recognition I mean , if if we're looking at bottom line , now we're looking at upping the cost to seventeen to get the touch screen on , I think we might have to drop the voice rec . I think we'd have to decide between 'em definitely . To be honest , we have the capa we have the design in-house , I mean we've we've come up with this , with this new voice What do you think on it Nathan ? About the voice rec ? I think if we we do both the obviously production costs are going to go way up I mean we we have to r reflect back on what our market research did say . and they said they wanted voice recognition . Course , maybe they hadn't thought of this whole touch screen option , but definitely we know the market is there for voice recognition Does having both really up our costs ? I can't see how it wouldn't , so we have to pick between one of the two . Um . we already have research backing voice recognition as you know fiscally solvent . But uh I I I personally would tend to another direction but if that's what's gonna sell I think that's what we need to go with I think the voice recognition is simpler , Is it cheaper to do the V\_R\_ or to do the uh touch screen ? Um , this is just off the top of my head keep in mind , but um , since we already have the technology in-house for the voice recognition we're not gonna have to do as much design work more or less you guys think that o o of the two of 'em , the voice recognition will be better . We will omit the touch screen in favour of voice recognition . You discussed either a lithium or a solar power . Would the solar power be enough to fuel a voice recognition ? Um , the solar power definitely would be but I think just to keep people from getting annoyed , we should install a small backup battery . we can't guarantee sunlight everywhere it works about the same as a solar powered calculator , and you know how those those don't really require that much light , I'm willing to agree with everything that's been said . If we're really not uh handling the remote control to a great extent we could possibly get away from the idea of having a hand-held remote control and maybe kind of have a round remote control that kind of looks like a paperweight or something like that , kind of a sleek little uh neat thing that sits on your table or

something . Why , why moving away from hand-held , why ? if you don't need to pick it up it could kind of be a selling point . if it's got voice recognition it can be technically anywhere in your room and still do its job . Do you think people that are people that buy a remote , are they always gonna wanna use the voice recognition I think we're banking on selling it to more than just voice recognition people , like we want it to work fundamentally as a basic manual too , we have to have buttons on it too as well . I mean , why not have a little rounded kind of thing , it could still have the basic buttons on it . And maybe a menu button and so forth , use a channel button to scroll through the menu d if they want to record programmes or whatever because we need to escape the traditional shape of a remote . I'm thinking of the airport portal , you know like that little pod looking thing ? I'm recalling that she mentioned that we n need to get away from the surgical white kind of brushed aluminium thing but you could have a very tasteful um wood coloured or earth tone kind of um Terracotta bowl or something . And the uh the material like the plastics and so forth , we were discussing that being uh using like a rubber kind of softer feel , if you feel the the tip on this pen it's a bit gives just a bit . something where it's uh a a more advanced f form of plastic that has some kind of a tactile response to it . Just kind of the squishy feel . let's see if we can do a squishy non-remote control-looking remote control . um . I guess we'll a that's gonna be uh a thing , if we run a bit over-budget , that might be okay , um . Sorry about the uh lack of information on cost , I just haven't been provided that information by our manufacturers we're more or less in agreement that we want to have a um a simple kind of function , you know , not too complex . although I'm not saying we should completely rule out major functions , they should be secondary , at least if not functionally then visually , Like maybe have menu things . If , if we're not going the touch-screen route then we can um just incorporate maybe something that folds out and something that slides down to reveal the you know more complicated things . we could do a slide or a compartment , Or you know , a b a b a a series of you know three or four buttons with a menu button and then a side an s up and down type of thing , like on um like on a D\_V\_D\_ player . we need to figure out what kind of buttons we're going to use , are we going to use scroll buttons ? Rubber buttons ? Um it seems to me that we could just do the um stick with the rubber 'cause since we're probably gonna be using some kind of um rubber for the outside case I think to a certain extent we have to stick with uh kind of uh a little bit traditional in terms of the buttons have we decided that we are gonna go with different style cases for different people ? because you have different cases and that might open up your market a little bit obviously , but obviously having more cases also costs more you could have uh a , you know , a um uh kind of a natural wood colour , like a stained wood and um , I don't know , olive green or something . That wouldn't be so much of a problem to incorporate into the colour of the thing . let's work on uh multiple case colours . stick with the same kind of kinda yeah , the same basic non-remote kind of remote design . we'll have the next meeting about half an hour , um . Nathan , I'd like you to work on just the basic look and feel , Um , what are our broad constraints before we deve design a prototype . And um Ron if you can figure out how probably best to lay out this idea of this simple design with the voice recognition built in and also this kind of drop down or s on the side kind of menu options simple . Um , and if you can check product evaluation with m some pilots and stuff . Um I need you guys to work together on making a prototype , um using um prototype building materials um . And also um specific instructions will be sent to you by your coaches as well .

## Complete Meeting Transcript

That's great. Alright, let me just PowerPoint this up. Right so um this meeting will be about the conceptual design, don't ask me s precisely what conceptual design is, it's just something important that we need to do. Um, think of it 's kind of uh turning the abstract into slightly more concrete. In this meeting ideally we'll come to some final decisions on what we're gonna do for the prototype. Um. Right so um, apologies for the last meeting, it was brought to my attention that I did not make the roles clear enough, um, so I will attempt to do so more accurately in this particular meeting. Um, fair enough, thanks for the input, 's always good. Um. So, basically all we're gonna do is have some presentations again much like last time, um, and gonna go through you, uh whoever wants to go first is f fine by me um and we'll collate what we know about um what we discussed in the last meeting, possible directions. And then we'll make some more decisions on um basic uh firm up our idea on how we want this remote control to look and work. So, perfect. So, without th further ado, whoever wants to go first is free to. Alright Nathan, take it away. It is Nathan right? I'm not calling you the wrong name over and over again? Good. Nice. Mm. Hmm. What kind of th thickness are we looking at? Okay, brilliant. Hmm. Hmm. M Maybe is there an option that we can have that off or on so a person can select like Yeah I like the idea, it's a good idea. Yeah. Mm. Mm. Mm. Can we do marketing piloting too? Try to see what kind before we launch can we see how they're received? Okay. Okay. Okay, perfect. Great, thank you very much Nathan. That's perfect, so I guess that makes sense for you to take it from here. Fascinating, compelling even. Tomatoes. Slick, slick. Interface, oh the interface graphics for the um Yeah. Mm. Yeah, it's like, yep it's ubiquitous isn't it? Great, thanks for that Sarah. Ron? Yeah. Lot of single people on the um on the re on the remote control research team at the Mm. Mm. Yeah, I can see. Mm. Great. Great, wonderful Ron, cool. Lot of good ideas, good facts to have. That's what they need, it's like a little dongle it just sticks up this further so you don't have to stand up every time, just connect it, my kingdom. Right so, good to know all that stuff, thanks guys, um. Now we kind of have to come to some decisions, um, I figure we can just go down the line and all three of us can have a chat about it. Um. Based on what Nathan presented as far as the um various costs and benefits um I think, I dunno, what do you guys think about the touch screen at this point? 'Kay. 'Kay. Mm-hmm. To produce each one. Mm. Hmm. Well. There is, it's just, it is a question of and how much ca o does that mean we're gonna have to increase the price to make money. Um, from twelve fifty if we d wanna get our fift uh hundred per cent profit margin um that would mean selling it from twenty five. If you multiply seventeen fifty by two that's thirty five. So From the board, um, well That's true, I mean And that's to be fair the um the per cent of the market we're not going for mass any you know, mass sales anyway, we're gonna make I mean we we're not talking about selling eight zillion of these things, we just couldn't, not for twenty-five Euros, so we could probably maybe shrink the profit margins rather than selling for twenty five, sell 'em for thirty, but that's something that we can have finance deal with. Um, I say that we provisionally go with the touch screen or wh y wh what was your thought on the matter Ron? Mm. No we could have a s very simple touch screen, you know, there's always the opportunity, if it's gonna be about the size of the iPod or whatever, you know, w we yeah, I guess we can play around with it a bit. Alright, let's let's say that okay so the touch screen will be our um our main selling point here. So The voice rec thing, I mean, if if we're looking at bottom line, now we're looking at upping the cost to seventeen to get the touch scr

een on, I think we might have to drop the voice rec. Yeah. Hmm. What do you think on it Nathan? About the voice rec? Mm. Yeah. I can't see how it wouldn't, I mean, there's you know the old aphorism, you can have it fast, you can have it cheap or you can have it quality, pick two of three. You know, you can't you can't have all three. It's just impossible. Well if we're gonna pick between e alright so we have to pick between one of the two. Um. Otherwise, yeah, we just it just becomes cost prohibitive. What which, which do we suspect we should hold o we should hold on to? 'Kay. What does the cost look like Ron? Is it cheaper to do the V\_R\_ or to do the uh touch screen? Nathan? Mm. Right. Mm. Okay. So I'm getting alright so more or less you guys think that o o of the two of 'em, the voice recognition will be better. Okay. Yeah. Okay. Sorted. We will omit the touch screen in favour of voice recognition. Yeah, well we'll we'll sic we'll sort out what it what f what else we're gonna talk about for the prototype but yeah that's our next step, it'll be a developing of prototype. Yes. We'll just run through it yeah, yeah, um. You discussed either a lithium or a solar power. Would the solar power be enough to fuel a voice recognition? Or this kinesthetic one, would that be enough to fuel a voice recognition remote control? Mm. Mm. Yep. Right. Okay. What do you think Ron? Okay. Hmm. Yeah. Well we have to have buttons on it too as well. But that's done, that's no bother I mean if you look at the catalogue from places like with sharper image or whatever you know they might have or like um who is it, Apple makes these really pretentious speakers with the th sub-woofers you know like clear and glass and you know and then they got these little pyramidal type of um speakers. I mean, why not have a little rounded kind of thing, it could still have the basic buttons on it. Um, 'cause we're going for basic functionality primarily as well. And maybe a menu button and so forth, you know um use a channel button to scroll through the menu d if they want to record programmes or whatever you know I mean we can sort that out. Yeah. Mm. Yeah, I mean a nice although we do um wh uh is I'm recalling that she mentioned that we n need to get away from the surgical white kind of brushed aluminium thing and get back to it but you could have a very tasteful um wood coloured or earth tone kind of um Still, I mean, yeah, along those lines. Yeah I like that, I like that idea a lot. Um, let's see what we can do as far as that goes. And the uh the material like the plastics and so forth, we were discussing that being uh using like a rubber kind of softer feel, um you know li lik if you feel the the tip on this pen it's a bit gives just a bit. You know something where it's uh a a more advanced f form of plastic that has some kind of a tactile response to it. Mm 'kay. Yeah let's see if we can do a squishy non-remote control-looking remote control. But to be fair, yeah, I mean, you just c you could just put it literally put it on the the ni the coffee table next to the telly and say volume up. Yeah I like it, I like the idea, that's good. Um and we've sorted of discussed costs, um. I guess we'll a that's gonna be uh a thing, if we run a bit over-budget, that might be okay, um. We'll have more of an idea when the prototype have more of a we'll have more of an idea later on. Um. And we just yeah go from there. Um, so we've revisited the touch screen and more or less ruled that out, um, I think so we're more or less con we wh wh we're more or less in agreement that we want to have a um a simple kind of function, you know, not too complex. Like maybe have menu things. Mm. Yes. Yeah we've also got the the me the thing of, if we're gonna have a non-remote-looking remote, how do we yeah. B But no I mean we could do a slide or a compartment, you know, like if it say it's a lit little vaguely ovoidal type of thing, it'd be easy to have a compartment in there. Or you know, a b a b a a series of you know three or four buttons with a menu button and then a side an s up and down type of thing, like on um like on a D\_V\_D\_ player. You know you see the modern D\_V\_D\_ players'll just have um a menu button on the side and then four buttons around them and you can just kind of manoeuvre through the menu like that. Well it seems like I dunno it seems to me that we could just do the um stick with the rubber 'cause since we're probably gonna be using some kind of um rubber for the

outside case we might as well stick with that um. Mm 'kay, um. We've already kind of covered this as well. That seems to be selling um and we we've more or less agreed that we want to target this youth market, um. Especially now with eighteen to thirty five year olds being such a large quantity of the population. Mm-hmm, mm-hmm. Okay. Um. Yeah alright, well, more or less covered what we need to cover I think fi an an any final thoughts before we think about doing the protot moving on to the prototype. Right. I was just gonna step on to um I wasn't? Oh, my bad um sorry. The um, yeah okay I was just gonna assign tasks in the next b anyth any oth any other final thoughts before we go ahead and cool? Um. Yeah. Well then again colours wouldn't be so hard to do, you could have uh a, you know, a um uh kind of a natural wood colour, like a stained wood and um, I don't know, olive green or something. That wouldn't be so much of a problem to incorporate into the colour of the thing. Yeah, I think that's probably a good id okay so let's work on uh multiple case colours. But yeah, stick with the same kind of kinda yeah, the same basic non-remote kind of remote design. Cool. Alright, so we'll have the next meeting about half an hour, um. I want the uh I'd like Nathan, I'd like you to work on just the basic look and feel, what can we accomplish, um, given these parameters that we're just gonna sort of have this kind of uh non-remote remote. Um, what are our broad constraints before we deve design a prototype. And um Ron if you can figure out how probably best to lay out this idea of this simple design with the voice recognition built in and also this kind of drop down or s on the side kind of menu options simple. Somehow work out how we can get this all s in the same place. Um, and if you can check product evaluation with m some pilots and stuff. Um I need you guys to work together on making a prototype, um using um prototype building materials um. And also um specific instructions will be sent to you by your coaches as well. So that's what to start with for now, is that alright, you guys feel clear about this? Alright. I guess we'll just hit the bricks. Thanks guys. That went well, thank you. Perfect. Go ahead. Nice. Mm. Right. Right. Nice. Interesting. Mm. Good call. Choose it. Well I'd say shop around but with our time constraints, is that really a feasible option? Right. Right. Um It's an option, uh but actually there's I've got some research already on like what we're looking at and trends in casing right now which actually might even come into play beforehand, it may help us decide for now. Temporarily anyway. I guess so, 'cause I found some interesting things. You waiting for me? I know, what a teaser ain't it. Um. Right. So current market trends. Screen. Um, basically I was looking at what's going on in the remote control market right now and what's going on in other design fields, to see sort of what's what's trendy, what's new, what's happening. Um, remote control right now basically everybody says they want newer, fancier, more exciting they're sick of this boring, normal, functional, um that we need innovative design options and there needs to be an easy user interface. Um the challenge is that current trends right now, across the board in fashion, in furniture, in technology, is a very organic fruit and vegetable kind of thing. Now I'm not saying we should have, you know, tomato shaped remote controls or anything, but I think it is pos

sible maybe to use um natural colours, like if wood is an option, that whole organic, sleek, clean, v line thing may be something we can look into. Different skin options, or if we can't afford this touch plate thing, or touch face screen interface um, maybe having the b images be specific, like you could choose your menu bullets to be a different shape or okay, not the example I would choose, but you know what I mean to t sort of and th apparently the feel of the next couple of years is spongy, uh not something I I've come up with a though if we can get around to getting piloting, I thought maybe a casing option like uh not like a skin, but like a holder almost if you could do like um, leather options or wood options or something Mm-hmm. Mm. Might be an interesting way to go. Um, yeah so something to sit on for now. So overall I think we should stick with what we're finding, everyone's looking for easy to use,

technologically innovative and this fancy new I think perhaps the double curve thing and maybe this rubber option is our best way to go for right now. Um. Yeah. Um. Well I d but then if the touch screen thing isn't gonna work out for us that's really a non-issue. True. Very true. Very true. Very much so. Um We could. I think that goes against the whole fancy something, a new line, but worth a shot. Ah, it could be, it could be, um. Yeah that's what I know. No problem. Mm. Yeah. Very true, very true. Mm. Hmm. Okay. Mm, right. Mm. Nice. Mm. Mm. I think it's our most marketable feature just because it's so new and it's something that is showing up in other places. But can we really afford it 'cause it looks like they would be, that would be a really main cost source then right? Per? Piece. I know And our goal was to be under twelve fifty or we have to be under twelve fifty? Do we remember? Okay. Can we justify it? Right. Though I think that's what people would pay for, I mean if you're gonna pay for an expensive high class remote, you're gonna expect it to do something Yeah. Right. Yeah. See if we can cut some corners. Right. Well and we can look into this other manufacturing option, and maybe we can get 'em somewhere else cheaper. Right. It's a starting point anyway, so. Mm. Yeah 'cause with voice recognition I mean really this is pretty bells and whistles kinda remote. I think we'd have to decide between 'em definitely. Price-wise. True. We've already got it. Pretty much. Right and they said they wanted voice recognition. Course, maybe they hadn't thought of this whole touch screen option, but definitely we know the market is there for voice recognition so to say we have the technology and we're not gonna use it even though we know it'll sell is a call I don't think I can give the highs ups. Like really I can't go in and say no we're gonna just ignore everything we know. Yeah. Yeah. Well, we already have research backing voice recognition as you know fiscally solvent. But uh I I personally would tend to another direction but if that's what's gonna sell I think that's what we need to go with and maybe we can table this touch screen for our next model. Mm. Right. Right. And we're still not then we don't have to deal with this battery issue nearly as much either, we can stick with what we've already got. In a lot other ways too. I think it's our lower risk option which for right now we can have it on the market sooner which is all in all our best option. So and when are we gonna have basic prototypes coming up next that's you guys's next step right? Right. Okay. Mm-hmm. Yeah. Well what of people with like the T\_V\_ in their basement, like what if wha we can't guarantee sunlight everywhere so having a secondary source is probably Yeah. True. True. Right. Okay. Uh Interesting. I if it's got voice recognition it can be technically anywhere in your room and still do its job. True, and i probabl I think we're banking on selling it to more than just voice recognition people, like we want it to work fundamentally as a basic manua

I too, right. Mm-hmm. Yep. Yeah. With the bu yeah. Mm-hmm. True. Way to go. Yeah I'm thinking of the airport portal, you know like that little pod looking thing? Right. That would be kinda neat. Terracotta bowl or something. Mm. Mm. Yeah. Yeah, which is the next big thing, so that's not gonna hurt us either. Right. Handy. Okay. Mm. Right. Well when the majority of people are only using the most primary functions on a daily basis, although I'm not saying we should completely rule out major functions, they should be secondary, at least if not functionally then visually, like those shouldn't be Take precedence, yeah. Right. And they slide. Well and do we wanna consider like an iPod screen which isn't a touch screen but you're still scrolling through menu options, in p True, we're still not making it easier then. True. Fair enough. Yeah. Mm-hmm. Yeah it's just a scroll. Yeah. Yeah. Probably. Right. Mm. Well no it's basic just like four directions that are that can use as menu or channel and volume or however you wanna do it, are really versatile and everybody's already got them to some extent on the remotes they already own so it's not like we're dealing with everybody relearning things 'cause that's not something anybody's gonna wanna buy a new for. Mm. Right, particularly in technological fields, so that's exactly

where we're headed. Uh. Oh it wasn't in the way but yeah, whatever. No, don't worry about it. Okay. Yeah. Yeah. Right. Mm. Yeah. Yeah, get in there. Yeah, totally. Cool. Cool. 'Kay. I'll go first. No Nathan's fine. It's either Nathan or participant two. Uh. Okay. Um, basically what I'm gonna have to talk to you about today is um component design and it's been brought to my attention that we may be somewhat limited as to what we can do because of what our manufacturer offers, so Basically what I'm gonna be doing is talking to you about that. Um, components of a remote control, okay. We've already kind of gone over this but we're gonna have to get into more detail and probably have to reach some conclusions some time soon. Energy source, um, our manufacturer offers a variety of energy sources, your standard battery, solar cells. Our manufacturer didn't say anything about lithium so we might have to look if we do go that route, we might have to look elsewhere. Um, and also there's a kinetic energy possibility. Basically, it's like a um the idea of moving the remote would create enough energy to keep it running. So that's one possibility but I don't know whether that would be powerful enough to illuminate a touch screen. So we'll have to look into that. Um, the case, we have a few options, plastic, rubber or wood. Um and then as far as the way it's shaped, we can do standard boring flat, which we probably don't wanna do, curved or very sexy double curved. Um, I imagine that we could specify. Um, I don't see any reason to go outside of the convention of three or four millimetres. Yeah. Um, the buttons, there are multiple scroll buttons available from our manufacturer, but to use those we'd have to use more chips, um and that would cost us more. And if we do go with the rubber doubled curved case um we'll have to use rubber push buttons because the other buttons aren't compatible with that. Um and just a little note there, touch screen equals many chips which equals many Euro. Um, one thing that I noticed was that most remotes operate on a infrare on the infrared part of the spectrum. So you notice when you push a button on a remote you can't see anything coming out of it but in fact there is light coming out of the remote and you know the television can detect that. And if you were to record if you were to make a video recording you could actually see the light. Uh one thing that I thought might be interesting was to use part use visible light coming out of the remote, just kind of as a fun gimmick. So you could actually see something coming out of the remote when you pushed it. Course it'd have to be a part of the spectrum

that wouldn't damage the human eye or anything like that. Yeah. I am sure that we could do that. Um, of course Yeah, just as a fun gimmick. Just to set us apart a little bit. Um, and then on to the circuit board that we're gonna use, also known as the chip. Uh, we really don't have any way around the T\_A\_ one one eight three five. Um findings, okay, we're very limited by what our current manufacturers can offer, um and my question to all of you is, should we look to other manufacturies or should we just make do with what we have available? 'S a bit of a challenge question. Right, that's my concern too. Um, if we do go the lithium battery route then we'll have to go outside our current manufacturer. My personal preference is I'll just throw my cards on the table, uh I think we should probably go the solar battery route, just to kinda keep with the environmentally friendly theme that we have going on. Uh, I like the idea of the visible light signalling, that's something to set us apart and uh I was thinking about I was thinking of ways that we could produce the remote in a variety of different case materials to suit different tastes. So we're not so confined by one style and say some you know, say our the one if we just go with one and it doesn't go over well then we're in a bad situation. Oh yeah, you're welcome. Mm. Mm. Hmm. I should have mentioned this um. As far as the rubber that we can use we can use a rubber as part of the case, it has a consistency of those stress balls. Mm. I like the idea of of rubber too because it's tends to be associated with being durable, something that you can drop and it doesn't matter. 'Cause so many you go to so many houses these days and you see broken remote controls.

Taped with duck tape and what have you, you wouldn't have that problem if you used rubber. Mm. No. Yeah. My estimate is that in order to incorporate touch screen technology it's gonna cost us upwards of seventeen fifty Euro per remote, yeah that's just an estimate though. I know. It's fun. I thought there was some flexibility with that. That's just off the top of my head, it is pending further emails. Right. It is the new it would be in a class of its own. It's true. We could initially go with what we have and if we can find them cheaper later on Yeah. I think if we do both the obviously production costs are going to go way up um but it does put it into it'd become the Rolls Royce of remote controls basically. It would be very nice. Yeah, 'cause you just upping the number of chips that you need to deal with each different function. I would have to side with that, I think the voice recognition is simpler, we already have the all the technology in-house, it's ready to go, it's packaged, it's Um, this is just off the top of my head keep in mind, but I think the voice recognition would they're both mm they're both gonna push the costs up, but um, since we already have the technology in-house for the voice recognition we're not gonna have to do as much design work and sometimes the design work is what push the costs up, if you know what I mean. Yeah. Are we going to talk now about um the materials that we're gonna use for the case and all those things? Okay. Um, the solar power definitely would be but I think just to keep people from getting annoyed, 'cause sometimes solar power fails and there's no way round that, we should install a small backup battery. Just to cover those moments when for whatever reason, the remote hasn't been exposed to It's true. Yeah, it works about the same as a solar powered calculator, and you know how those those don't really require that much light, um, but obviously a little more light than a calculator, but we're not talking about a lot of light. Doesn't have to be out taking a sunbath for a few hours a day or anything. Hmm. Why, why moving away from hand-held, why? What's the uh idea? Hmm. Do you think people that are people that buy a remote, are they always gonna wanna use the voice recogni

tion or is it just something that they do sometimes. Right. I think, I think you're on to something because we need to escape the traditional shape of a remote. Maybe something that looks nice on a table is would be good, even though and hand-held the same time. Yeah, those are nice. Mm. Okay. Right. Just kind of the squishy feel. Sorry about the uh lack of information on cost, I just haven't been provided that information by our manufacturers and I'm just having to guess. Right. If, if we're not going the touch-screen route then we can um just incorporate maybe something that folds out like what you often see on these kinds of remotes is the most basic functions up here and something that slides down to reveal the you know more complicated things. Yeah. Right. So are we gonna are we talking we need to figure out what kind of buttons we're going to use, are we going to use scroll buttons? Rubber buttons? Um Right. Right. So have we decided that we are gonna go with different style cases for different people? Or are we just going to go with one? ..It's very, it's very hard thing to predict because you have different cases and that might open up your market a little bit obviously, but if you have just one case and it doesn't go very well mm. It's a tough situation, but obviously having more cases also costs more so There's an idea. Right. Oh excellent yeah. That sounds good. Mister participant two that is. Interesting question. Yes. Did you? I like it, I like it. Yes. Fabulous. We can have a duck tape casing. It could go with the granola crowd. Phew. Computer's adjusting. One moment please. So interme interface concept by your faithful user interface designer. So yur user interface, guys, is basically aspects of a computer system that we can see or hear, or otherwise uh perceive. Uh, commands and mechanisms, that basically user uses to control the operator operating system. Here's a d series of different remote controls that are out on the market today. I think we're definitely trying to get away from this kind of a look. Um, so the following are a bunch of different uh interface uh concepts. Uh voice recognition, we we um actually have some new uh information from our research design team but uh I'll

get to that in a moment. Um, so current voice recognition starts up to about eighty speech samples, um and basically you record your own verbal labels and connect them to the remote control. Now our design team, research team, has been able to uh set up a system in which uh you can teach the remote control voice recognition system to respond to um with standard responses. Like you could say good morning uh remote control and it'll say in a sexy female voice, Good morning Joe. Um. In fact we already have this for a coffee maker line On the remote control right. Um, another concept is what uh Apple has come up with, the spinning wheel with uh LCD display like on the uh iPod which I am sure most of you know about. Um and then we have the scroll button with integrated push-button, kind of like a modern a bit bulky, a bit crazy, I don't think that's we're necessarily going for. And uh some special components, uh ideas like uh blocking, having the ability to block channels from your for your children um and uh dedicated buttons for for commonly used uh channels and even uh ideas like secured or hidden programming but uh I again if we go with touch screen I don't think that's a big issue. Um and uh this is kind of the uh the big daddy of remote controls here. Uh the jumbo universal remote control is almost impossible to misplace or lose. Um, again probably not what we're going for so I mean my ideas here and kind of where I think we're heading is something slightly larger than a regular iPod uh with a hard plastic casing although I think some of the suggestions we've come up with are definitely uh very good ideas. Uh changeable casings uh our design team was possibly talking about including one extra face plate with the pa

ckage to kind of set the idea that you can change it and you can try changing it and kind of get used to thinking about maybe buying another one which can add value to our uh bottom line. Uh touch screen interface, um possibly having go-to buttons being uh stuck into the system so those don't move away from the screen, uh, the important ones like power, volume and jump between channels. Um, and of course our voice command system which I've talked a little bit about already and uh the use of recognisable colours and shapes to aid recognition of the features um that are around so red for power, um arrows for different volume ups and downs and channels ups and downs and what not. And uh perhaps even adding in some stupid little jokes with the voice recognition idea like perh mm for instance my toastie maker that I got from my bank has jokes when it's ready. And uh that is about it. Oh you guys are always the dampers on these projects. You industrial designers. Where do you guys come up with these numbers? I'm thinking that's uh definitely a good idea and I also think that we could probably come up with some sort of a cheaper uh means to to go about this kind of production, my my team in the uh on the third floor suggested that uh Yeah. I mean I think that we really have two main selling points, I think that our casing and the voice recognition To be honest, we have the capability we have the design in-house, I mean we've we've come up with this, with this new voice we're using it for our coffee machines already. I can pass you on that email from my uh guy in uh guy down the hall. Sounds good. I mean we we have to reflect back on what our market research did say. Does having both really up our costs? Well my point is Um, I definitely have to agree with that last comment. It's you and me outside a little here. Calculator. I'm willing to agree with everything that's been said. Uh I have to say though that um another idea's come up in my head. If we're really not uh handling the remote control to a great extent we could possibly get away from the idea of having a hand-held remote control and maybe kind of have a round remote control that kind of looks like a paperweight or something like that, kind of a sleek little uh neat thing that sits on your table or something. Just a thought. Well if you don't need to pick it up it could kind of be a selling point. I think it's all about following Apple's lead on a lot of these things. Mm-hmm. Exactly. Think then we're hitting our cost issue again. I think to a certain extent we have to stick with uh kind of uh a little bit traditional in terms of the buttons and then and then make

our unique feature our casing and what not and our voice command. Well what are we actually doing? What were Sure. And again copying iMac's kind of for iPod Mac Apple's uh colour scheme. Fabulous.

---

# Meeting ID: 6

Data Source: Train

## Executive Summary

The User Interface Designer presented three different concepts to consider for the user interface and introduced the idea of using speech recognition in the design of the remote. The team discussed the issue of using speech recognition at length. The Industrial Designer presented possible materials to use in making the case for the remote, introduced the option of using a solar battery, and discussed options for buttons. The Marketing Specialist discussed recent findings from trend watching reports. The team discussed what materials to use and their interface concept.

## Complete Meeting Transcript

So let's start our second meeting on conceptual design. So, as the previous meeting I will be the secretary and we will have three presentations and we'll have to decide on the remote control concept and finally we'll close the decision. So I will first uh What? I think I will let uh our User Interface Designer speak first, Mister David Jordan. So, we'll S technical accessoire? Interface? This. I'm not sure the one in the middle is very attractive. It's very big, yeah. Okay. Yeah, why not. We'll have big discussion I suppose after that, so. Okay. Something else? I just have one question, because for the intelligent controller, you said that we can use the voice recognition or the gesture recognition, but as the um expert told us, most of the people want to use the remote control to zap t to zap between channels. Do you think they will be able to use gestures? Because, if they do all the time the same gesture, as you said previously in the last meeting, maybe they will get injuries because of that? or if you say channel three channel three two three four six five, I think they will be bored after a while. You don't think so? Yeah, sure. I That's true. Yeah, but suppose you got a cold. You have a mute remote controller. Broken arm? Yeah, but suppose you have a family watching T\_V\_, and if they want to use their private remote control in the same time, do you think it will work? Everybody wanting to change channel in the same time? Why? If you have one brother and one sister and they want to watch their favourite uh T\_V\_ programme, so they say oh channel four channel three channel four channel three all the time, so. Yeah, but you have the remote control, so maybe you can keep it f with you. You're not you're not obliged to share it. Yeah, we can yeah. Yeah, I think it's a disadvantage. Yeah, but one other

question. How much will it cost? Yeah. Because I suppose we need to do research to have something working. Some efficient. So you think it won't cost a lot for us? Or? Yeah, but uh uh Mm-mm. Yeah. I agree with uh Yeah, but there is one problem that uh Baba talked about is the international remote control. We need something that is international. Suppose we're we want to sell it in France. The recognition system will be able to understand French. If you want to go to England, it will be able to understand English, so. Mm, okay. And with no increase in the production price of the remote control? Yeah, but how will you Oh. Seems to be quite complex. And what about voice recognition, do we have microphones? And where will be they? Do you think if we're far from television it will work? Yeah, but where is the controller? Yeah. Yeah, but we're here it's uh an object. But here you say you want to use uh s technology. Yeah, but what is the use of voice or gesture recognition if you have a remote control like this, if you have an object. If you want to use voice or gesture you need to be free, without any object. You just want to interact with television. Yeah, but you can lose it. Okay so you can build a kind of black box and put it on T\_V\_ and just to recognize gestures and voice. Ah. Yeah, but Mm. I think so. And maybe it will be quite Okay. Hmm. So, what do you think? We'll try the controllers you'd prefer. Which kind of controller would you prefer to use, you as a remote control user? So I think it would be better not to do any intelligent controller and to stay with the Google controller or a fancy controller. Maybe try to mix the Google controller and the fancy controller? Hmm? Just want to have something controller which is in a kind of intelligent controller, easy to use, sophisticated and fancy. You think it's possible? Yeah, but uh we want so Yeah, but we want something that works all the time, every day, every hour, for everyone. You don't need to tune it. Yeah, why not? If it's Not too expensive too. Okay. So let's go to the Industrial Designer. Maybe we'll be able to take a dec

ision after that, so. Two? Working? I can Okay. It's okay Uh I think there's something wrong with your Maybe you you record it somewhere else. Interface concept. No. Mm mm. Uh. Nope. It seems that we have a problem with the Yeah, so No, I think it will be more interesting to start with uh Yeah. You will had some more information in I think it will be interesting after your presentation to have um Baba's presentation. So. Okay. Okay, never mind. Mm-hmm. Mm-hmm. Mm-hmm. Okay. Yeah, I think it's an added value to the remote control and maybe it can attract all the ecological k yeah consumers and but about the the price of adding this solar battery, would it be something really that will increase the price of production more, no? So. Okay. And what about the uh materials? Impersonal, mm-hmm. Yeah. Yeah, and if you we want to put fashion in electronics maybe we can try to do something with wood. Mm-hmm. Mm. Mm okay, seems to be interesting, mm. Yeah, we want something easy to use and so I think maybe something very low level would be enough. And you think that we will be Okay. So wood. And what about the buttons? No it's fashion, yeah. I dunno. I think we have only uh five minutes left. Participant four? Functional requirements? This one? Okay. So we have to take decisions about the component concepts, about the energy. So, as you say you want something technologically innovative, maybe using solar energy and with battery would be something interesting, maybe will attract pro-ecology consumers. Uh cheap imprint so you s you propose low level chips would be uh enough to have something working well. Case. So you think case. Something spongy. Someth no wood. Maybe you It's it's natural. Th The feeling is natural, so maybe we can stay with wood. But it's still fashion. Yeah, something that you can into it. Uh and what about the user interface concept? Google and fancy? Because I think that with the voice and gesture recognition there are still some disadvantages with this. Yeah, but you need a receiver to recognize the gestures and the voice. That's true. So maybe we'll just focus on the Google controller plus the fancy controller, maybe try to mix them

these two concepts together, just in one and do a remote control with solar energy and batteries and with low level chips and wood. And L\_C\_D\_ buttons. Yeah, I think for these supplements the solar energy would be something quite interesting and not maybe too difficult to add. Yeah, for the interface something added value. With a module? You mean the remote control with a micro module if you want you can just use commands, words and use them when you don't want to use your fingers. Turning the T\_V\_ on or off. So, adding some vocal commands. Simple ones? Okay. So the next meeting will start in thirty minutes so we'll you will all have to work in in your direction. So you will have to work on the look and feel design, to have the easy to use, powerful and fancy remote control with some added value such as the uh simple vocal commands recognition. Uh you will have to work more, Baba, on the um spongy way to to add spongy um touch to the buttons and try to find maybe a nice shape for the wooden remote control. And I suppose I think we'll have to evaluate the product too. Yeah. Yeah. And remember as I said last meeting, we really have to build a fashion remote control and uh the colour of the um the society will be really it will be seen in the remote control. So you will have Baba and David Jordan you will have to work together on the prototype and you will have next time to show us um modelling a clay remote control, so you will have to model something. And I think that some specific instructions will be sent to you by your personal coach. So, no more questions, we can close the session. Yeah. Okay, cool. Yep. Yeah. No no no. Yeah. Mm. So uh first I will present the concept of user interface. Um there's three concepts in the user interface. So first

the first one it's a Google controller. The second is a fancy controller. The last one is uh intelligent controller. So there are three concepts in our controller. Um next I will explain one by one, the first is Google controller. Um, so I want the controller to be easy to use, but with sophisticated functions. So it's a combination of easy to use and um sophisticated functions. Uh this is a first concept of our controller. The second concept is a fancy controller, um so we want give the customers the impression that our controller is very attractive, um they can easily recognise our controller among a lot of products, so so the user interface should be very very cute, very very good um attractive. Such like this, there are several uh examples in the slides. Yeah, it's very, you know if you're Yeah. It's hard for it's easy for you to remember it. Or to recognise it, yeah. Yeah. Yeah. Yeah. So the last uh concept is intelligent. We want uh we want our controller to be smart, so maybe we should uh use um uh technology, such as speech recognition technology and gesture recognition technology, so we need to have some cooperation with some research institute on speech recognition and um gesture recognition. Um With this advanced features we I think we can attract a lot of user. Okay. No. There this is the three concepts of our controller. Yeah. Yeah. Yeah, so Y Uh I think some time it's very uh convenient to use voice interface and gesture interface than use button. For example, if you cannot find your uh controller, you can just uh just uh speak something such as, yeah, one two. Yeah. So you can use your gesture. That's no problem. For limited vocabulary speech recognition is very reliable and for limited vocabulary gesture recognition is also very Yeah. Yeah, they cannot speak at the same time. Yeah, it's very interesting. Yeah. Yeah, that's that's the advantage of intelligent controller. Even you have the controller, I can I can say channel three, so it's come to channel three, I don't have to. It's advantage. How much? No no we we just are use um No no we just um have some cooperation with some research institute, we don't have to do some basic research on this field. Yeah, I think it's uh because uh this technology is uh um for limited word or limited word uh lexical recognition, it's very it's uh yeah. It's No it's uh Even for the um because the the vocabulary the The vocabulary is very small, so that's not a problem. Yeah. Yeah. Yeah. Yeah, the key, the key um the key of our the key feature of our controller is that it's it has some some um adaptation mechanism. It's It's it means when

you when you sell this controller in China it's can recognise Chinese. It's r if you sell this controller in France it can recognise French. Yeah, it's Because of this product uh this technology has already been developed. So Yeah. Yeah. Oh n Yeah, yeah tha that's why we have to do language adaptation. Yeah. Even for each f for even for different family we have to do d yeah we would we have to do adaptation to No, it's not so complex. No no no it's not I think that's n that's not a problem because you you don't have to wear a microphone. It it just the microphone is embedded in the controller. Where is the controller? It's in your family, in your home. Yeah. Yeah you can you can embed it uh microphone here. Yeah yeah just you just put the controller here, then you you use your command and you do s your gesture. No no it's n y if you lose it Yeah. Yeah. I think it we should give the uh flexibility to the user and we think yeah. You can see they can switch form one modality to another. No, that's quite inter quite attractive. Well, if you do language adaptation, there should be no problem. We should have confidence in technology. More features, yeah. Yeah but if you stick to um stick to the first two parts. So what's the difference between our controller with other products in the market? There's no k fe

atures of our controller, so is there is there any necessary to design new controller without any breakthrough features? Would y would you replace your controller with a controller with similar function if you do not have some some function inside it that Yeah, you y that's a fun that's not the function of the controller, that's a function of T\_V\_. You can replace your T\_V\_ with a new T\_V\_ with internet browsing function, but Okay. But it's not the only the problem only the issue of controller, it's it's also the issue of the T\_V\_. Yeah, but we do we do we we cannot rely one hundred percent on these features to u to use the controller, but with the features of our controller such as you have the feature of voice recognition in your mobile but you seldom use it, your mobile, but you when you choose a new mobile, you choose the one with voice recognition. That's the feature is not one hundred percent reliable, but it's a feature to distinguish our product from our from other products. Yeah. Yeah, uh Yeah, if if if you're if you ar if you already have a product it works one hundred percent reliable, would you replace it with another one? Yeah. Yeah. Yeah. Yeah. Oh yes, but there's no big difference between the traditional controller. The then nn no. Tha But the there's there's n there's n not enough motivation for them to replace their old controller with a new one if there's no key feature in the new controller. That's the same yeah. Yeah. Yeah. Okay. Yeah. It did didn't r receive it. Didn't receive it. Participant one. Participant one. Yeah, maybe we can first come to uh to Frahan. With Frahan, then you can prepare your slides, then present it later. Okay. Okay. Okay. Okay. Mm-hmm. Okay. Uh-huh. Mm-hmm. Mm-hmm. Mm-hmm. So you got email? Mm. Later? Pla Uh yes. Yeah. Yeah. The smart controller. Okay. Mm. Yeah. It's good. Mm-hmm. Yeah. Yep. Yeah. Yeah. Okay. Yep Okay. Okay. Mm-hmm. No y you do the minutes first, or? No? Okay. Mm. Mm. Mm. Mm. Yeah but how how is how risky is it to trust like speech recognition or gesture recognition? Okay. Okay. But this this but this would never happen anyway. Yeah Yeah, but the Yeah but this Yeah. I don't think it Oh, okay, okay, you mean it could be a problem for this kind of stuff. No. No, but this is disadvant disadvantage. Yeah. Uh if you if if you use the basic But it's it's changing how the remote control is gonna be built. Because then you need uh I mean this doesn't have uh the power to do recognition, for example. Yeah. Yeah, this could be downloaded by the web maybe, or Yeah. Mm. Yeah, but then w Yeah, we have to take care of the twelve Euros problem. Okay. No, but then it's it's like this uh Yeah. But you would still have the buttons. Or is it do you think it should be only voice recognition and gesture recognition? Or you you still have the possibility to use buttons? Okay, so you yeah. Yeah, I dunno. It's a bit risky risky. Yeah, I dunno. What? If if I mean, uh I'm sure if the user pays the same price, he's happy to have recognition. But if if if it like doubles uh no one would would be interested. Yeah. No, I mean Y No, but you need you need

new remote controller then. Because if you wanna browse internet or, I don't know, if you wanna type something, or No. No. Cause for example yeah. Yeah. Yeah, you would True. I mean, for example the goo y you say we would we would have a Google-like controller. I don't see how adding speech or gesture recognition would make the remote control look more like Google. Google is simple, works fine, so I I guess if can have a remote control that is really basic, simple and works fine, it's already a lot. Uh thi this I mean, the user is not only interested in having speech or gesture recognition or if he has something that works fine and is really fancy, looks nice and it's easy easy to use, easy to use. See That's the problem, yeah. I mean, I I know it's more interesting to develop a remote controller with speech and gesture and w

hatever. But you have to think, the user is the one who gonna buy the product and so. I mean, that's the point. Hmm. Yeah. Dunno. I dunno if you remember what you had to say or I think it's more interesting what he says, okay. Yeah, true. Yeah. Yeah. Yeah. Special for Mm-hmm. Yeah. What about the touch scr touch screen? For example. It's it's expensive I I guess. Mm. Yeah. Okay. Uh no, trend watching. The other one. Yeah. Uh, I think so, just Yeah, so just to meet the user requirements I would just do a s short anal analysis of the remote control market and to kind of um have a better overview of what's the fashion in general I've checked more than only the remote control market, so next. So again, it's pretty much similar to what I've said in the previous meeting. Um user really really want a fancy look and feel. They're not so so interested in uh functional look and feel, okay. Like the one you've shown, David, with all the buttons and I mean i i it sounds good technically but it's it's not what they want and uh So, second point is they still want it to be technologically innovative, so maybe it's sort of related to what you've said with the speech recognition and so on. At the same time, it's important that it's easy to use. So that were the three first points from the remote control uh analysis. Now i if we look at fashion in general um Okay. Wha what we really see this year is that uh everything from clothes to shoes and furniture is is inspired by fruits and vegetables, okay, so I think we really have to take this into account for the design of the the thing. 'Cause it's it's really what people want. Even if it's in general fashion, we want it to be in the remote control. And then uh if we take the ordering or the ranking of all the points, fancy look and feel has, on a score of seven would have six as importance. Uh the remote control has to be technologically innovative, it's three. Then easy to use uh it's not so important actually with respect to other y other ones. So we see fancy look an look and feel is the most important one, and then if we combine this with the fashion uh from Milan and Paris we go to the fruits and vede vegetables. And the other point I haven't mention is people wan want to have a spongy touch, okay so this is this maybe doesn't really fit with the wooden design. I dunno. Yeah thi this is this would be like um plastic-like, but rubber, mayb maybe, you know, rubber-like uh device, so um Okay, tha tha that was the main point, I think, from the trend in fashion. Yeah, so when I think it's Mm-hmm. Maybe not no wood, but I mean ma maybe not the part you touching you know. Yeah, maybe the base. But still y Yeah. Yeah, I mean it's not exactly right for the spongy point of view. But we could maybe have both like part of wood and some rubber for the buttons, or I dunno. Yeah. Yeah. Yeah d I dunno. What interface? Yeah, no not forgetting about the fruits and vegetables trends. If possible. Hmm. Okay. Mm-hmm. Mm. A nice one. Yeah. Yeah. Mm-hmm. Yeah. Yeah. Maybe. Oh yeah, that's a good that's a good point, so. One and Yep. Yeah but Yeah but the same can happen even with it you know this kind of remote control because the That's right. It's it's And mayb maybe we can have the switching mode to pass from you know voice controller to manual controllers, eh. No, more expensive maybe. Well y y you have also the language problem, you know when you 'Cause it it have to be universal, so. Yeah. Yeah but you know. The product The pro It's a very smart, it's a very smart controller maybe Oh yeah yeah

yeah yeah. But Yeah but the problem is how to s you know if this is a push button controller, you can send this con this remote control everywhere in the world, the same one. If you have the language, you have to develop for each country. Yeah, but for each country you have to do one, because uh the for example for Se Oh really? That's Comple A microphone maybe. To talk to the to the T\_V\_ maybe. I if you say one,

he switch to channel, yeah. So well for example if it is somewhere in the room if i maybe if it is in the table there you can always say s channel one and the t the remote control gives the order to the T\_V\_ to switch to channel one. Devic Yeah. Yeah. Yeah but so you need a camera and you know a microphone inside your remote control. Yeah. But I think that, you know, switching from one country to to another will be a problem, so although y y Yeah but i i Yeah, we should. Uh. Mm. Yeah, but I think he need a control that is very reliable, so. Yeah. Yeah. Yeah. It's not really the we we can add for example some function like for browsing in internet, so or something like that. But uh I think a user need Don't have a the the Yeah if we can send email from it. Because the p the problem I can see with with the voice or the gesture itself wh what can happen in a family i i for example if Yeah And for all the person of the family maybe, so, yeah. Because you have new Ye Okay. Okay. Yeah, participant two um Yeah, working design, so. So I think Can you go to the next one? I uh it's not this one. It's uh oth the oth so I It's the working design. Sorry. Component design. So this yeah so this is the described use What? Are you inst I don't think so. Oh. Maybe I record recorded directly on the Computer. Okay, okay. Yes. I can say it to you without. Yeah, exac Okay. Yeah. Yeah. In fact, I don't know, I s because i in my presentation I don't have here with so It was in fact the design use to show you the design of what is inside a what is inside and what are the different component of the r of the remote control. So it will be interesting so I could show you some some picture of what is inside and so. So I in fact the the f something I want to discuss is which kind of material are we going to use, so will it will be wooden wooden di wooden remote control or a a plastic remote control like this one. So and in which which which kind will be the the different bu button, so it can be some, you know, classic pushbutton like this one, or you have also some button like L\_C\_D\_ where you know, the button the buttons are unlighted during the night, or, you know, you can see them in the darkness. And the other thing I want to discuss also is which kind of alimentation, electric alimentation do you want to have, so will it be for example uh d uh solar energy alimentation or will it be a battery like the classical battery so. And I think that for example for the alimentation it would be good to have uh both of them, so so for example in some country where you are in the the countryside and you are far from, you know, the cities uh for example in some place in in S Senegal, so if you have electric if you have solar alimentation, you just, when you want to have recharger or remote control power you just put it on the sun and after one hour you can come and so it can be interesting for people to have this kind of remote con It can be something interesting to make people buy it, for example. Yeah. Yeah, yeah mm. Ecologists, yeah, yeah, yeah, yeah, yeah. Alrigh In fact, having them both will if we want to have battery, regular battery and and the solar energy battery it could be it'll it will add a little bit of the price, but it will be an added value also that will be compensated, so hmm. And the materials, it depends for example you if you have a wooden material it can be more the plastic material is more common it's very resistant but, you know, something wooden will be like, I don't know high cl so a special high class, or you know, you can have some Yeah, even if it is not completely wood, but just a part of the, you know, will be wooden, in wood and it can be interesting. And so the last point is y also would do you want to have some very cheap integrated cir circuits, chips, or do you have low level or or very very expensive, it depends, but I think that low level will be, you know, it is an interim module. Yeah. Yeah. Yeah, yeah. Yeah, I think it will

fit on the price we want, twelve twelve Euros, so. I think the buttons I prefer, you know, the L\_C\_D\_ you know lighted buttons because, you know, it's I don't know um yeah, in the dark, it's fashion and it's related to how beautiful it is or uh if you want to watch T\_V\_ in the darkness or if you want to find your find your your remote control that is lost, you know in the darkness it's very easy so, right. I think a touch screen will be t as expensive as the L\_C\_D\_ buttons so. But And it is a kind of other design, I mean. It can also be interesting to have this kind of Mm. Ah yes. Yeah, yeah. Okay, yeah. Okay. And fruit and vegetables yeah. Spongy 'Kay. Okay, yeah, yeah. Yeah, but the problem is which kind of material do you need to be spongy? Plastic Very stuff Okay, rubber rubber design okay, yeah. Yeah. Yeah. Okay. Yeah. Solar. Okay. Yeah. It will be a Yeah. Yeah, I think Yeah, yeah. Yeah. No wood but Plastic? Would some I think we can have wood for example in the bottom and, you know. It depends on the design we want, so. Yeah, it's natural and i And it can be correlated to energy, solar energy, so for the marketing aspect, you know, saying that it's eco Mm, yeah, it's not right, so. Okay. Google and and fancy, f how about the the voice? And Uh maybe we can do some marketing studies asking people if they're interested and how It It is an an interesting concept to see to have uh voice control. Mm. Yeah. But and the problem is I I'm we can infer i if you have v voice control why not to put it directly on the the T\_V\_, so speak directly to the T\_V\_ and you don't need a remote control actually, so. But it will be embedded on the T\_V\_ and not on the remote control, so. Yeah, L\_C\_D\_. Yeah, yeah, yeah. And pf what can we think a supplement to I think the supplement can be the voice. It is just, you know, it is not the most important, but it can be a part of Yeah, yeah. Yeah. Mm. To push button, yeah, yeah. Even it is for s just some kids, you know, switching channels one two three four. Yeah, turning yeah, yeah. Not very complex commands, but easy commands, so. Yeah. Yeah, simple ones for expensive buttons Yeah, to make some new Yeah. Okay, fruits. Okay. Need it to be, okay. Okay. Okay. Sounds good, mm-hmm.

---

# Meeting ID: 69

Data Source: Train

## Executive Summary

The project manager recapped the decisions made in the previous meeting. The industrial designer discussed possible materials to use in making the case for the remote, options for buttons, and options for batteries. The interface specialist presented two existing products which incorporate features the team is seeking to embed in their remote. The interface specialist also discussed other features to possibly incorporate into the design of the remote, such as an LCD screen. The marketing expert discussed recent findings from trend watching reports and how to incorporate these findings into the remote design with respect to what materials to use and the overall appearance of the product. The team then discussed other options for how they could incorporate a fruit and vegetable theme into the appearance of their product. The team then discussed other options for batteries, chips, buttons, and materials for the case, as well as the option to have a menu function.

## Complete Meeting Transcript

Yep. Uh-huh. Don't think so. Jess. Alright, so I'm gonna describe the the concept of the user interface of this des device. Um we've talked about uh the two essential properties of the user interface. We want it to be simple and we want it to be fashionable. Um other we've also got to remember that this is a device that serves as a useful purpose. Uh we want people to be able to use it s as a remote control, so we need to determine what the essential functions of the d of the device are and make sure that we include that we've included all of those and that we actually end up with a device that is going to be useful to people. We have a number of different choices for a design concept um and s that's that's something that that I'll show you some examples of um, but essentially we need to choose how how is this device going to work, how how what kind of model is there going to be for user interaction with this device. Uh once we've chosen a a concept for it, we can then design the features around the concept, making sure that we get all the essential functions in the device and uh the extra functions and the more advanced features. And of course we also have to make it look cool. So basically, that's what we don't want. M we don't want lots of buttons, uh complicated features. We want something that looks nice and simple. Here's a a fairly simple device. This is an an iPod from Apple. Um I think the main

thing to notice about it is it just has four buttons. It's very minimalistic in its design. Uh you use these four buttons to move around a range of settings on the small L\_C\_D\_ screen. Um the thing I like about this is that it's very very quick to access the main features. Uh you can just about make out uh that the button three buttons are uh previous track, next track and play pause. They're the main the main features of the iPod, the things you will use a all the time. Um then if you want to do anything more advanced, you go into the little menu on the L\_C\_D\_ screen and you use the buttons just to scroll around and and find the more advanced features that you want. So I think that's that's a good a good kind of model that we could have. Um here's a another example. This is uh it's an interesting idea and I think i it looks pretty cool. Um it's certainly got novelty value. Uh it's nice and colourful, it's nice and bright. Uh it's also something that you can kind of feel your way around. The buttons are are different shapes and and you can sort of yeah if you're watching T\_V\_ in the dark or whatever, you can work out which button's which and basically, yeah it's ith it's fun. So I I like I like this idea of just having buttons for the features that you use most often. So you'd need a few buttons to select your favourite channels. I mean most people, when they watch T\_V\_, they have two hundred and fifty channels on their T\_V\_ and they watch of 'bout four of them at the most. So, you have buttons for your favourite channel, changing the volume, which is something you do all the time when you're watching T\_V\_, and the button to switch it off, in case you get bored. Um other features, things like adjusting the brightness, tuning the T\_V\_, uh I don't know what else you do with a T\_V\_. Um but these are these are all necessary functions. Uh you can't have a t there's no point having a television that you can't tune or that you can't set the contrast, so we need to find a way of including these somehow. Um and one other suggestions I'd make is to in is to include in a menu system, a bit like on the iPod. So we'd either have a small L\_C\_D\_ display on the device itself, or uh have a dis a menu display that comes up on your television and can b be controlled through the device. And that would allow you to access access the advanced features uh whilst keeping a very small and simple set of buttons for the features that you use most often. I think that's that's one way to go, yes. Um I mean there are there are advantages and disadvantages

ges if you if you have an L\_C\_D\_ display, it's it's nice, because it's it lets you just sort of sit there and st and control your television from your armchair. There are disadvantages, an an L\_C\_D\_ display would have to be quite small, 'cause we're we're I well we're I assume we're gonna be making quite a small device. Um it would also have to have uh a kind of backlighting in it, 'cause you ten you tend to watch T\_V\_ in the dark, but you need to be able to see your L\_D\_D\_ L\_C\_D\_ display. The alternative is to have a an on-screen display on your television that you control through your remote control. Uh a bit like a bit like how they have these um digital boxes where you you press the buttons and it comes up with your this thing of watch lo what's on each channel. I mean that that's also a good idea. It's it can it does have it's problems as well, if you've got a small T\_V\_ and you're sitting on the other side of a room, it's hard to read the little text that comes up. Uh but that's a that's a design decision that we can make. Yeah. Yeah. Yeah, that that would be one of the features, yes. But it's it's it's something to bear in mind is that if we put a display on the remote control the c uh communication is one way, so you can't have the televisions and information back to the remote control, at least I don't think you can. Um I'm not sure. Is that going on? Okay. Uh that should be alright, actually. A kind of thing that Yeah. Yeah. Yeah. Is it supposed to be shaped like a vegetable? Uh like uh I dunno, like uh carrots or something. Maybe, or Kind of like a potato. Yeah. Depends. When you when you use a remote, do you press the buttons with your thumb, usually? Or your fingers? Or maybe you want something that's shaped like a mobile phone, so you you hold it in one hand, and you press the buttons with your thumb. Yeah.

Maybe. But if you've only got like four or five buttons anyway, then it's it's not so much a problem, perhaps. So you hold it in one hand and you press you press the buttons with your thumb and And you find that works quite well? Is that The button on an iPod, is it what is it, is it just four buttons or is it li more like a scroll thing? Right. Oh, I see, right, yeah. Oh, okay. Yeah, that's quite a good design. Yeah. I think it could be difficult in practice, yeah. Also z yeah, 'cause you would be z looking down at the L\_C\_D\_ screen, than back up at your T\_V\_ and people don't wanna do that. Like, to make it different fruits. Yeah, it's possible. I think maybe th the packaging, it should be like a lemon and the the packaging is like the peel. So instead of opening the box you just kind of peel it, and the remote control's inside. Don't know. Yeah, um I think it's good, as as long as we consider the the cost and the uh how reliable it is, but as far as I know, the technology is good. Al all circuit boards are pretty much the same, I think. Uh it's fairly fairly standard. Um I don't think we ne really need the scroll whe wheel. I mean it might be nice for changing the volume. Uh but I don't think it would really work. Yeah, you really need buttons for changing a channel. Yeah. Yeah. Yeah. I think yeah, I think a scroll wheel would be nice, but it's not necessary. Um Yeah. 'Kay. Yeah. Yeah. Yeah. Um Yep. Um And I think if we wanna keep our costs down, we should just go for pushbuttons, 'cause then we can have a a simple chip and it's simpler, it's it's cheaper to make pushbuttons than it is a scroll button. So in terms of uh in terms of uh economics it's probably better to have pushbuttons. Yeah, yeah, it's uh it's it's fairly simple. Yeah. Yeah. Interesting. Yep. Uh what do you mean by supplements, exactly? Um Yep. Yeah. Um in Yeah. On off, uh volume, favourite channels, uh and menu. Yeah, yeah about yeah like yeah, a bit like radio presets. Um Uh we wouldn't even need the numbers. I think maybe numbers seems is kind of old-fashioned. Yeah, yeah, you can just and you need some kind of, I dunno, sort of up d

own kind of button, but the volume control could double for that, for example. Cool. Yep. Clay. I wasn't expecting that. Mm yeah. Okay. That would be me. Alright. Well. Alright. Um I'm very excited by this one actually guys I uh had a lot of fun doing it. Components design. This is where you look at what does it take to make a remote control and what should we make our specific remote control out of. Um. So, we need to examine each element separately, but we're designing a full thing, so you wanna keep it integrated as a whole. The main elements of remote controls in general, and therefore ours as well, are the case, the buttons, the circuit board with the chip and the battery. These are all things that we had sort of addressed before, but I'm gonna take each one a little bit separately here as we figure out what they should be made of and what they should look like. The case, uh the options that I've gotten from headquarters about what we can do, um there's there's the shape of a case, we could do a flat sh a flat case, a curved case or maybe even a double double-curved case. I haven't seen any pictures of what this exactly looks like yet, just keep that in mind, but these are the options that we have from manufacturing and we can make our case out of plastic, the m the main base will be plastic, but we have all these sort of fashion and technological elements we can add in, wood, latex, titanium, rubber or other coloured types of plastic. That would be our case. Um buttons, for buttons we have um pushbuttons, which is what Real Reaction uses the most often, but we also have scror scroll wheels, which can have integrated pushbuttons, or we could go all high-tech and have an L\_ L\_C\_D\_ screen. Um circuit board and chip we can have a simple one, a regular one or an advanced one, depending on what our other needs are. And then battery I think is where things get most exciting. We're talking about long-life batteries here. Um we can we can have your sort of basic double A\_ batteries, but we also have these options of um using a kinetic battery, like are used in high-tech watches, where you just have to move it a little bit to get it to power up. Um so simple movements like pushing buttons would recharge the battery. Or a solar battery, although there are slight um complications with solar batteries

as in we can't use a latex case if we have a solar battery. Or um something they only described as the type of battery you find in torches from about fifty years ago, flashlights. Not quite sure what that is, but that's the description that I received, so that's what I'm passing on to you. So those are our options. Um personal preferences that I was thinking through here's what we've been talking about all through, fashion and simplicity. So if we're going for fashion in our cases, I think that what we're gonna wanna look at is a curved or a double-curved case, probably with a variety of design elements. Maybe titanium, maybe some wood. We're gonna have to investigate that better when I get specifics of the actual materials, but that's sort of what I have in mind. And we wanna go for simplicity. Probably pushbuttons, but I'm sort of intrigued by the idea of a scroll scroll wheel, if anyone has anything any ideas on that? I mean I know the iPods and things right now have touch scroll um buttons which are exactly like what they're describing, so that might be something we wanna look into. And I'm really intrigued by the idea of a kinetic battery. Solar I don't think would be such a good idea, because how often are you sure that your remote control will get a certain amount of light. But this idea of the kinetic, that you don't have to replace, and that a simple just shaking it around will make it work, I think that that would be a very interesting thing. But I think we'd also wanna go for a simple chip or regular chip to keep our costs down. Uh we really only need a regular or advanced chip if we're gonna start using an L\_C\_D\_. So I

think we want to be aware of not making things overly technological if they don't need to be, 'cause that'll keep our manufacturing price way down. That's what I have for options. Um I'd appreciate anyone's input, but that's what I'm seeing for the future of the the look of this thing. I'm not sure. I haven't received any specific visuals of this yet. This is what I'm sort of Yeah. I'm not sure, but I'll let you know as soon as I get any pictures. I know if we do have a double-curved case, it can't have any titanium in it. But the titanium, they were quite they're marketing quite hard to us as being used in the space programme, so that could be quite interesting. Space-age remote. Just all things to keep in mind. Yeah. That's about all I have to do, guys. I hope I didn't go through that too quickly. Yeah, n no idea, no idea. Um I'm assuming that a kinetic battery isn't gonna take up that much weight, and that a titanium is very light, I know, um but other than that's really basic, I mean, that's all I have gotten so far. Alright? Any other questions? No? Okay. I have save this in the uh shared projects, if anyone wants to look and I have considerable notes on the topic as well, if anyone needs any more information. Uh Just in my notebook, but if anyone has any specific questions, don't hesitate to email me or something. Alright? Uh I guess I can I know. G oh, geez. Hmm. Hmm. So you'd be advocating an L\_C\_D\_ then? Okay. Mm-hmm. Right. Right. Okay. Mm-hmm. 'Kay. Well Are you are you tak Yeah. No, I think I think we're talking menu like contrast and tuning the V\_C\_R\_ or something if I've understood you correctly, rather than menu as what's on. Oh, good point. Yeah. No signal. Oop, there we go. Okay. Mm. That there's all kinds of scope for imagination in that one though. If it's latex if it's latexy Um, mean An uh I if th my understanding of a latex case is that it's in fact hard to protect stuff inside, but that it's covered with the latex, which is spongier and softer on your hands. It's there's something to be said, I mean we we got that thing earlier from you about um not wanting it to R\_ R\_ repetitive stress injuries and things and and Yeah, something grippable, I mean we don't we don't we don't wanna go spongy, maybe. Yeah. Mm-hmm. Yeah, I think that given the list of materials I w I was forwarded it's that seems doable. could we go in fruit and vegetable colours? We could colour-co-ordinate them, li The buttons could be fruit-shaped. Oh well it's quite easy to s shape thing like carrot isn't it? Or maybe the buttons could be shaped like different fruits. be yeah. It'd be harder to f bu uh buttons I think. It'd be harder to press button. Um I Yeah, that's ts how I tend to do it. No just thumb-sized. Jus Yeah. That's true. Right. I

When I'm when I'm pressing buttons on my iPod, that's how I do it, hold it and press the four. Yeah. Yeah, or in and use my thumb or my pointer finger on the touch scroll wheel. Yeah It wel well yeah, it would I mean each version of it has been a little bit different, but Oh yeah, you had one of the in-between ones, when they weren't doing that anymore. Ts and you press the centre button, that's that's your all-purpose select button right there. Since it's the one in the centre that's not marked, yeah. Yeah. Uh uh t Yeah. Hmm. Yeah. Yeah, I think an L\_C\_D\_ screen might be good in theory, but not as useful in practice. Yeah. Right. Um Oh we probably have to get going, don't we? 'Kay. Could Could we uh could we have changeable covers like for your mobile? In different fruit and vegetable colours, yeah. Exactly. And you could co-ordinate with your house or whatever. All these options. Ooh. Oh. Yeah. Mm. Options. Uh-hu oh, oh yes. Right, I had sort of skipped over that hoping it wouldn't get be necessary but um Alright, so um decisions, what the okay deci decisions on energy I'm thinking is based on the battery. Um I dunno, what do people think about this kinetic battery idea? Am I Yeah. Yeah

. Right, I haven't gotten any yeah, any more information on cost other than it's more expensive than a regular battery, but um but if we're using a an i a cheaper chip, then it'll even out, I think. Um circuit boards. Um yeah, I got a whole bunch of information on how circuit boards are produced. They're they're thin fibreglass with copper wires etched on to them, and di I think they're quite easily printed on by machine, which is chip on print is where the machine prints on the wires and solders it all together for us. I don't really know what to tell you as far as decisions. I wasn't really given any options, I was just given that this is how they're done. Um yeah, I can't can't really tell you. I can I can tell you a whole lot about how it works. But I don't know any decisions on Yeah. I'm sorry, I did f Yeah. Right. Well okay, here's the here's the thing on the chips that I that I got. Um simple, regular, advanced chip on print. The chip on print includes an infrared sensor, so we don't have to worry about that. Um, 'kay, the pushbutton if we're gonna have pushbuttons, they require a simple chip, but a scroll wheel requires a regular chip, and an L\_C\_D\_ requires advanced. Do we want a scroll wheel, or do we just want pushbuttons? Oh. Yeah, th it'd be it'd be handy for going through if there was an on-screen menu of your channel choices, than you can scroll down on the scroll. Yeah. Yeah. Yeah. Hmm. F or for all those secret functions? When you get on the on-screen menu of all your functions that your remote could do for you without the buttons and you could have a scroll wheel to go through those menus. Right. So we could either go with a simple or a regular chip, depending and maybe we could table that decision for later. I don't know. Okay. Well, let's think about that while we talk about the case. Uh I'm kinda liking the idea of latex, if if spongy is the in thing. Okay. Uh yeah, everything I've N oh wha what I've what I've seen, just not related to this, but of latex cases before, is that there's uh like a hard plastic inside, and it's just covered with the latex. Not too thick a layer of latex, just enough to be grippable, like bike handles or or anything that you've seen like that. The inside is hard. I don't think we need to worry about protecting the circuit board, I think that that's done for us. Yeah. Yeah. Oh and we want a curved case, yeah? Or a double-curved? Yeah, okay. We don't really know what the difference Good point. Yeah. I say pushbuttons at least unless we get any information but I have no idea how much more expensive a scroll wheel is than than a pushbutton, but it's gotta be some more expensive, so I think it might be better to put our money into the stuff like the kinetic battery and the cool case because Yeah. Oh. Alright. So what are what are our buttons gonna be? On off So like one through five, or No. Mm. Yeah, up down. Ooh. Simple chip. Okay, cool. Clay. Mm-hmm. Okay. I g yeah. Time is it? Okay. Lovely to see you all again. Um it's our conceptual design meeting and it's starting at approximately fourteen twenty five and so we have forty minutes for this one again and so we'll go just after three o'clock. Um okay our agenda, we're gonna do an opening, I'm gonna review the minutes of the last meeting, then

we'll have your three presentations um and then we'll have to make a decision on the remote control concepts, and finally we'll close. So opening. Um these are our minutes from the functional design. We decided our target group is the focus on who can afford it, because we have international appeal and we said it's for all age groups, different um functions of it. Our main objectives were simplicity and fashion. And some specific functions are something to keep the remote from getting lost, large buttons for the essential functions, a possibility for extra functions, like a sliding a sliding piece and a long-life battery or a charging station. Okay, now three presentations. I'd like to do

it in this order, first do the conceptual specification of components, properties and materials um and then the conceptual specification of user interface and finally trend watching. Mm. 'kay. Function F\_ eight it. There we go. Mm. Hmm. Mm. Yeah, I wonder Mm-hmm. Just an interesting marketing kind of element. Uh just a real quick question um the weight of these different elements, have you no idea, okay. Mm-hmm. Mm-hmm. Okay. Mm 'kay. Thank you, perfect. Um if you made notes yourself you can put those on our um underneath our oh, uh in your book, then don't worry about that. 'Kay now we're um concepts concepts of user interface. Yeah, um. This one's so much tighter than the other one. Okay. Nope. There we go. Here you are. Mm. Okay. Mm-hmm. Mm-hmm. Mm. I do think that um one of the important features for a remote is seeing a menu and seeing what's on. Um and so like favourite channels is applicable, but I think that you do need to have some kind of function where it's um you have to you can see the title of the show or possibly a description of it. Like I know I use that often enough. Well if it if it was a L\_ L\_ C\_ D\_ on the remote, I don't know that you could find that you'd be able to see a Okay. Okay. 'Cause that would be more specifically a digital box, mm-hmm. Mm. Okay, now we're moving on to market. Marketing. Eight. Oops, it's not plugged in, quite in well enough. There we are. Mm 'kay. S sweet. Okay, do we have any some questions for this, let's see um. Um do you have any ideas how to possibly use these? Um how to how to use a fruit or vegetable or um or the spongy material at all? Like could we make a s like could we make a spongy remote? It would be easier on the hands. It's kind of and then it we would have to find a way to protect like the chip and all that, I dunno. But Mm-hmm. Mm-hmm. Mm-hmm. For sure, or maybe like um couple main ones being like, I dunno, lemons or strawberries or something. Could they be smelly? I don't know. Or carrot shaped, mm. Like large button, that's what I was thinking of, yeah. Might would you think you you do you think you'd be able to hold it? 'Cause I think the reason they're long is yeah. Harder to push. I usually hold it in one hand. Maybe But then the buttons would have to be very small. Don't you think? But I mean in order to get to all of them, you know. They would have to be within a certain amount of space with each other. Mm-hmm. Mm-hmm. Mm-hmm. It's a scroll, yeah, it's a wheel. The one I have doesn't have the four on it like around it, I don't think. Mm. Okay um we have we've about fifteen minutes left, so I'm I'm gonna continue with my presentation. Um I've one more slide before we close, but in that slide is when we need to make decisions about this these kinds of things, so I'll just bring that up and show you all before we move on. Um Yeah, and then like the the covers could be spongy latex wherea but the actual model could be titanium. Ah hmm hmm hmm. Okay, um components concept. Energy, chip on print. G That's this is the agenda they gave me. So can you just explain what that is real quick? Mm-hmm. I think it's awesome. I think it's really cool. Okay. If they're if they're really options. Okay. Um okay, then we'll move on to the case. Um oh but I guess maybe if we decided on like a simple, a regular, or an advanced chip, maybe. It would be nice for changing the volume, but I don't know how useful it'd be for changing the channel. 'Cause you don't have control over numbers or We have five minutes left for the meeting, so. So, have a scroll for volume? F Um. I think well I think when we go on to the user interface, we're gonna have to decide the interface we're gonna have to decide um whether we're

gonna have a scroll or not. Okay, let's do case. I'm a little um I'm a little hesitant about it, because I'm worried about protecting the stuff on the inside. Um Yeah, I would be more okay with like a titanium actual thing and then maybe like a mobile p

hone kind of thing. Mm-hmm. Okay. Mm-hmm. Okay. Ge o Okay. So we uh we do want latex. Okay. Latex. Um and probably in colours, maybe fruity, vegetable colours. Fruity colours. Okay um let's go to the ufe user interface then we'll come back to the chip I suppose. Well, we don't really know what the difference is, right? Yeah. Um okay, interface, the type and the supplements. So push or scroll, right? Or both? Mm-hmm. And if we had a sc an on-screen um kind of thing that you could scroll through, like you can use your buttons to scroll through things. I think that yeah. For channel surfing I think a scroll an actual like an iPod's kind of scroll thing would be too fast, I dunno. Mm-hmm. Is that okay with you? How you feeling? Mm-hmm. It might be cool enough. Okay, so we're gonna go with um type pushbuttons, and then supplements, how are we gonna do that? Um I assume that's what else we're gonna like h ha the um the additional buttons we can use. So we're gonna have like a menu button, so that we can access on-screen things then? Okay, um so we're doing an on-screen menu that we can scroll through. Pre-set channels and then we're gonna need um numbers one through zero, right? Well, but in order to pre-set a cha oh I guess you can just hold it down when you get to one when you're scrolling through. Mm-hmm. Okay, um finishing the meeting now. Um our next meeting starts in thirty minutes, um you each have things to do, look and feel design, user interface design, product evaluation, and you two are going to work together on a prototype using modelling clay. You'll get specific instructions from your personal coach. Um did we decide on a chip? Let's go with a simple chip? Okay. We are done. Thank you everyone. Oh I di these are already in our shared folder, so. Fourteen twenty six. Is double-curved like would be like two hands kind of thing? Okay. 'Cause I'm imagining like double-curved is like, you know, like two sides that curve and then like one curve would just be like a single vertical-ish kind of looking thing, but I've no idea. Sounds good. Thanks. Wait, but is that separate from what he was saying? Should I plug that in? Maybe it's just not Is it on? Ri What F\_ do you have to press, five? I just keep pressing lots of 'em. Well, I don't know how relevant all of this gonna be. If anything, the that they gave me. Alright. Oh yeah. Okay, so we're gonna look a little bit at trend watching. Basically, I was given um an executive summary that was a market investigation on remote controls that was recently conducted, and then also some fashion watchers in Paris and Milan commented on some things that are gonna be going on this year. So first um they had people they ranked um the important aspects of r remote controls, and right now i d they're saying that currently there's a functional look and feel preference, but that really, over the next year it it that's gonna be switching to fancy look and feel remotes, so that just goes back to the whole desire of our c Real Reaction company wanting to focus on fashion and so, even though we're stressing, when we're talking, we've all been talking about this like simplicity and easy to use idea, they're sort of wanting us to remember that the number one thing for everyone is that it's fancy look and feel. And as these are ranked, the top one is doubly important to the second one, which is doubly important to the third one, so just to take that weight into account. The second thing that was mentioned as important was the technological innovations. That would be like if we use something like the space material or the L\_C\_D\_ screen, things like that. And then ease of use was the third most important, whi so really, no matter what, we need to focus the most on fancy look and feel, according to this. I don't know how much we agree with that. And then the fashion watch talks about that this year's top trend for clothes, shoes and furniture is fruits and vegetables and tha that there's a preference f

or spongy, tight material. And so that brings us to my personal preferences. Who wants a spongy remote or one with fruit and vegetable padding. Personally, I don't really think that I want one that's gonna go out of style or go stale, excuse the pun, um in a year, so even though this is coming from us as, you know, trend watch, market research, I don't know how much of it we necessarily wanna take away. Also, considering that the d research b has been carried out by Real Reaction, I'm a little hesitant as to like, how these questions may have been worded, and if necessarily this whole fashion to technology y edas ease of use is necessarily the right ranking. Personally, like I might reverse it, but if we're working for this company then I guess no matter what, we have to stress fashion the most. But it doesn't necessarily need to be a spongy material. Yeah. I don't have a lot of notes to share if you want them, that pretty much sums it up. So yeah. Yeah, what can I possibly enlighten on? Mm-hmm. Yeah, so something, m m instead of a necess yeah, grip, I'm thinking grip more than like sinking into your hands, you know, i and I think I'm envisioning more like, you know, the material that you have when you sit on like a bicycle, so that it doesn't hurt when you're sitting down for a long time, like I'm imagining that sort of thing, I don't know what th that material's called. Oh God. What about the idea of like a round remote? Instead of like a vertical up and down one. Like in terms of holding it. Like that's a f shape of a fruit. Just to tie it in a little. Yeah. Yeah, 'cause otherwise your fingers can't move around. But I like i I love the idea of the wheel like the iPod. 'Cause th It's like five, 'cause there's one in the middle. I think why it would be good for us is 'cause like you could have the same wheel sort of effect for like channel flipping and then the other one could be like for volume. Like just the idea of like those so few buttons for main things, but then how you could go back to the menu and like, I dunno if we would want it on the screen there or on the actual T\_V\_. I kind of am wanting to say on the T\_V\_, 'cause if you're changing the brightness, don't you wanna see it happening, kind of? And then you could still have that available. Mm-hmm. Mm-hmm. Uh-huh. If I get any more information of fruits and vegetables, I'll let you know. Well, there we go. The iPod packaging is me like was so that was like half the fun. It's like the way it all comes all cute. Lemons? Yeah, I mean, it would t totally take care of our problem of not wanting to change batteries. Costs. But over time Yeah, it's a But if you c if you could scroll through the channels, and then the volume would just be and the volume would just be like the same way, forward and backward as I'm just thinking like it would make it much like sleeker sort of looking. And otherwise, no matter how may buttons we have, we're gonna have like, you know, black with red sticking out and th no it's gonna inevitably sort of start looking like those group of sort of ugly ones that we saw stacked up. Oh could it be hard, and then something around it? I'm thinking curved of some sort. Yeah. And let's like see if we get anything else. I mean I'm not like hard-sold on the scroll wheel, it's more just to give it a different kind of look, but if it's gonna be in a latex type thing and that's gonna look cool, then that's probably gonna have a bigger impact than the scroll wheel. Like a radio type sorta situation? Wow.

---

# Meeting ID: 46

Data Source: Train

## Executive Summary

Then the project manager opens the meeting announcing that they will address conceptual design and then giving the agenda. Matthew arrives late and the marketing expert begins her presentation about trends. She emphasizes that the remote needs to be exciting, contain a cool feature, and be somewhat intuitive. She reports that currently fruits and vegetables are fashionable- thus bright eye-catching colors, bold designs, and a spongy feel is appropriate. She lists ideas such as changable covers, a locator, speech recognition, and LCD screens. The industrial specialist presents, talking about how a remote typically has different keys, structures and forms. He likes the idea of implenting speech recognition into a universal remote. They discuss without certainty about the cost of such functions. The industrial designer presents about remote control components and the manufacturing process, listing options such as various buttons, scroll wheels, integrated push buttons like those in a computer mouse, and LCDs. They discuss the project budget and the possibility of using an expensive chip. They decide to make two designs, one more advanced than the other. The project manager closes the meeting by telling each group member what his/her tasks will be until the next meeting.

## Complete Meeting Transcript

Right first time this time. Nu There we go. It's not that complicated, but I get it wrong every time. For Matthew, yep. Mm-hmm. Mm-hmm. Mm-hmm. Yep. Mm-hmm. I have a presentation, I'm just making this Okay I'll just email you this file, my presentation. Mm-hmm I'm just emailing it to you. Okay it should've gone through to you. Mm-hmm. Okay so this is just a presentation on uh the trends that we're gonna use to make the product stand out from the rest of the products out there at the moment. Um can I just put this on? So we have to work out a way what we can do with our product to make it stand out and make it so people wanna buy it. Um. This is to do this I will not remove my microphone. We basically used um some focus group surveys which I went through with you last time, the main results of that, and um some research on the current design um and fashion trends that are out there at the moment um, and as part of this The important aspects that came out were things that we've already

discussed really. The most important by far was the look and feel of it. It needs to be something that's very different from everything else out there. It needs to stand out. It needs to be not functional like the rest of the things out there at the moment. Most people find remote controls boring at the moment, we need to have something that looks interesting, that looks exciting, that will stand out. People will wanna buy it. Um That was twice as important as the next item on here which is that it has to be technologically innovative has to have something else, apart from just the look of it. People have to then think about it and say got something there that I want. That's a really cool feature, and it has to make them wanna buy it again. Third on the list, and again innovative was twice as important as this last um aspect, it has to be easy to use. So they have to be able to be able to look at it and have some intuitive idea of how to use it um. Drawing on the fashion trends at the moment, uh fruit and vegetables um. This is basically talking about just the the feel of it, so probably not the smell of it, but the bright colours, um eye-catching, really bold designs, and a spongy feel. Um I had a talk to the design people about this, but having a remote that's tactile, that feels different, that would be really cool. That would make it stand out. Um. Well ma make it not necessar sp spongy is the current thing. Spongy is the current texture, but basically there are no reports no remotes at the moment which are spongy or tactile at all, so if we make it like maybe furry or soft or something, that'll be something that sets it apart, rather than just bare plastic which they all are at the moment. So as far as the design goes, the very most important aspect was the design, to the customers. So going with the fruit and vegetable idea, we've got the bright colours, so makes it stand out, the oranges and the the bright yellows and the florescent colours, part of the fruit and vegetables um. Going back to the idea of taking inspiration from mobile phones, they've all got those a lot of them have the changeable covers, so they can choose what colour the outside is. That's one way of looking at it um. Textured feel we just talked about. Maybe it's another way of doing that. So if it's part of the the changeable covers then may maybe they can choose a different texture, a spongy one or a soft one or something like that. So they can choose it li as they want to to maybe to fit in with their decor in their living room, or just what they like, their sports team or whatever. Um and yeah, still taking the inspiration from the mobile phone design so functionality, the way the mobile phones work, the way the keypad looks. Also just the way that a lot of industrial design is going into mobile phones at the moment. They're big selling items. People put a lot of thought into that so we can leverage off that, and we can start using some of their ideas. Um back to te

chnological in in innovation, not quite as important, but still a big issue. Um we talked about having a way of finding a remote control if it's been lost, uh that's one thing we could look at. There are other aspects like L\_C\_D\_ screens and speech recognition which weren't I don't think, in my personal opinion, gonna be worth the extra expense and the extra effort that will go into them. I think we're better doing something basic like this which is very important and very will be a really cool feature to put in. And use. I had no real specific ideas for this, maybe we just, the basic idea of having your core functions big and at the top maybe, by themselves, and then yeah and then th th the finer details of buttons you don't use as much either hidden away or completely separate. Yep and that's the presentation. So does anyone have any comments or ideas on that? I think you Hmm. Well we're selling so many units of this. This is gonna be a mass marketed product, we can afford to have two or three different designs at least. Mm mm. Mm. Mm. Mm-hmm. Mm. Mm-hmm, yeah. Mm-hmm. Mm-hmm. Mm. Mm. Mm. I like the idea though of having speech recognition for like the n the name of a channel like B\_B\_C\_, rather than having to remember the the number of it on the keypad. That's a good idea. Mm. Hmm. Mm. Yeah I really like that idea. Mm-hmm. Mm. Maybe ten channels, yeah at the most. Mm. Mm-hmm. Mm. Mm. Mm-hmm. Mm b But a coffee machine, there's not too many words

they'd be using with that it's a it's a small vocabulary. Mm. Mm. Mm. Mm. Two thirty five supposed to finish. Hmm. Hmm. Mm. Yeah. Mm. I think you can do it both ways. You can have it so it's easy they can pick it up and use it straight away without doing anythi without customizing it, or if they want to they have the option of using these extra features. Hmm. Hmm. Hmm. Mm. Hmm. Mm. Hmm. Mm. Hmm. I like the idea too of being able to use the remote in the dark, so either having the buttons so you can feel the difference between them or if they if they light up or something. Mm. Mm. Hmm. Mm. Hmm. Mm. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Mm just have a yeah Just the veneer on it, yeah. Hmm. Mm. Mm-hmm. Well maybe we need specific costings then. Actually do maybe two designs and then cost them out and see which one is gonna fit in our budget better. Mm. Mm. Hmm. Mm yeah sure. Mm-hmm. Mm. Mm. Mm. So is there any of these that you're looking at particularly or is this just ideas? Mm-hmm. Hmm. Mm. Mm. Mm yeah. You see? Yeah. Mm well one I've had before, a r r remote control we have at home is one that's actually got a cover on the bottom so the bottom bit is just, covers half the keys most of the time, and then you can slide the cover back to get to the the more advanced keys. Mm. Mm. Yeah. Um yeah I've seen that before too. Anoth another like b it flips up and then you've got another layer of buttons underneath. Mm. But I've seen also with keys and buttons on the top of here as well. I like this one. I like the shape of this one. Can we have can we think about maybe having a a non-recta non non-rectangular one, so with not just the straight little box that's a maybe curved or something. Mm mm 'kay. Is this for the next meeting though? I think we might be out of time out of time for this meeting. Yep. No. So is this is there anything else I need to do from a marketing point of view for the next meeting? Mm. Okay well is this me designing a way to evaluate it so Thinking about how to set up test groups and things? Mm. Okay. Yep. Mm. Hmm. Mm-hmm. Mm 'kay. Thanks guys. Okay so we are just waiting for Matthew. Mm 'kay. Yep. Mm-hmm. Yeah I think yeah the Matthew it is it's important that Matthew yeah is here because it's really a a team uh project with a team and if someone is not here then we cannot but it's okay it's good. Mm-hmm. So can you repeat and be more precise about what you just said? Uh about the feeling yeah uh yo Okay. Yeah. Yeah that's a very good idea, yeah. Yeah. Mm-hmm. Yeah very clear.

To let the people choose, you mean? Yeah. Yeah a range of uh yeah, a set of three, four different aspects. Sure that fits the Yeah. Yeah yeah I agree. Yeah. And your part is very related to mine because when you suggest something then it has to be integrated inside. Yeah.. Yeah. So what functionalities do you suggest for that? For facing this problem? Okay. Mm-hmm. Oh yeah yeah yeah mm. Mm. Mm-hmm. Yeah. And you want okay for coming back to one point y you want to let the user to programming the keys? Some of them? And uh isn't that too difficult for the we want w I don't know if we still want the um R\_C\_ to be easy to use, that's the compromise. Yeah. Yeah. Yeah. A standard. Yeah. Yeah. Yeah. Mm-hmm yeah like I would say that for programming uh keys, you said, uh it could be uh easily uh done within the the package of twel twelve Euros, but for the A\_S\_R\_ system, uh I'm not sure if it's feasible to have this or We Exactly yeah i if it's a low vocabulary it's already implemented, and w how much it's cost, maybe with a f cheap chip. Yeah. Yeah. Yeah. Mm. It's true. Mm-hmm.. I don't know how if I have time to talk about the Okay. So what I'm gonna present here is very uh um yeah basic knowledge about the all the the components that are inside a a R\_C\_ a remote control, and how is it manufactured h what is the process, just to explain you. So the method is ther there is a a set of components in a in a remote control like, and uh what cost the the components in themself do not cost a lot but the the way to assemble everything costs obviously, and I will uh show you my preferences uh uh at the end. So there are two uh different types of uh um Two different ways of using the the components for making a a remote control. Uh the basic way is to use a an integrated

circuit and some uh transistors with an that aims at communicating uh uh the message and to to send the message to the um to the led that will uh transmit to the receiver. And uh yeah the other components and the circuit board buttons, infrared, led, etcetera, for the components um. So you finding, just to say that the chip can detect uh when a key is pressed, and then it translate to the key, to a sequence, something like morse code, as you know, uh with a different sequence for each key, and uh uh that's, with the components we will use, we will have different uh messages, different sequences, and the chips sends that signal signal to the transistor that amplify to make it stronger um. So electronic parts are assembled onto uh printed boards uh because it's easier to mass produce and assemble. And uh so I think for our design we want some b uh programmable uh you know V\_V\_L\_S\_I\_ or F\_P\_G\_A\_ uh high technology, and this is important, and also we'll use uh yeah like in any uh high-tech uh devices a chip of fi fibreglass to them and connect them. So my personal design we need to find a solution what um what is the material of the cover we want to use. If it's plastic or you said that yeah you had some ideas uh like fruit, veg or I dunno. Yes. Yes. Yes. Yeah like they do in with cars I think. Yeah inside the car yeah. So they also emailed me that uh they have available a bunch of different buttons, a scroll wheels, integrated push buttons s such as a computer mouse. And uh very cheap L\_C\_D\_s, so liquid crystal displays, so I'm wondering, I think we might be able to integrate L\_C\_D\_ into our R\_C\_. And the final point okay is um we have yeah there are some uh compromise to to do. So we have to know that the push button requires a simple chip, but the scroll wheel uh and that kind of higher high-tech stuff needs more money um which is a higher price range alright. And the display requires an advanced chip, which in turns is more expensive than the regular chip, but I think uh with twelve Euros um and if it's uh uh made for mm four million uh items, then I think w we could be able to handle that. So to to sum up um we need yeah so I I just said that the components uh the li

st of components uh has to be uh yeah listed and um and um assembly is a an important process that has to be taken into account. And uh for the designing of the cove uh uh cover layout then it's better to to to maybe see that with uh the the U\_R\_ exp U\_R\_I\_ Expert so that we can it's really a team-working uh. So I I cannot design something without your agreement, right? Yes. Yeah it's kind of um simple pro progra programmable device, and we have to insert. I think we could insert one that could underlie several functions of Exactly yeah, for customizing and yeah. Okay. Yeah. Yeah good idea. Yeah. Exactly yeah that's a very good idea, we could have uh one main chip uh that could handle, uh it's called F\_P\_G\_A\_ chip, that could handle both uh like scrolling wheels as well as uh L\_C\_D\_ and yeah. Yes. Yeah also thinking, I think both uh if we had a budget of twenty twenty uh Euros, it will be okay, but uh. Yeah that's an excellent idea. Yeah yeah. Yeah because right now I don't have price in in head but for next meeting I'm sure yeah be able to do that. Yeah. Okay. I agree on that. Yeah. Yeah but i it's a detailed uh yeah yeah uh plastic versus uh wood, and we need maybe to centre our description on uh the the really the what buttons what uh functionality we want to offer to the user, and maybe with uh graphs or I don't know uh User Interface Designer you could maybe uh help us on that. Yeah. Perfect yeah. Yeah. Yeah customized. Yeah. I agree yeah, and not too m too many keys of course yeah. Yeah. Mm. That's what you mean? Yeah I like also this one. Yeah, the point is w maybe we need to also to make a decision on how how how big we want to be and how many buttons like n we should dec decide numbers or Okay. Yeah yeah yeah. Perfect. Exactly. Yeah. Two or three prototypes? Two? Okay. Yeah and find maybe a compromise. Perfect yeah. Thanks. Mm. Uh So I suggest we start the meeting uh without Matthew uh he's uh obviously late for some reason. Good. Um. Today uh we will uh talk about uh conceptual design. I hope uh you both did some uh some work uh concerning a uh conceptual design. Um this will be the uh agenda for the meeting uh. Uh I will take some minutes uh again. Um we

will have the presentations of y of you different team members, and then try to come to decisions uh about the concepts uh you have presented. So and that uh will uh we have some uh forty minutes uh to complete this uh. So um who has the fir do you ha Anna do you have your presentation ready? Okay. Ah there is Matthew. So. Good. Do presentation ready? Oh okay. So did you manage uh Oh yes I see him, good yes. No. Okay mm yes I have it. Mm. Mm. Hmm. Spongy feel? Mm. Okay. Mm-hmm. Mm. Yes well maybe Matthew can can give some more information on the Mm. Okay good, that's very clear. 'Kay. Um. Uh Maybe we yes well we maybe can decide later on um the l the the look and feel of uh I've it was a good idea maybe to to Yes the the the there are changeable covers, but on the other hand I I don't know whether my superiors would be so glad with it because you have to introduce a complete uh uh new l line of uh of supplies uh it would be uh very complicated uh organisational Hmm. Mm-hmm. Yes. Mm-hmm. Yes and of course it will be a we we get a if it works we can get uh after-sales I mean that would would be very good I mean those covers could go for for three, five Euro. That's a very good idea um And then uh maybe uh we can go a th Matthew's presentation because the Together indeed uh, because you ma might have some some information on the the easy to use, what you were already mentioning. Um yes but but I do maybe you can give a hand to us because I I'm not sure whether that that we can implement that for twelve Euro and fifty cents. I'm sorry to have Every time I have to come down on this price again to so this might be a little limiting for your creativity, but it's it's it's the real We have to consider it. S so do we think these ideas an and my uh sp speech recognition, I me

an maybe it's possible for for twelve Euro but then then it will be at cost of other functionality we might implement like the uh uh the the the furry uh uh case of the Mm. Mm mm. Hmm. Hmm. Mm. 'Kay good. Mm yes um I would Yes yes you can you can still. We have time. Nice. Mm-hmm. Well well m m maybe m maybe we can give the uh the uh the case a very uh uh normal a v very normal case but, with the changeable covers to fancy it up. So like a normal cheap plastic case which can be covered up in, for instance, a wooden case. I mean just what Mm-hmm. Mm. No of course. So So I f I think we we should come to some decisions now uh a about this. Um so I understand uh when we want a display we need a expensive chip, but when we want a scrolling wheel w we also need the expensive chip, so can we use same chip, so with one expensive chip we can uh implement several complicated uh or advanced features. Yes. Mm-hmm. Mm-hmm. So when the more expensive chip you mentioned there is possible in the in the given budget, uh maybe we should go for for the more expensive chip, so all features uh which you mentioned can be implemented based on the same chip. Do you think that's feasible? Uh You th you think it's possible. Hmm. Mm yes wh when you make a a design ca you can next meeting you can give an quite an exact cost price. That w that would be a very good idea. Mm. Good good. Yes but I can I think uh I think we can just use more cheap plastic for a kind of basic edition, and then people can fancy it up with with more expensive materials which which come with a with another price. Do do you agree? Ma I I think uh for next meeting we c you two can present a real design. Uh so drawing it on the board. And then we now sh only have to t to decide the general function uh. So um Let let's say next meeting w you produce two designs, one one one less advanced and one more advanced and with the cost price. Uh furthermore we go for the for the uh basic plastic case which can be later uh fancied up with uh with addit uh additional uh, how do you call them, these like like mobile telephones you can put a cover over it. But that that that that can be done later. We now can concentrate on the on the basic remote control. Um. Mm. Mm-hmm. Yes yes yes bi big keys is is good thing I think. No no. Mm mm mm. Mm w but then you have still have uh when you don't use it you have such a a an extent of your remote control which you don't use. So maybe it's possible uh, I don't know whether you can can indicate this, that you can elsewhere open your remote control and on the inside

are uh buttons you don't use that much. Yes. Yes I I th that's what I mean so I mean something like like a book. Mm. Ju just make two designs, and the we we can decide decide between th those designs. I think that would be a good idea. So anyone uh any questions for now? Um yes I come to that uh uh Yes well m maybe uh, I don't know whether that's possible, maybe you can start evaluating uh their work somehow. I don't know whether that's possible uh in the given time but a as far as possible. So uh you two will be together w working on a o on two prototypes and further instructions will be uh will be sent to you by uh by email. Two. I Mm and then Hmm. Yes okay. Okay let's call this to an end. Sorry. So Yeah I sent you the slides, you didn't see them? Okay.. So 'Kay. You can Yeah. Voila. Yeah. Yeah s then we could discuss later like we can put all ideas together. It should be easier with that. Yeah. So Yeah. Yeah so I'll I'll go with that actually so um Okay so m so then the the idea of uh having a remote is generally you have uh different keys and uh different structures, different forms, and uh they could be like buttons or like and um they could be of uh a varying sizes if you want to to uh basically emphasize a particular key more than the other, and uh maybe like you can have different colours for example having the r red for the on off switching on and off the button. So this this is the g

eneral trend to ha the method they do. So what I have found was that uh currently uh the they are mostly that the T\_V\_, V\_C\_R\_, music system operated ones actually, and they are very specific to each other, but there are some common keys for example if you want to follow the V\_C\_R\_ and if you want to follow the uh g uh s some uh soundtrack on the w w see they have the common thing actually you can have and uh There is also um a speech recognition to store channel information, names, like You can basically if you have a multiple functionality, say T\_V\_, V\_C\_R\_ or something I say it to the T\_V\_ and the T\_V\_, and you can programme the keys if you want to, certain keys are even the channel information. Yeah yeah so you you you can just uh because uh as more and more channels come then you have more and more problems to remember the v v exact channel numbers ex exactly, even if you arrange it by however you arrange it, you still have the problem to remember exactly which channel you want to So it it's like it limited one. In the present market I saw it that says something like they are looking for eighty word thing, eighty word, which shouldn't be th that difficult to implement, like eighty to hundred word. Basically you want you don't want to store all the channels in the remote control, you want to st store your favourite channel. Yeah some ten twelve channel information. You know you don't want to st store all the hundred channel information into that. And uh basically uh it depends like the remote with L\_C\_D\_ display for browsing because you have multiple functionalities for example you are watching a movie, and uh uh you are having a universal remote control and you want to uh you don't know really which functionality is now, so I am using the T\_V\_ so every time I use it, it could be like, for example I can use a simple toggle switch, and a display, so I press it so the display says, okay, I'm in T\_V\_ or D\_V\_D\_ or whatever it is, instead of having three keys separately for four keys, to model the functionalities will increase actually, and for you and you might want you don't want separate keys for all of them. You can't. And uh well there can be children friendly where you can programme your remote so that they they are not allowed uh to browse certain channels which you can block them, and you can operate them. So these are the things presently which are seen in the market scenarios at present. I personally would look at things like having a u universal remote, is uh um is a good idea, like instead of having unusual ones for all of them you can think of having, um with multiple functionality possibly with speech recognition. I got a mail from the the coffee machine interface unit that uh they have uh integrated the s speech recognition into a into the coffee machine, and so if you say hello coffee machine, it say hi Joe, or something like that, you know, and uh Yeah you you won't be using it, so it's a limited vocabulary mm thing, and very isolated word and it's uh it is interesting, and basically

storing the channel through voice or other ways of programming your keys, on the display for the browsing which is again and maybe having something like a blinking thing, like uh it could indicate you're uh it it could indicate what is cal like the uh whether uh you you have enough battery in your in your uh remote, the blinking. At the same time, if it's a dark room, it can be used to locate the remote also or Yeah you can let them to do that. N no but the if you give it d depends on the easiness like the user how much effort he can put. Like for example uh I would like to store in certain way, so if you want to give the full freedom to the user or you want to keep some constraints and let the user use it with that constraint. So it de So So Yeah. Yeah. We well we can still look at we can talk with the coffee unit and you can uh check how much how much they yeah yeah yeah. Maybe we can come we we can talk to them, and we can co

me with that, you know. And also well you can think of having uh since you have a you know something maybe if you added little bit of display, you might need the to che keep checking the battery, so you really need a some kind of indicator, so it could be a blinking option of L\_E\_D\_ it could actually be used to detect also. If it's in a dark room you can basically detect it also. So No actually i if i it is like you know it tells you um, it can be for two purposes, like if you have an L\_C\_D\_ display and all those things it's not going to be the standard remote, which is having uh which need just uh six six volt uh th sorry three volts um of D\_C\_. It may need more actually, so y you you may need to check your battery usage it and then you need that, some functionality to indicate the battery limit. And then if the battery limit is indicated, if it could be ind indicated through a blinking something and it can change the colour depending on your uh how much is the battery, well that is good enough to even locate even if you want to. You know. Yeah so You you have time some more? Yep. Sure you can you know. Hmm. Mm-hmm. Yeah mm mm-hmm. Mm-hmm. Yeah. Yeah. Sorry. Yeah so of course for example uh I wanted to know like if you want to have a a fo if you want to have the L\_C\_D\_ display over there, or if you want to store a programmes with a keys What kind of things you'll need inside your thin inside W wh what W what Okay. Okay. Okay so in that case you can even look at the technology what the mobile phone is trying to use with the card. Yeah where they do all the wi with with them actually. How f cost effective it would be to put that car chip into it and do the programmable things. D well Well I don't know if it'll fit into our cost of twelve point five Euro you know. Is it possible to fit in to that? Sorry. Yeah that's uh that's something which I wanted to ask you also, like what will be the each individually the cost of it. For example if f if you want to put wood I wouldn't suggest for wood uh 'cause it's I think it's m much easier to use a plastic or a rubber rather than wood. It will be much ch much expensive th though it's the most natural thing, but Yeah. Yeah it's uh Yeah we we can give a preference to them, but it is but with plastic or the rubber or whatever it is it's much better with that rather than going for Yeah. Yeah. Yea Okay. Yeah sure. Yeah we will uh Yeah. Uh. Yeah.. Okay. We can give them smooth keys, you know. Smooth keys with bigger s uh So that you know The the problem most of the time we've seen, the keys is that it's small, and every time we have to be very but if i the if we if we go to a different ways of designing those keys, then you can merge them together to Oh you can actually, for example, if you see, they are they are they are quite small over here, and uh now you can, for example, as I was if you make them big, it may change the look of the thing also to the people. At the same time, it is m more uh like it would be more interesting for people who are having this R\_S\_I\_ and all problem. Uh big keys may better for them actually and uh Yeah. Yeah. Yeah. Yes. Yeah so it's something like this, the model here s you can put the keys Yeah. Yeah. Yeah. Yeah, mm. We should make a Yeah that yeah next meeting we should be Yeah that would depend upon us actually. Yeah okay. No no. I don't have. Maybe it would be interesting if you could look um for the cost inventories of other devices, if you're using speech

recognition or something like that. Mm. Two. One for like cost and the one with like higher-end so that then we can be easily comparing them or you know find a compromise between both of them, yeah that's how it is. Yep. Okay. So we are done for now..

---

# Meeting ID: 35

Data Source: Train

## Executive Summary

It's the conceptual design meeting . And a few points of interest in this meeting um are the conceptual specification of components . Uh conceptual specification of design . And also trend-watching . Um but first I'll show you the agenda . Uh first the opening . Then we have three presentations . Uh after that we have to come to a decision on remote control concepts . Then a little uh thing about the last meeting . Uh these are the points um we agreed on . The requirements and the target market . Uh requirements are uh teletext , docking station , audio signal , small screen , with some extras that uh button information . And we are going to use default materials . And we're going to target uh sixty to to eighty year old customers . um I suggest let's get started with the presentations . I'm uh gonna inform you about the trend-watching I've done over the past few days . Um we've done some market research . We distributed some more enquetes , questionnaires . And um besides that um I deployed some trend-watchers to Milan and Paris to well get all of the newest trends . Um most important thing is the fancy design . Um the research indicated that that was by far the most important factor . Um innovativeness was about half as important as the fancy design . By innovativeness this means um functions which are not featured in other remote controls . Um about half of , half as important as the innovativeness was the was easy to use . Um for our um group , we're focusing on the people of sixty to eighty y years old , this is um , these factors are slightly more equal . Uh the older people prefer dark colours . Uh they like recognisable shapes , and familiar material . And our surveys have indicated that especially wood is pretty much the material for older people . Um this leads us to some personal preferences . Uh the remote control and the docking station should uh blend in in the in the room . Um so this would mean no uh eye-catching designs . Just keep it simple the docking station and small screen would be our main points of interest , because this would be the . These would uh be the innovativeness in the remote control . Um well the trend-watchers I consulted advised that it b should be , the remote control and the docking station should be telephone-shaped . So you could imagine that uh the remote control will be standing up straight in the docking station . This is pretty much a new shape to uh older people . So they would prefer uh a design where the remote control just lies flat in the docking station . Um besides that we would advise um to bring two editions , one with a wood-like colour and maybe feel , and one with a grey-black colour . The wood-like for the more uh exclusive people . People with more money . uh some uh research uh a about um designing of an

interface . Um the uh last meeting uh we had a about um uh using a f few buttons . that's w what I what I want to uh uh to do in uh our design . just um we have just to focus on the primary um functions . finding an attractive uh way to control uh the remote control . Um the uh I found some uh something about uh speech uh recognition . only uh buttons uh for uh sound , um for uh on-off , um uh shifting u up uh sa uh ca channel or uh down shifting down . we uh need some uh new a attractive functions it's uh like a speak uh speech uh recognition and um a special button for selecting uh subtitles . overall um user-friendly . using uh large large buttons . Um It's uh possible to uh uh to make um quite cheap uh system for uh speech uh recognition . Um you can think about um uh when you lost your um remote control , you can uh call it and um it gives an um sig signal . And and uh for uh shifting up a sen uh c ch channel or uh for um uh putting out uh sound or something , you can uh just give a sign uh say um sound off Television uh put the sound off uh put the sound off uh . Um I was thinking about the special uh button for uh subtitles , um just one button to keep it uh simple . Uh one push on the button uh you get uh uh small uh subtitles . Um double push push um , if double click , um so uh you get uh big uh subtitles , for uh people uh um uh which c f uh who can't uh read small uh subtitles . we've got um the buttons we have to use . The on-off , sound on-off , sound higher or lower , um the numbers , uh zero to uh uh nine . Um the general buttons m more general b one button for shifting up and shifting down uh channel . Um also we want to uh use a little d display uh for um for displaying the uh the functions of the buttons . And um we can uh build in a function f which uh shows the channel or some uh which the t television is on . made a little uh picture of uh it . Just um we can put uh the on-off button uh over in this uh corner , D display uh of it , it's uh just a small display . Uh um you can put it uh on top . and a special uh button for shifting up uh and uh shifting down uh channel , um it's uh on place where um the thumb of of the About the components design . Um for the energy source we can use a basic battery or , a as an optional thing , a kinetic energy , like in a watch , But if we choose for that option , the docking station would c become obsolete . So I don't think it's really an option . Uh for the casing , uh the uh manufacturing department can deliver uh a flat casing , single or double curved casing . It's really up the the design that we're gonna use . Uh as a case supplement , we could um , I thought of that I later , uh a rubber uh belt , like a anti-slip . Uh for the b buttons , we can use plastic or rubber . And the chip-set , um it says simple here , but it should be advanced , because we're using an L\_C\_D\_ uh screen . And as uh the trend-watcher presentation showed , um people like wood , but it raises the price and it doesn't really fit the image , unless we would start two product lines . Um well the kinetic energy source is rather fancy . But depends on what we want . Um for the case , uh the supplement and the buttons , it really depends on the designer . that brings us to the discussion about our concepts . Um first I think we can talk about the energy source , uh f I think first of all we have to see uh it is possible to introduce kinetic energy in our budget , I think . We could use the basic normal battery . Uh a hand dynamo . there there are four options . But I don't think that's really an option . Uh solar cells . But not every room is very light Or the kinetic energy . And how exactly does the kinetic energy work ? y you basically shake your remote , and then it powers up . personally I don't think that older people like to shake their remote control before they use it . And besides that you mentioned it would make the docking station obsolete . And I think our docking station could be one of the marketing issues with which we can um get great popularity for our product . you could um insert the find the lost remote control function in there . Uh it's uh just a small display so I believe uh it will run on one battery for um six months

or f or or more . I think uh elderly people just like to have everything in place . And I don't think they they like uh remotes just laying everywhere in their rooms . So maybe a docking station will help them give the remote a place . And also what you said . Um you can introduce voice recognition by uh finding back your remote . But I think it's um more efficient and cheaper to put it in the docking station . So you have a but button on your docking station which you can push , and then it starts beeping . And then we can we can still use the voice recognition , but maybe then for only the the channels . I'm wondering um what will the voice recognition mean for the production price ? Mm I don't have any information on pricing . Um we also um asked if w they would , if people would pay more for speech recognition in a remote control . you can see here , our target group would not do that . I would greatly advise not to do it . So if that would increase the price for which we're selling our remote control But that would also go for the L\_C\_D\_ screen then I guess . It's a bit higher percentage , here the question was , would you prefer it . And on top of that the L\_C\_D\_ screen would um help in making the remote control easier to use . And I think a voice recognition function would not make the remote control much easier to use . I personally think the L\_C\_D\_ screen we wanna use , with the extra information , I think nobody has anything against it . Because it's just uh some extra information , Maybe we have to uh discard the voice recognition . If we don't have the voice recognition , it will it won't use a lot of energy to use . Um in that case we could use kinetic uh energy , but I think just a simple battery which you can reload on a docking station is just as good . And much cheaper as well . And that's the best choice . let me just choose for the battery . That brings us to the chip . there isn't any choice there because we're using the the the display . So it's gotta be advanced . And then we get to the point of the case . Uh if we wanna choose for wood or the black and grey . Or both ? wood is a lot more expensive to produce . Um but I think it will attract elderly people who wanna have something exclusive , And I think most important factor there is the wooden colour . But with colour was a lot more expensive ? Or ? I'll have to uh research . It's a lot more difficult to to handle and to to get in the right shape . with uh mobile phones uh uh so uh like the Nokia mobile phones , uh when you can change the case of it . Uh is it possible uh to make um changeable uh case . you have just to make one um standard um remote control , I think that's a very good option . You can sell the cases . and then you can make them with colour . Black and grey , other colours as well . We would have to look carefully into the design though . Costs . I think w we should just , we should then just design one um one remote , but it would have to be fancy with either the wood cover or the plastic one . everybody's okay with the changing covers ? I think that's a good uh good option . Um I heard our Industrial Designer talk about uh flat , single and double curved . the the general like most older remotes are flat , just straight . And what would single curved and double curved mean ? Um it would just only affect the form , for as far as I know . It's has to be possible to stand up ? Or just only to lie down ? just to lie down . the interface . What type of interface do we want to use ? Uh we can just use the regular form of it , Um you uh said you wanted to put the um changing channels button on the right side , so you could , so your thumb would be easily Um I thought maybe we could just make one of those buttons on both the left and the right side . For left-handed users also . Is it possible to um program it s so uh you got on the left side uh or on the right side uh buttons for for shifting u up and shifting up ? And on the uh other uh uh o other side uh buttons for uh shifting , uh for for the sound ? but I'm not sure if that would be very good for the easy , ease of use . Can't we make uh Can't we make a remote which you can flip over and use on the same No that's not gonna work . I

guess . But is it a problem that left-handed persons use a different hand ? I think the functions are that basic that nobody should have any problems with uh choosing a channel I think we could just uh leave it a normal shape . Let's look at the flat case . The the single curved so I'm not really sure what they're gonna look like , but I think it's something like this . or better Should prevent repetitive strain injury a bit . this type should be better for you I suggest um the single curved , because maybe the curve is pretty good to put the the screen in . the remote control have to um lay in your hand . Um bit like so uh um in the form of your hand . And to put uh the the buttons for um changing uh the channel uh over here uh But I think it's better to put the screen uh on top . And I'd prefer the corners to be round . But um the on-off button , um still on the top uh Then We've got a general idea of the concepts and the materials we're going to use . for the next meeting uh we'll have to look at the look-and-feel design . It's important that the corporate design image uh is going to be in the remote . So check out the corporate website maybe . The user interface design , it's the same story . And product evaluation . So the Industrial Designer and User Interface Designer are going to work together on this one . But you're going to get your instructions I think send by the coach . just um I will put these um minutes on the in the folder . I'm not sure if you're going to start right away to work together I think you're going to fill in the questionnaires first . And then you'll get a message . Then we can save this one in the folders group . if you wanna have a look at it , it's over there in the projects folder .

## Complete Meeting Transcript

Okay. Uh good afternoon. This is our third meeting already. I hope you enjoyed your lunch. I did anyway. Um let's see. Presentation three. Okay this is um the second phase uh we're going to discuss today. It's the conceptual design meeting. And a few points of interest in this meeting um are the conceptual specification of components. Uh conceptual specification of design. And also trend-watching. Um these are hopefully the points you addressed in uh your pre uh presentations you're going to show me in a few minutes. Um but first I'll show you the agenda. Uh first the opening. Then we have three presentations. Uh after that we have to come to a decision on remote control concepts. How we're going to make it. And then we're closing. We have about forty minutes. Uh so I suggest let's get started. Uh did someone encounter any problems during the preparation? No? Everything fine? That's nice. Then a little uh thing about the last meeting. Uh these are the points um we agreed on. The requirements and the target market. Uh requirements are uh teletext, docking station, audio signal, small screen, with some extras that uh button information. And we are going to use default materials. Um does somebody have any comments on these requirements? Maybe? No? These are just the the things we thought of, so maybe if you figured something else or thought of something else, just let me know. And maybe we can uh work it out. And we're going to target uh sixty to to eighty year old customers. So now everybody knows what we're do we're doing, um I suggest let's get started with the presentations. So shall we keep the same uh line-up as uh last time? Okay. Good luck. Okay. Thank you. Any questions about the the trends? Mayb No? Okay, we go on to the next one. Okay. Uh thank you. Okay. Thank you. So that brings us to the discussion about our concepts. Mm. 'Kay. So these are the points we have to discuss. Um first I think we can talk about the energy source,

since that's um has a pretty big influence on production price, uh and image. Uh so uh f I think first of all we have to see uh it is possible to introduce kinetic energy in our budget, I think. Yeah. Okay. Yeah. No. Yeah. Okay. Yeah. Yeah. Uh Uh well I think uh elderly people just like to have everything in place. And I don't think they they like uh remotes just laying everywhere in their rooms. So maybe a docking station will help them give the remote a place. And also what you said. Um you can introduce voice recognition by uh finding back your remote. But I think it's um more efficient and cheaper to put it in the docking station. So you have a but button on your docking station which you can push, and then it starts beeping. And then we can we can still use the voice recognition, but maybe then for only the the channels. That's safe. Yeah. That's a good point. Yeah, sure. Go ahead. No. Yeah. Yeah. Yeah. Easier to use? No, I think that's a good point. Yeah. I personally think the L\_C\_D\_ screen we wanna use, with the extra information, I think nobody has anything against it. Because it's just uh some extra information, and it's easy to ignore as well. So if you don't wanna use it you just don't use it. And um yeah I think the um Maybe we have to uh discard the voice recognition. Because it will increase cost uh signifi uh significantly. And I don't think the I don't think it will be a lot easier to use, as well. So that brings us back to the energy. If we don't have the voice recognition, it will it won't use a lot of energy to use. Um So in that case we could use kinetic uh energy, but I think just a simple battery which you can reload on a docking station is just as good. And much cheaper as well. So Okay let me just choose for the battery. That brings us to the chip. Just the advanced. Okay, advanced chip. And then we get to the point of the case. Um which brings us a little bit back to marketing as well. Uh if we wanna choose for wood or the black and grey. Or both? Um as we saw there is n

ot Yeah wood is a lot more expensive to produce. Um but I think it will attract elderly people who wanna have something exclusive, which they can show off to their grandkids. Look I've got a new remote control, and uh Yeah. That's right. But with colour was a lot more expensive? Or? You don't know? I think so because Yeah. It's a lot more difficult to to handle and to to get in the right shape. Yeah. Change the cases. Yeah. You can sell the cases. Yeah. I think that's a very good option. Because um then you can advertise as well with the Give your grandfather a new case for his remote control, or whatever. Because that's a it's something extra, it's something other remotes don't have, which we can get a great advantage point. So and then you can make them with colour. Black and grey, other colours as well. Costs. Yeah. Yeah. So you suggest we should design two different telephones on which you can apply, yeah remote controls, on which you can apply different case covers, for example. Remote. Yeah. Okay. So everybody's okay with the changing covers? I think that's a good uh good option. Changing case covers. Yeah. Mm. Okay. Uh but the form has to be um It has to It's has to be possible to stand up? Or just only to lie down? And the the cover of the the docking station is also on top of the television then? Or not? And you can just yeah then click it in. That's okay. Um so the interface. What type of interface do we want to use? Um maybe you can make a little drawing of it on the on the the board. Does somebody have ideas for a form or Yep. Mm. Usabili Yeah ease of use will be a lot more difficult, and then it's But you have extra buttons. So people can get confused. Especially if they have the same writings on it. Can't we make uh Can't we make a remote which you can flip over and use on the same functions as the normal one? Then you have to Let's see if I ca A blank one. And then you get Here's a little L\_C\_D\_ screen. Uh now I have to think. It's a plus and a min. No it's not very handy I think. Because the plus and the min will be opposite and all kinds of No that's not gonna work. I guess. Maybe we should Yeah. But is it a problem that left-handed persons use a different hand? I think the functions are that basic that nobody should have any problems with uh choosing a channel or Y yeah. Yeah. I think we could just uh leave it a normal shape. Uh but maybe we have to make it a l a bit more

fancy. In one or another way. Yeah. Um yeah just Yeah. Easier? 'Kay. I suggest um the single curved, because maybe the curve is pretty good to put the the screen in. Uh so that elderly people can uh use the remote control and at the same time look easily at the screen, because it's a bit, it has a bit of an angle. Yeah. I think so. Yeah. But now it's Do you have it upside down or Do you have it this that's top? Okay. Yeah. So get your mouse. Yeah. Yeah. That's a good one. But I think it's better to put the screen uh on top. So just flip it a hundred and eighty degrees around then you get here. If you can have this one, you turn it like this. And then flip it upside down. Because uh maybe your hand is in the way, if you have the display here. I think i On top. Yeah.. So then we get Here's That's the curve. Here the display, and then buttons. Yeah and then we can have a little bit off here and here maybe. Just that's for left hand and right hand users. And then h the rest of the buttons over here. Yeah still here jus That's Yeah. Should be more bit more friendly, yeah. 'Kay. Supplements. That's okay. Where's my mouse? Then We've got a general idea of the concepts and the materials we're going to use. So now for the next meeting uh we'll have to look at the look-and-feel design. It's important that the corporate design image uh is going to be in the remote. So check out the corporate website maybe. The user interface design, it's the same story. And product evaluation. So the Industrial Designer and User Interface Designer are going to work

together on this one. But you're going to get your instructions I think sended by the coach. So just um I will put these um minutes on the in the folder. And then we're going to uh try to finish our project, and uh make a good design for all the grandfathers and grandmothers, I think. Which are Uh let's see. I'm not sure if you're going to start right away to work together or I think you're going to fill in the questionnaires first. And then you'll get a message. So that's uh basically it. Maybe this one? Then we can save this one in the folders group. Uh yes, it's here. SMARTboard, there it is. So if you wanna have a look at it, it's over there in the projects folder. And then I guess we'll start in thirty minutes again. Thank you. Good afternoon. Sure. I'll start off then. Doh. 'Kay I'm uh gonna inform you about the trend-watching I've done over the past few days. Um we've done some market research. We distributed some more enquetes, questionnaires. And um besides that um I deployed some trend-watchers to Milan and Paris to well get all of the newest trends. And I've consulted some additional trend-watch trend-watchers, after the original trend-watchers return, about what the the best design would be. Um okay these are some overall findings. Um most important thing is the fancy design. Um the research indicated that that was by far the most important factor. Um innovativeness was about half as important as the fancy design. By innovativeness this means um functions which are not featured in other remote controls. Um about half of, half as important as the innovativeness was the was easy to use. Um for our um group, we're focusing on the people of sixty to eighty y years old, this is um, these factors are slightly more equal. 'Kay these are some more group specific findings. Uh the older people prefer dark colours. Uh they like recognisable shapes, and familiar material. And our surveys have indicated that especially wood is pretty much the material for older people. Um this is, this image will give you a little bit of an impression about um the look-and-feel that um the remote should have. Um this leads us to some personal preferences. Uh the remote control and the docking station should uh blend in in the in the room. Um so this would mean no uh eye-catching designs. Just keep it simple and Well the docking station and small screen would be our main points of interest, because this would be the These would uh be the innovativeness in the remote control. So this would be very important that we at least include these features. Um well the trend-watchers I consulted advised that it b should be, the remote control and the docking station should be telephone-shaped. So you could imagine that uh the remote control will be standing up straight in the docking station. This is not really This is pretty much a new shape to

uh older people. So they would prefer uh a design where the remote control just lies flat in the docking station. So it would be kinda more telephone-shaped. Um besides that we would advise um to bring two editions, one with a wood-like colour and maybe feel, and one with a grey-black colour. The wood-like for the more uh exclusive people. People with more money. Uh the grey-black colour for well people with less means. That would be all. Any questions? And how exactly does the kinetic energy work? You just You use it and it works. Okay. Well personally I don't think that older people like to shake their remote control before they use it. And besides that you mentioned it would make the docking station obsolete. And I think our docking station could be one of the marketing issues with which we can um get great popularity for our product. Um wel Yeah you could load up the batteries, you could um insert the find the lost remote control function in there. That's true. I'm wondering um what will the voice recognition mean for the production price? 'Cause in our earlier um market research, if you'd allow me to go to the

flat board, SMARTboard. Um so it was open here. Um we also um asked if w they would, if people would pay more for speech recognition in a remote control. Well you can see here, our target group would not do that. So if that would increase the price for which we're selling our remote control I would greatly advise not to do it. I think that would be better to uh insert in our other product, that is meant for the younger people. Um well this is Yeah but this is here the question was, would you prefer it. So that doesn't really mean they wouldn't pay extra for it. And on top of that the L\_C\_D\_ screen would um help in making the remote control easier to use. And I think a voice recognition function would not make the remote control much easier to use. Um well this was for like an L\_C\_D\_ screen like you would have on a on the the most advanced mobile phones. So pretty large. 'Kay. Mm-hmm. Mm-hmm. Well And I think most important factor there is the wooden colour. So it wouldn't actually have to be wood, if it's just wood-coloured. Probably. Yeah that is true. Yeah. We would have to look carefully into the design though. 'Cause we would have to make one w uh control which would fit in with a wooden cover and a plastic cover. The more original one, or the more standard one. So that would Well I wouldn't design a telephone but Well no I think w we should just, we should then just design one um one remote, but it would have to be fancy with either the wood cover or the plastic one. So, but that shouldn't be too much of a problem. Um I heard our Industrial Designer talk about uh flat, single and double curved. Could you explain that a little more? Mm-hmm. And what would single curved and double curved mean? Okay. So we can pretty much just do whatever we want. 'Kay. That's good. No just to lie down. We'll go for that. Well or besides it. Mm-hmm. Um you uh said you wanted to put the um changing channels button on the right side, so you could, so your thumb would be easily Well uh I think that was a very good point 'cause I pointed out earlier that a lot of remotes cause R\_S\_I\_. So that would be great for that. Um I thought maybe we could just make one of those buttons on both the left and the right side. For left-handed users also. For the volume. Um well that could Yeah we could do that but I'm not sure if that would be very good for the easy, ease of use. But if we would make um a changing channels and changing volume button on both sides, that would certainly yield great options for the design of the remote. 'Cause it could be made all symmetrical and stuff. That is true. Yeah. Yeah. That is true. Yeah. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Yeah. Yeah. Mm-hmm. And I'd prefer the corners to be round. Think that would be better. Friendly on the eye. Yeah. Yeah. Very good. No. Mm no. Um 'kay um yeah. uh some uh research uh a about um designing of an interface. Um the uh last meeting uh we had a about um uh using a f few buttons. So uh um uh that's w what I what I want to uh uh to do in uh our design. So um finding an attractive uh way to control uh the remote control. Um the uh I found some uh something about uh speech uh recognition. So maybe uh we can uh use uh that. Um Uh and uh using a

little uh display. So um findings. Um yeah just um we have just to focus on the primary um functions. So uh only uh buttons uh for uh sound, um for uh on-off, um uh shifting u up uh sa uh ca channel or uh down shifting down. Um uh let's see. Um yeah and Uh we uh need some uh new a attractive functions uh uh which attract uh uh people for using it. So uh it's uh like a speak uh speech uh recognition and um a special button for selecting uh subtitles. Just uh what we uh mentioned uh last uh meeting. Um and yeah overall um user-friendly. So uh using uh large large buttons. Um It's uh possible to uh uh to make um quite cheap uh system for uh speech uh recognition. Um you can think about um uh when you lost your um remote control, you can uh call it and um it gives a

n um sig signal. So uh uh yeah. And and uh for uh shifting up a sen uh c ch channel or uh for um uh putting out uh sound or something, you can uh just give a sign uh say um sound off or A and uh yeah. Television uh put the sound off uh put the sound off uh. Um Let's see. Uh yeah. I was thinking about the special uh button for uh subtitles, um just one button to keep it uh simple. Uh one push on the button uh you get uh uh small uh subtitles. Um double push push um, if double click, um so uh you get uh big uh subtitles, for uh people uh um uh which c f uh who can't uh read small uh subtitles. So uh Um Yeah and w we have to keep uh in general buttons uh so um we've got um the buttons we have to use. The on-off, sound on-off, sound higher or lower, um the numbers, uh zero to uh uh nine. Um the general buttons m more general b one button for shifting up and shifting down uh channel. Um also we want to uh use a little d display uh for um for displaying the uh the functions of the buttons. And um we can uh build in a function f which uh shows the channel or some uh which the t television is on. So um made a little uh picture of uh it. Um See. Um yeah. Just um we can put uh the on-off button uh over in this uh corner, um almost uh e all uh remote controls uh are using a on-off button on that place. Um so uh people uh will uh recognise uh um the button. So um D display uh of it, it's uh just a small display. Uh um you can put it uh on top. Um it's uh most uh uh place where people uh, most of looks at. So uh um and a special uh button for shifting up uh and uh shifting down uh channel, um it's uh on place where um the thumb of of the So you you can uh easily uh shift up or shift down. Um it's uh quite uh handy place. So um and uh all the f functions for subtitle uh one button, uh for sound uh Uh and uh for our design, um uh we have to discuss about it uh I think uh so uh the form of it so And that's it. Mm. Nah. But what's the function? Yeah f for loading up uh the batteries. B b Okay but uh it won't use uh much e energy uh I I believe. Uh it's uh just a small display so I believe uh it will run on one battery for um six months or f or or more. So I believe one battery uh is just enough. Uh so Okay. Yeah. That's true. Yeah. Mm-hmm. Yeah. Okay. Yeah. Uh. Mm. Mm. 'Kay. Yeah. But uh is uh our uh research um about um bi large uh L\_C\_D\_ sh uh display, or uh just a small one uh we want to uh use? Okay. Yeah. No. Yeah. Yeah. Mm-hmm. Yeah. Uh I dunno. Mm. Mm. Uh is it possible uh to make um changeable uh case. So um uh you 'cause uh Yeah with uh mobile phones uh uh so uh like the Nokia mobile phones, uh when you can change the case of it. So maybe it's possible uh possibility. So um um you have just to make one um standard um remote control, and um yeah you can sell uh few uh Yeah. Yeah. Yeah. Yeah. Yeah. okay. Mm. Uh we can just use the regular form of it, but it's um not quite uh fancy. So um Yeah. Yeah. Yeah. For uh Uh for Yeah yeah. Mm. Yeah we um Is it possible to um program it s so uh you got on the left side uh or on the right side uh buttons for for shifting u up and shifting up? And on the uh other uh uh o other side uh buttons for uh shifting, uh for for the sound? Or Or isn't it? Yeah okay. Uh. Mm. Yeah but Yeah. Yeah. Yeah. See um yeah. Or we have to make a left uh For lefties and Um You mean um Yeah if Mm no. Yeah. Um Yeah. It's just uh u using uh your thumb. So um it's Yeah. Yeah. Um Yeah yeah. Mm-hmm. Mm. So um Do you say this um S uh Uh you got like uh sort of a I believe There? So um you want to put a display over here? Or not? Yeah. Um Yeah. Uh we can make it um

Mm? That's the top. So uh this top. This down. Um maybe it's possible to uh make this side like um Let's see. Um Colour uh okay. Uh to make this side um like mm the right colour. Um bit like so uh um in the form of your hand. So um Uh it's an So so the remote control have to um lay in your hand. So uh it's possib um yeah for s so and And to put uh the the buttons for

um changing uh the channel uh over here uh Yeah. Uh rem Yeah but this place um Uh it's Yeah I dunno um Yeah. Yeah so So Five minutes. Yeah. Yeah. But um the on-off button, um still on the top uh Yeah. Yeah. Yeah. 'Kay. Yeah. Yeah. Yeah. Okay. Okay. About the components design. Um for the energy source we can use a basic battery or, a as an optional thing, a kinetic energy, like in a watch, which you just shake and it produces energy. But if we choose for that option, the docking station would c become obsolete. So I don't think it's really an option. Uh for the casing, uh the uh manufacturing department can deliver uh a flat casing, single or double curved casing. It's really up the the design that we're gonna use. It's uh doesn't uh imply any technical restrictions. Uh as a case supplement, we could um, I thought of that I later, uh a rubber uh belt, like a anti-slip. Uh for the b buttons, we can use plastic or rubber. And the chip-set, um it says simple here, but it should be advanced, because we're using an L\_C\_D\_ uh screen. And as uh the trend-watcher presentation showed, um people like wood, but it raises the price and it doesn't really fit the image, unless we would start two product lines. Form should follow function overall. Um well the kinetic energy source is rather fancy. But depends on what we want. I think we should disc discuss that. Um for the case, uh the supplement and the buttons, it really depends on the designer. And the chip-set uh really should be advanced because otherwise uh it would really be a simple uh remote control. And that's it. Yes w there there are four options. We could use the basic normal battery. Uh a hand dynamo. But I don't think that's really an option. You don't wanna swing before you can watch television. Uh solar cells. But not every room is very light so it's not a very good option. Or the kinetic energy. Well y you basically shake your remote, and then it powers up. Yeah. Yeah. That's true. Oh. Mm I don't have any information on pricing. So I'll have to ask the manufacturing department. But that would also go for the L\_C\_D\_ screen then I guess. It's a bit higher percentage, but Okay. And that's the best choice. Well there isn't any choice there because we're using the the the the display. So it's gotta be advanced. Mm I dunno. I'll have to uh research. Yes. Yes. Well the the general like most older remotes are flat, just straight. And uh our d manufacturing department can also deliver single curved or double curved ca curved cases. Um it would just only affect the form, for as far as I know. So it's j really just up to the design department what we're gonna use. It doesn't really matter for the price or the functionality. Pick one you like, yes. Yeah. I think we should start by by choosing a case. Because that's the basis you're building on. So I could draw them out. Let's look at the flat case. Oh. It's from the side so it's rather normal. The the single curved so I'm not really sure what they're gonna look like, but I think it's something like this. So this type should be better for you or better Should prevent repetitive strain injury a bit. And the double curved s looks something like this I guess. So th those are the three options we have. Yeah. It's more logical to have it on top as well because, like on your mobile phone, it's always above. Oh maybe you should just s start on a blank page. Okay. Okay.

---

# Meeting ID: 67

Data Source: Train

## Executive Summary

The Project Manager introduced himself and the project to the group. He presented an agenda for the rest of the project. The group acquainted themselves with the meeting-room materials by drawing on the board. The Project Manager discussed the projected price point, profit aim, and production cost for the project. The group discussed their initial ideas about the product design. They decided to make the remote a universal remote. They discussed the form of the device; it was suggested that the device could have a folding-open design or a touch-screen interface. They discussed energy source options and could not decide between using standard batteries or a recharging stand. They also discussed how to make the remote look more unique; it was suggested that the remote could feature the folding-open design to hide complicated functions on the inside of the device. The Project Manager instructed the Marketing Expert to prepare the user requirement specification and to research which devices the remote will control.

## Complete Meeting Transcript

Hello. Hello. You have to put it exactly on the on the yeah. I took your mouse. Yeah just yeah, no, that's for me, I just have to make some notes. I got my uh mouse. yeah. Uh actually my laptop doesn't work, switch it on again. Oh no. So you all read what we are going to do or not? Okay. Yeah, that's right. I just made a a simple uh presentation. So you put some things in it. Okay. How does this work? I dunno. This one? Ah cool. Okay. So that's my name,. Uh we're going to make uh a remote control, you already know that. Just have a look, are we going to uh this agenda of our meeting. You know, this is about twenty five minutes, this meeting. So um the thing we have to know is you already know what we're going to do, you also read what this the things or, not yet, okay. So um, yeah, it has to be original, trendy, user-friendly that's what we're going to design. Uh first we have uh uh three steps of uh making the the remote control. Fir the first thing is th the functional design, that's very important. We have to look what the needs are, the effects of the functional design, and and how the mm the the remote control works, so that's where we're going to look in the functional design, it's for the f next meeting. The the second thing is the conceptual design, that's what it that's uh the spe the specifications of the

components and the properties and the specifications of the user interface. And we have to look what uh the market is doing for what kind of uh remote controls are in the market. And the third thing is uh the detailed design um and that's exa yeah, you know what it is, it's exactly how it looks and whatever. Okay so uh no, this is a these are two smartboards, with the uh f uh s an introduction of that one. And you already saw you know all that that you here can put uh things in the the red project uh map. Folder, okay. So no okay have a look at that one. Okay. So uh what we're going to do first is um so you can read. You have to uh draw uh a favourite animal on the whiteboard and um and say why it's your favourite animal. So and you have this is just to try it out and we have to uh use a different pen colours and different thickness of the pen. So okay, so first have to show you, maybe you can come here to have a look how it works. Yes? Okay. This a new page, it's okay. Use pen format. and a different colour can use here no I just take the pink. You take oh there's no pink, okay, oh just purple, okay. No blue. And uh line width ten. Okay uh just take what I'm going to draw is an elephant. Just draw slowly, because otherwise it won't work. It's a very nice elephant, you can see. I dunno what it looks but it doesn't matter. I just h Something like this? Oh no Yeah, okay. Because I like uh okay. Just takes so long, okay. Whatever, just. You erased this one. It's a bit slow you can see, this is a bit annoying. Okay, so just for you guys just one of you can draw a painting if you want. Just don't um yeah, just u use it like that, yeah. That's okay. It's in format. Yeah. Just No it has to be an animal, so if that's it's it should be a shna snake or something. Okay. Okay okay. Okay. Okay, cool. Hmm yeah, that's nice. Uh do you have to write down why uh that doesn't matter, just it's to get used to the whiteboard, but it's okay. Just make a new blank new blank page. Yeah, not too far to the to the t pen top. Maybe you should hold your pen a bit more to the back, so that no, to the yeah. No, it's a dog. Uh we d only have twenty five minutes, so. Use your fantasy. Just hold it more more to the back then you don't have okay. No, that's okay, thank you. I thought these pens would be just um uh you write it down and you download it to Word, you already did it or no? No, not yet, okay. But it's just Sorry? Yeah, I know, but I d I I thought it would be just in in in uh typed words in Word, so that's not just it's just a picture. So it's not that cool as I th thought it would be. No. I don't know, what time did we start this meetin

g, I'm not sure. Half past. Okay. Okay, perfect. Yeah, thank you. Now we just have to save everything, so. Oh this is definitely the best one. Okay, so uh what we know is that we have to sell this uh remote control for about twenty five Euros. Okay, that's. And uh we have to make a profit of fifty million Euros, so we have to uh use a big market in Europe. The production cost are about half the price of selling price, sorry. So can someone make a a calculation about how many we have to sell of these to make fifty million, I dunno. Uh so we're gonna have a little discussion about um what experience are with a remote control the and everything, so just have a look how it we think about remote controls. Oh yeah, that's a good question. I think it's I'm not I'm not sure, it's not mm I think I don't think you can buy a a universal uh remote control for twenty five Euros, so not sure, but Okay, so we we just say we just say that's universal remote control. Okay, perfect. Yeah, everything just so a lot of buttons on the remote control. No, just everything.. so yeah, what what what's a remote control, it's just a black thing with some buttons on it, it's not nothing very special, but um yeah, that's right. So do you have any ideas how it has to look for for usability or user Hmm yeah. That's right. Should be a good point. Just big enough for the buttons we have, that's that's it. But you you you you think about uh uh one you can fold open. Okay, yeah, that's cool. Maybe for the D\_V\_D\_ pla player or something, if you just okay. Yeah. Why should you use a touchscreen on a remote control? There are buttons on it. Okay. But it's not t t t too expensive to put a touchscreen on it. Yeah. Yeah. So. And if you have a touch screen in it, it's definitely too too fragile uh fragile. No. You can put games on your remote control. Whatever. Oh

maybe that's a good idea, just to put it on your television and just s recharge, you never have to use any batteries. Yeah, how m how mu how how expensive uh is a normal recharger? I dunno. Uh if you th look at the market, it's probably it's still the best way just to put batteries in it, because maybe it's too expensive. Yeah, that's right, yeah. The option, just the option, that's cool. Yeah. Has it be has does it has to b have to be um uh like a different form than a normal remote control or Yeah Yeah. Yeah, just for the T\_V\_ and just the normal function, that's fine. But maybe it's maybe it's very hard to to make it fold open and to I look like it's very uh uh what's it's called? Maybe it's hard t No, that's right. So maybe we have to to uh keep it like mm a square, just normal remote control. Just think about it. We have to close this uh to finish this uh meeting, so. There's some more things. We have uh another thirty minutes, so then we're going to meet again. So you know what you have to what you have to do? Yeah. Yeah, I think this if you you have to n know if it's for s a T\_V\_, a D\_V\_D\_ player, all that things. Also from a user, but all these things together. Yeah, everything. Yeah, no maybe not not uh, that's not a f that's something for for for yeah. That's not for you. Just if what's in the market, what's normal, uh what kind of uh buttons do you have. Yeah, it's alright. Yeah, just is that okay? Okay. So see you in thirty minutes. For the next time you have to uh put it exactly on the square, so your laptop. No, sorry. Good morning. Okay. Good morning. Should I bring my uh pen too? Or Okay. I do. My laptop is crashing. Cr Help help help. Test test. Yes, it's working. I think my laptop is a bit etchy. Uh p Okay. Wow. Wow. Take it easy. I I was gonna make a cat too. Okay. Nice, eh? Uh. Excuse me. Yeah, it probably would be universal. Hmm, maybe, I don't know. And uh also for the V\_C\_R\_ and uh D\_V\_D\_ player and okay. Yeah, probably. Okay. And how big should it be? Yeah. Yeah. Yeah. Yeah n Yeah, or you c O or you could th think of an uh uh a small touch screen on the remote control. Uh maybe be uh

it's it's Yeah, or um maybe to keep it uh easy and uh small. Uh like a a to have Yeah, maybe it would. Kid-proof. And uh how about the batteries? Uh should you put it in a recharger or a just Mm yeah. Yeah, I dunno. Yeah, if you buy it uh separately from your phone it's probably expensive, but I don't know what the project uh projection costs are for such a thing. Yeah. Yeah. Yeah, but I have a mouse that's uh uh also uh Yeah, and and you just have normal batteries that you can recharge and just put it in the station, or you can change your batteries, so. Yeah. N uh if if we want to make it special, we probably have to do a lot of testing, if it really works. Yeah. Yeah. And what we have to think about too is uh uh buttons that you use often are um maybe uh like when you fold it open, when you have it closed, you can still uh do the th the functions. Yeah. But n yeah, but uh i basically when I'm watching T\_V\_ I'm just using like five buttons or so, so. Yeah. Okay. Okay. Okay. Two. Good morning. Mouse. Come on. There we are. Let's just check one more time. Mm. Yeah. One uh most to the right. Yes that one. Yes. Yes. Yeah. Purple. Looks very nice. A pink elephant. The water is important. Yeah. Yeah. Like this? Okay. Um let's make it um a dog. Ooh. Ah okay. A pig? I can make a dog. Um 'Kay, I make a cat of it. Oh, not too quick. No I have it. I just draw too quick I think. Okay, that's it. More. It's just to get used to it. Yeah, that's right, it but you actually got to write on the paper. You really got to write on that paper. Yeah, but it's just a picture. You really No. It's a donkey. Uh I think it was uh Yeah. Piece of cake. Uh easy. Universal. And only television? Or more devices? Ah okay. Not just a T\_V\_. Okay. Well we can try to make it special. Well Yeah. Nothing N It shouldn't be too big, but I don't think we can make it too small, 'cause it has to have a lot of functions, so. We can't make it smaller than the things we see now I think. Yeah. Or we have to make something uh like uh mobile phones that you can uh fold it opem. Maybe then you can make it s smaller and uniquer, maybe more trendy. Fold open, where you can see uh more options. I think Yeah, something uh on top, just dren general things like volume and T\_V\_ channels and inside things you don't use that often. Yeah b I wanted No you can make an uh

manual in it. But that's Yeah, I think it's much uh too expensive. Yeah, too fragile. Yeah. Yeah. Maybe that's a good idea, but yeah, we have to look at the price now I think. Well uh how much is your uh standards uh mobile phone recharger? Maybe have uh Yeah, 'cause well Yeah. Maybe uh use it as a separate option. Sell it uh separately. Rechargeable. Yeah. Yeah. Well I think we have to look at that, 'cause well you can do the standard way, but then you won't Well you can um have uh the basic things on the same place, like on off button on top and the T\_V\_ channels one two three four as a block, and then the volume uh obviously on t on top, so you can see. But the rest is uh you don't use that often, so if you have a clear button with an good icon on it, it should be clear as well. So it doesn't matter what place it is on the remote control I think, so you can do something unique with that. Yeah, yeah. Yeah. That's what I meant. Uh Okay, but yeah. No, what you want to do with it. Yeah, I also wrote down some stuff that you want on a Technical fun fu What do you want to do with your remote control, what do you need on your remote control. I already wrote some down, some ideas. Yep. There's already a document in the folder about it. Okay. I will. It didn't say that. Your fault. Bye bye. Hello. Ah. Plate? Uh I also forgot my mouse, but I don't need my mouse, I think. Damn computers. Can you hear me? Hello? Test. I dunno. Check. Okay. I think it works. Mm-hmm. We're gonna make a remote control. Press F\_ eleven. Folder, yes. Ah I can see it now. It look like a dinosaurs. Okay. Let me try one. Okay. Mm. Okay and then uh what

's the colour? How do I do Ah. I'll take this one. Uh there has to be water, but Yeah yeah, but it's an animal it's an animal that lives in the water. So I first uh draw the water. Uh. Okay, and now I make the animal. It's a fish. Mm-hmm. So. Um This is a worm. Okay, who next? Uh Okay. Well Paul? I think it's a pig. Or a dog. A sheep? No. Yeah yeah, it's a real pen. Oh. Y you can you can't edit in the edit it in Word. Oh, okay. Half past ten. Brilliant. Yep. Yeah, my first question was does it have to be a universal remote control? Because we sell it uh uh uh lonely from the t and not with the television, we sell it uh apart. So I Because Yeah, I know uh you can buy a re a universal uh control for uh only twenty uh Euros Yeah, I think. Okay. Well I th I thought about um making it the same uh style as the television, we don't have uh the same television uh all the time, so uh that's no matter. Um if we uh control the V\_C\_R\_ and the D\_V\_D\_ player player with it uh it has to be clear, because uh kids and uh elderly are gonna use it, so uh it's not only for the uh technical persons. Um I think it must be a very good control, so you can uh uh uh act uh use it from uh everywhere in your room, the the infrared uh thing must be from very good quality. No. Yeah. I dunno um Yes Ah that's that's Ah right right. Oh that's good, yeah. Yeah. Yeah, but Yeah but it's not reachable I think, touch screen. And we have to care for uh the strength of the remote control, because uh uh remote controls are most uh things in the house that falls down on the ground and it get often uh broken. Yeah and a lots uh uh lots of kids use it and touchscreen is not uh kids uh Um Ma maybe a home station. Yeah. Ah yeah. Yeah, but a home station is uh a really good idea, because uh lots of people are uh lose their remote control and don't know where it is, and now you can put it always at the same place. Maybe it's Therefore it's a good idea, but maybe it's expensive. Yeah. You can yeah, you can buy it with it. Oh yeah. Uh I I set something on paper already, size, looks, uh usable, uh the buttons on usable places, uh the the on off button must be on top, uh it has to lay good in the hand, you you have to uh Yeah, I don't I don't know I don't know if we You can make it very special, to create our own um looks, but it's very hard to Nah. Yeah yeah, what Paul already said. Uh on on top are the the basic options on top, and if you fold it open Mm. If you if if you make to fold open it's or also an uh the strength uh is not s as good as a normal uh remote control. Okay. Um for m for me uh the Marketing Expert, the user requirements uh specification, do I need to think as a user, a as a a a only the looks and the Okay. Yeah, it's also about strength and uh for

everything uh. Okay. Yep. Okay. Yeah, me too. Okay, well done. Oh Paul. Ciao. Bye bye.

## Executive Summary

The project manager introduced himself to the team and then acquainted the team with the audio and video equipment in the meeting room. The project manager briefly described the company the team works for and discussed the corporate website. The project manager then described the upcoming project and the roles of each team member. The project manager introduced the smart boards to the team and led the team members in an exercise in which they each drew their favorite animal and described why they liked the animal. The project manager briefed the team on the project budget and selling prices for the remote they are to create and led them in a discussion on their experiences with remote controls and what features they would like to include in their product.

## Complete Meeting Transcript

Morning. I'm. Yep. Hmm? Okay. Yeah. Yep. Hmm. Okay. Yeah. Okay. Sure. Yeah. Yeah. Okay. Hmm. A sheep. Okay. Um I'm just gonna draw its uh head, but mm Let's see. Mm. Uh. Okay. Yeah. You know what that is? Or who? Ah okay, yeah. Just a Mm. Guess. So uh Yeah. That's enough. Um, you say a blank, or Okay. Five minutes, okay. Mm? Mm. Oh really? Huh. It's a Sure. Yeah. Okay, yeah. Yeah. Okay, yeah. Hmm. Oh. Mm-hmm. Oh. Mm. Mm-hmm. Sure, yeah. Waterproof, or uh Uh, you never no know uh, I w I mean uh 'Kay. Okay, yeah. Mm. Mm. Yeah. Okay. Yep. Morning. Mm-hmm. Garfield. Well I was gonna draw a cat too, so. I'll just try something else. Something different than Garfield. Mine is a bit more skinny. But uh Well, it's supposed to be a cat. I like cats because uh they are uh independent. The pen. So. The pen. No, me neither. Nope. They were all mentioned, so Okay. So uh good morning. I see you all find your places. Is everybody sitting on the right place? Yeah? I guess so. So Let's see. First I will introduce myself. I don't know if uh if everybody knows me, so I'm Bart, hello. Hello. Bart. Hello. Hello. Bart. Welcome. Uh let's see. Uh let's start off um with a little presentation. Uh Now first I'll tell you a little bit about the setting. You can see there are a few cameras here. They'll record uh our actions and you'll have wires and microphones that will record your voice. Uh there are also some microphones there but th um you don't have to pay a lot of attention on those, because it will uh disappear when you don't attend to it. So is there a project documents folder? There are some notes

in it already I see, some documents. Uh I'll start with the presentation kick off. Is being modified by the administrator. Uh okay. Let's do it read only. Well I don't know if you've noticed, but uh we're working for Real Reaction. Uh it's a company in uh electronics. We put fashion in electronics, uh we make it work, uh we put a lot of effort in design and in the product itself. I'm Bart the project manager so I'll direct you through the project. This is our agenda. Uh we have our opening acquaintance, tool training, project plan description closing. Uh maybe I can sit down, then I can take some notes or Let's see. Maybe you can take the minutes once in a while. I dunno it's not a lot of work, but just uh if you hear something uh you can write down, just write it down. Uh as you can see uh it's the opening, acquaintance tool training. Acquaintance is a point we've done a bit. Um have you all seen the corporate website already? Yeah. Have you seen any flaws in it? I think I found one. No? I can see if it works this way. No, it doesn't work here. Okay no problem. But um on the corporate information side there's a th uh there was Real Remote instead of Real Reaction. Real Remote is not really the company we're we are, but it's just a little fault. Um okay, what are we going to do? Uh our project aim is as you can see a new remote control. It has to be original, trendy, and user friendly. So these are uh the points why uh we also hired you. We've got the Marketing Expert for uh the trendy and user friendly look. And Industrial Designer uh there's also user friendly and a bit original. And we've got our User Interface Designer. He's also uh That's about the new remote control. Uh project method um is uh there are three phases we are going through. First is functional des uh design, individual work, meetings. After the functional design, then the conceptual design and the detailed design. I had some role indications on here. But I think you know it already by yourself. The Industrial Designer is going to work on the working design, uh components design and a bit of the look and feel design. Uh the User Interface Designer is going to do the technical function design, user interface concept and user interface design. And the marketing expert is doing a little bit of user requirement specification, trend watching and project uh product ev evaluation. So that's

a bit what you're going to do. But that will be all worked out in uh other meetings. Then we've got our first tool training. We are going to work with a lot of high-tech tools here, so it's ab it's handy if we have a little bit of training first. As you can see we've got the smart boards here and here in the white board. Um in the white board here there's a little tool bar on this side. Here are some functions. You can save. N uh these functions we don't have anything to do with, only undo, you can undo a little uh piece of drawing. A blank new document for each person. Uh select a pen, eraser. Capture we don't have to do anything with. Uh then we've got our pen. This pen. It's really funny because you can draw with it on this page um in the think it is form of. You can also select the current colour and the line width. But then first you have to select the pen function. But we're going to work with it in a minute. So okay. Uh that's very simple and it's easy to uh draw your findings and drawings on there. Uh then a short thing about documents. We've got our shared folder, uh project project what was it? Project documents I think. But all you will found that already because there are a lot of documents in it already, so it will be okay. And these are available on the smart boards as well, so if you have a document you wanna show, just open it from the folder. Here is a simple tool bar. It's what I just said, it's save, print, move back or forward one page. You can switch between the different drawings. And then we're going to try out the white board. So as you can see we g all going to draw a animal. Just to uh uh just to get a bit familiar with it. Mouse wasn't running away. Is everybody is anybody playing with the mouse? No. Okay. We're going to uh draw animal. And uh just sum up a few of its favourite characteristics. Um the only thing we have to uh look after is that we use different colours, and different line width. Uh there's I can start from now. I will. You can use this pen by holding it like a like a little child. Because if you hold it like this, the

sensors will get blocked and then the drawing won't get good. Another thing is you have to be uh a bit slow. 'Cause if you're going to draw like really fast then um the pen won't hold up. So we choose form of current colour uh I think grey is appropriate. Then the line width. I think seven will be nice. Now you'll see my drawing capabilities. These are not very much, but uh Uh, see you have to do it real slow. Oh Ah I was trying to draw a dolphin, but I think his nose has to be a little bit But it's close. So what yeah it's this is bit of the swordfish. Yeah, he hasn't got an eye. Woah. Now we've got another function. We've got the eraser. And then you can undo this easily. Ah it's okay. And I've got to write down a few of its characteristics. Uh is They've got no text tool, no. Uh. Okay. This is typically a undo action, I think. Pen. Maybe you have to hold it a bit upside-down. I think that's it because if you wan ar are going to do it like this then it will be a stripe. But I don't know, I'm just trying. This is not my work, okay. Maybe you have to use Oh. Uh. I think it's a it wants to draw a another animal? I don't know. It lives for the fun. So It's my characteristic uh characteristic about the dolphin. It lives for the fun. So now I'm gonna hand over the pen on the new blank sheet to you. Go ahead. Maybe it's easier to draw the smaller line width, I think. Because this is going a lot better than uh I did. It's nice. Uh. It's a real dead sheep, yeah. For recognition, yeah, I see. Um maybe you can also write your name somewhere. On just a Yeah. Nice. Sweet. Yeah, just a blank sheet. No. Yeah, it's pretty skinny cat. Is your cat, or did you find him on the street? Ah. Okay. That's pretty clear. So everybody knows how to work with the white board now? So if you have any ideas or if you wanna draw anything on the white board, just ask and go ahead. It's pretty uh easy.

'Kay. S haunted white board. So we've got the tool uh introduction. We move along to the project finance. Um as you can see, we um for our remote control, a selling price is uh twenty five Euros. Our selling price. Uh our profit aim is fifty million Euros. Uh that's the least we have to get from our remote controls, so we have to work together to reach our aims. Uh we can do it international, so we have to focus on different kind of users, different kind of cultures, and different kind of trends as well. Um but that's all in the later stadium. Our production cost um can be maximal twelve and a half Euros, so that's also a point we have to keep in mind, that we won't make remote controls with small televisions inside, and stuff like that. It won't work. So just try to remember these points. Selling price twenty five, profit aims fifty million um, but more important is the int international market we're trying to focus on. And production cost uh maximal twelve and a half Euros. So that's leads us to our little discussion. We've got about five or ten minutes left for discussion. So I'm gonna sit down, I think. It's easier. I've got a message. Five minutes. Okay, that's uh good timing. Uh maybe you have to say the magic word. Does it do anything? Maybe you have to just clap it down? Mm back up again. No slide show. Hmm. It's off. Now you have to put it back o Oh yeah. You'll be okay, I think. Well it's those laptops. Nice. Okay. But so mm does everybody has um experiences with uh remote controls, and I mean not the ordinary mote controls, but also a little bit different ones? Like you can use for other? No? You? Ah yeah. Yep. Yeah I've I've got one at home. And you can uh program I think eight different devices in it, and you can use it for your television, anything else. And it also operates on infra-red, so you have to got the little device inside your room, and then you can operate it from the third or th or second floor. So that's pretty handy when you have a video recorder or D\_V\_D\_ player downstairs and you've got a link to your T\_V\_ on the second floor. So that's a pretty handy um thing. Um but only the I think that if you can put different kind of devices in one remote control, it makes it a lot easier as well. It's uh That's good to remember. Yeah, that's nice, I think. So we've we want different functions uh and we can maybe see if we can do something with the infra-red. But I don't know if that will exceed the production costs. So that uh that's something we have to find out, I think. And other functions for a remote control? Maybe we can make it

uh uh Shock proof. Sure. Waterproof. Okay. So these are our um a few things we can think of. Um I will put the minutes from this meeting uh in our project folder. That's a battery stays. Yeah. Uh. That's an idea as well. Other ideas? Quick ideas. Okay. Any questions about this uh presentation? Kick off presentation. No? Okay, then I'll put the minutes from this meeting in the project folder, and then we can all work. Finish meeting now. Okay. And we can all work uh on our own projects. Okay then I'll meet you in about a half an hour, I think. So good luck. Morning. Yep. My name's Frank. Thank you. Hmm, that's interesting. Sure. Yep. Visit it. Can't say I paid much attention to it, but Oh yeah. Okay. 'Kay. That was interesting. Innocent. 'Kay. I'm thinking about a swordfish.. Meat. Yeah. Hmm. Okay. Thank you. Okay. Gonna use a different line width. And I'm gonna draw in black. There. 'Kay, I'm not much of an artist, but here we go. Mm. Okay. This is my um Hmm. Sheep. With of course little blue dot they always get sprayed on their butts. There. Yeah. 'Kay. They are Come on. You have to go really slow when you're writing. They're brilliant animal animals. And that's just a little me thingy. So. Guess I'll pass the pen to our User Interface Designer. Interesting. A rabbit? Garfield. Yeah. Yeah. And the most interesting tail. Yeah. We're being haunted. Yeah, you got a message. So j

ust on a side note, why is it my laptop is only giving me a black screen? Yeah. Right. No. It's off now. Well, it was on, but Ah, there we are. Well, we have a kind of broad T\_V\_ at home, and a D\_V\_D\_ player, so we got like a lot of remote controls, one for the T\_V\_, one for the video recorder, one for the D\_V\_D\_ player. And I think it's it would be best to just make one remote control that can operate them all. Oh really. Yeah. Yeah. So I think you can take minutes again. Since it's your job. Yeah. Yeah. But that would be really good if we could do that. Um. Think it has to be shock proof 'cause my remote control tends to fall a lot. So Yeah, one other little thing. Thought it might be handy to put a battery status display on it. So you can see how much is left in the battery. But they'll also really drag up the production costs, so think we'll have to see about that too. But maybe just a little LED, I don't know. Um. Nope, don't think so. Okay. Aye sir. Half an hour. Okay.

---

# Meeting ID: 126

Data Source: Train

## Executive Summary

The Project Manager gave new requirements for the product: the remote will not include a teletext function, will only be used for television, and must show the corporate image. The Industrial Designer presented possible components to consider. The group then discussed hard materials to include in the design. The Marketing Expert presented an initial sales plan and showed that there is a demand for remotes featuring voice recognition and other capabilities; the group discussed how it could be integrated into the functional design. The Project Manager offered to help the Industrial Designer find companies to provide help in integrating this component. The designers expressed that they needed more information from the board on their expectations for the product. The User Interface Designer gave a presentation on product design from the user's perspective and emphasized simplicity in design. She also suggested that the group make a decision on which features to include in the final product design, but the group decided to postpone it. The designers were given their assignments: the Marketing Expert will present the marketing concept; the User Interface Designer, the user interface concept; the Industrial Designer, the components concept.

## Complete Meeting Transcript

Fantastic. Titanium. Expensive. I don't know, I think verbally we can we can pretty much sell. Hmm. Uh from her side, I don't think uh there's too many more questions. If you can come to the Okay, from the marketing yeah, from the marketing side, just to to give an idea what the management is looking for, I was looking for a a remote control to have a s I have a sales price of twenty-five Euro, with a production price of uh twelve and a half Euro. For what uh I think from what we're trying to find, we're tr we're looking for, I don't think that price is exactly in the market. Okay? I'll explain myself here now in the sense that uh in a in the recent surveys, uh from the ages fr from fifteen to thirty-five, eighty percent are willing to spend more money for something as fancy as trendy. Twenty-five Euros, uh that's that's a preson reasonable price. That's a market price right now. Now if we're gonna take a risk, and push this up a bit, make it more expensive, but give them added things that they don't have now, then it w it could possibly sell. Obviously the risk is there. Too expensive, they're not gonna buy. But, I think uh there's

one other thing interesting two things that are interesting is that uh from the fifteen to thirty-five year-old group, which always spends more money on trendy new things, speech recognition is requested. And we're talking between seventy-five to ninety percent of this group is willing to pay for speech recognition on a remote. Obviously, we can't make a remote into a computer, but maybe simple commands. I dunno, louder, softer, on, off. That might be a possibility, even though it costs more, to be the first on the market to produce this. Thirty-five percent say they're too difficult to use. So we have to figure out a way of making it um more user friendly. Uh fifty percent say they can't find the remote half the time. So maybe one word speech recognition commands, say remote, and there's a beep beep beep, and they can find it through, you know, ten tons of newspapers, magazines, whatever you have at home. But, in the cost that uh the management is looking for, that's not gonna be possible. But if it's trendy, if it's fancy, it's got some colour to it, if it's very easy easy to use, if it's got simple remote speech remote uh control, like I said, louder, softer, change channel, on, off, remote, it goes beep beep, I can find my my remote without spending half a day looking for it and getting all upset 'cause I can't turn the T\_V\_ on. So we're gonna have to look at it in a in this global idea, with the ideas of the industrial uh design. But, price obviously we have to talk about. Speech recognition. Mm. Because tha w with speech recognition uh th I'm not that good at that idea but th if it's a one-word recognition, 'cause I know with telephones and cars and things I've seen in the States, a friend of mine says call Mom, and it calls up Mom. 'Kay the radio can be on and everything. Because I think s with speech recognition, if uh the the remote or like the telephone it has a exact word that it has to hear. I don't think it would come through a sentence in a television. If somebody's speaking on the se the television, they're not gonna stop and say remote, okay. So I think that uh something could be designed to recognise single word Like the t like the telephone. No because I this is this is years ago in the United States where we're driving down and he said call home, and the telephone called immediately so well, that's kinda cute. From from your side uh, you're gonna have to go back the management and s be more s precise. What do they want? Uh, a risk, take a risk on the market? Something that's gonna cost more, but could very easily s make a boom in the market? Because it has to be something totally different, has to be total totally new. Something that nobody has right now. And it's gonna cost. Mm-hmm. Sure. Sure. Obviously. If the bottom line is positive. Mm. Mm. Yes. Mm. Hmm. Individual actions.

She's objecting. Oh th we s we still have Yeah. Right. Agreed. 'Kay, do you wanna open the I'm number two. That's it. I'll do the notes. Yeah, thanks. So um well I I figured uh we should um identify some user requirements, and from my experience, I wanna uh, and from research I did, uh the the device has to turn the television on and off the first time you press on the big button, you can't uh can't have like uh waffling on this point, you know. Really have It needs to be able y y have to be able to find it. Because one of the biggest problems with remote controls is finding them. So uh, I also, since we have to establish our corporate image on the basis of this new product, thought we better look at things that are popular and um ex go beyond those, and, as I said in the first meeting, um and then uh we might wanna talk eventually about the materials that are appropriate to use in uh in the construction, especially in the the uh the outside of the product so that it gives the appearance, and it is reliable, and so forth. I did a little history on uh the the uh remote controls and when they were invented and so forth, so, I guess this guy Zenith uh created the Flashmatic, which I kinda like the idea, 'cause it made me think of um um maybe the remote control made a big flash when uh you turn the T\_V\_ on and off, that might be interesting. And um so it was highly directional flash light that uh you could turn the picture on and off, and the sound on and off, and change channels c so I think um those are still requirements we have today, uh fifty years later. And uh it was really a pioneering innovation, but it was uh sensitive to

the sun, so that uh it would get would start off by the you'd get it would easily cause um problems. So, uh I in addition to uh looking at the um uh the functional require so all these devices are examples of where uh mm they represent examples that are available today which I think the one in the middle is r um really uh something to keep in mind. It'd be easy to find. And um it would uh y you'd you could throw it at things if if the T\_V\_ didn't turn on and off, you could use it for something else. And since I'm not really um Industrial Designer, I didn't really know what to do with this slide. But um I just took some different uh schematics and I put them into this, and I guess this is what a slide might look like if you were drawing a circuit board. I don't know why um we were asked to do this. So, uh personal preferences, um I think we could uh I I'm really thinking outside the box here, and I think that we should consider perhaps having an an an a a size uh a remote control that changes in size depending on the user preference. So something that's very very flexible and inflatable and then you could shrink it. I think um it could either be you could go either one extreme, be very colourful, or you could make it clear, and um kind of blend in with things, so you didn't have to um uh have a problem with the th the decoration of the of the user's home. Um I think uh it needs to be waterproof, because uh sometimes they fall into cups and, you know, it might be out by the swimming pool or something like that. Um if you uh mi one of one of my requirements was about needs t to tell you when it's done its job or not, because half the time, I keep pushing on the remote control, and I don't know if it's actually understood my message, so I think it should give you some sort of an oral cue. And uh, course I never wanna replace the battery. So, that's those are my f preferences, and that's my presentation. Yes. Run over it with a car. Good idea. Good idea, I'll I'll uh um Yes, very good. Hmm. Titanium. Titanium would be be heavy, too, wouldn't it? No, I haven't really um I wanted feedback, I think we need to rate rank these, but we'll see what your uh personal preferences are and your thoughts. I like titanium. It's light. Uh yeah but uh who who said who said we were, you know, nobody told me how mu what our fi

nancial objective is, so um It'd be hard to inflate something ou made out of titanium though. Not fat? Not fat, huh. Might be hard to find, though. Oh, okay. Speech recognition?. D uh I'm sorry? Well, uh training is always an issue with uh commands. So um might uh we can perhaps um do it if the user is willing to spend some time in the training process, uh it could reduce th th uh the overall um cost. Not sure how. But um anyway, um I I think also that uh this might impact the battery life. And um so, maybe what we'll have to do is um add something where you can um recharge it wirelessly so that uh y you know sen send power to it. So uh or maybe uh set it out in the sun and it uh, you know, gets uh, from the light, um a a solar cell inside there so that uh you have enough uh juice to do all these fancy things. Off. Very good point. Okay, we'll find that out. Oh, it's um, seems very understandable. Clearly your research and uh and ours uh heading in the same direction, and um uh the only thing that I saw missing from uh your your research that we found was this uh ability to find the doggone thing when you need it. So uh, you know, but that's okay. That's why we're all here at the table, so that if we think of it and our research indicates certain things and um w we it's complementary. I also think that um uh th f the the feel of it is uh, when you hold it, is something that um uh was expressed more in in in in my uh design and that's logical and normal 'cause those are the parameters that an Industrial Designer's more thinking about, th th the look and the feel, and uh, you're First. Yep. Mm-hmm. Okay, so I don't have any questions. Sounds good. Do you wanna go back and look at the closing slide, maybe that would provide some guidance? Doesn't really tell us. Well it says individual actions, it says user interf so I'm supposed to do the components concept, supposed to work on the user interface concept, and you're supposed to keep watching the trends. Um and specific instructions will be sent by our our coach. I think we should do as many features as uh start with all of them right now and eliminate them later in the process, that's

my suggestion. You can object if you want to I think we should take that as an action item for after the meeting, 'cause w our meeting time has run out. Somebody else has go to use this room, and, you know, we can't hang out here and talk about this, so Thank you very much. Okay uh Agnes, you can help me for the slide when okay. Okay, welcome back. I hope uh you have a fresh head and a fresh time. How t now the meeting actually we gathering here to discuss about the functional design meeting. Okay, and uh we'll issue some information from uh all of you. And it's in the, I think uh, in the sharing folder. And uh I will invite uh the Christine and the Ed and uh Agnes to discuss about on the various subjects. So can you go to the next slide? Yeah uh the agenda of the meeting is opening. Then uh I'm going to talk about uh the project management, what I'm going to do, and uh, of course, I'm doing the project management and secretary both, okay, to take the minutes of the meeting. And there are three presentations. One is uh new project requirements. And the second one about uh decision on remote control functions. And uh finally we are closing. Uh and the meeting time will be uh forty minutes, so you have to be very quick. And I have come up with the management come with the new proposal, okay, and I have to discuss a few points on this. Uh both says new insights in the aim of your project. Uh the one is uh the teletext becomes uh outmoded, okay because if uh because of the computer systems and the new technology. So we don't need to consider really about the teletext all in our new project design. And the second one is about uh the remote control. Should be used only for the T\_V\_. That's what our uh management says. And the third point, it's very very important to establish our uh marketing or uh corpo

rate image, okay, with this new project or new product. Okay. So I will invite uh Agnes, can you go to the third slide? Okay,. So, I'll invite uh Christine to discuss about uh the functional design. Yeah, let me uh interrupt you uh if you can add other facility, other feature, like uh unbreakable. Okay, because uh especially today, you know, you have the family and the kids, okay, and the kids throw it and they they play with their remotes and. Yes. Okay, so if you can add the feature, okay, for your uh fabric whatever in your outline design okay, with unbreakable, okay, I think that will give a lot of advantage for our product, if I'm not wrong. Maybe you can uh add it in that. Okay, uh thank you Christine, and uh uh any questions or uh clarifications, or any discussion on the functional design? Yes. Yeah so Yeah the the I'm sorry because uh the last meeting we supposed to discuss about the financial thing. Uh let me go quickly, maybe if I can go back. I know the project plan and the budget. So I can close this, not sure. Was in uh S This. So let me see where is this file. This is Christine. That's yours, okay. Saving. Okay, uh I will I will send you a mail, okay? The project may be the the project aim, okay. At the end of the day, the company uh wants to make at least uh the fifty million Euro. Okay, and uh of course the price will be very reasonable on the the sales side. Okay, that maybe Eddie will talk to you about uh how much uh the price and uh what's uh how much its cost for the manufacturing and how much it's going to be we sell in the market. Okay. Then uh you can come back with your feedback. And I I have one maybe the suggestion or opinion. This remote control, okay, it can be for like universal, to use for any T\_V\_. Okay, and it will be slim, okay, and uh Not fat. Okay. Yep. But let's try it, okay, with the different uh the designs, okay, the functional designs. Okay? So any other questions? Okay. Thank you Christine for uh time being, so then uh Ed, so can you tell about Mm-hmm. Yep. Yep. Mm-hmm. Yep. So what do you think about uh the design? Do you think you can make it or uh What do you think about uh the design, uh what he was talking about of the speech recognition? Mm-hmm. Yep. Well, what I can uh suggest to you, Christine, okay, uh if you need some uh the technical feedback, or some training, okay, about uh this facility, especially for the speech recognition, I can recommend you some companies like uh Intel or I\_B\_M\_, okay, because they're already in this uh speech recognition part,

okay. And uh you can maybe have some uh technical backup from them, some kind of a technical tie-up. Okay, and uh if you want, I can coordinate, okay, to get some information, okay, and uh you can uh let me know, okay, so what kind of uh the details you require okay, to add this feature in this project. I don't think it's uh the difficult. And uh we need to know how much is the timeframe you need to develop, apart from uh what today. Yep. Yes. Yes. Yes. Yep. Yeah but but end of the day, you're the sales guy, so I will come back and sit on your head because uh you are going to give your sales projection, okay. It's uh of course it's uh good to uh tell the management how much it's cost us and how much you are going to benefit, okay. And uh, so I don't mind to convince, okay, the management to spend some more money on the project, okay, if you can make out of the money from this project. Yes, okay I don't mind to convince the the management, okay. The management says, okay, so they they don't want certain facilities, which it's already worked, okay, they want something uh new, okay. I think uh like uh speech recognit definitely they will agree, I don't think they'll say no for that, okay. And uh I hope I can convince the management on that, okay. So if you have any uh new ideas, okay, for uh your you can always come up and uh you can tell me if you need any uh s special, okay, coordination, okay, between any uh technical companies

, which you can uh hide their technology backup, okay, for your uh functional design or technical design, okay, then I am ready to do that. And uh what's your comments about uh Yeah, so you are finish, Ed, uh so I can uh Okay, I'll uh hand over to Agnes. Just gonna close this. T Uh where are you, here? Participant three. Okay, so I'll yep. Okay. Is it okay? Alri Click mm. So for anybody need uh any help, for time being, on this uh subjects, okay, so please come back to me, and uh Christine, maybe I can uh try to help you to get some uh the technical uh the companies to help you for uh make a design uh slim, okay, and to add some features, like we are talking about, the speech recognition and all. Yeah. So not really this one we are talk ab Yep. Okay, that will be great. And uh I'll send you the the minutes of meet Yeah. Okay, what we'll do is now we'll take for lunch break, okay, then uh we can discuss furthermore, okay, with our areas, and uh then we will come back again in the in the next meeting. So thanks for coming and uh I'll send you minutes of meeting, and uh please put your all information in the sharing folder so everybody can share the information. Okay? So let's go for lunch then. Thank you. Yep. Sure. No, this is the third slide. Sure. Um. You're participant s Two? Do you want the mouse, or do you want me to Mm-hmm. Do you have any preconceived ideas in terms of materials? 'Cause, for example, in the unbreakable thing, doing something plastic would be harder, whereas having something like, I dunno, steel or titanium isn't really economically viable. Yeah. Yeah. Sure, yeah. No, I just wondering whether that you had any sort of Yeah. The marketing comes out. That's Christine's. And that's mine, I think. In modified. S 'scuse me for one sec. Hmm. It seems also like with the speech recognition, yeah, it's a great feature, but if you're watching T\_V\_, there's a lot of ambient sound, and it's words. It's not just, you know, noises like something hitting. It's actual speech, so then you have to make sure that the speech recognizer is good enough to filter out the T\_V\_ speech, and the the user's speech. Otherwise, you can say remote. But if someone on the screen is saying the same thing, all of a sudden, you have someone in a movie saying off and your screen dies, because they've triggered the remote control and it's turned off your T\_V\_. So, I think if we can find a speech recognizer that can handle those types of problems, then yeah, it'd be a really good marketing gimmick. But, I think we seriously need to consider how that would impact the situation. Mm-hmm. Yeah. Yeah. Mm-hmm. Mm-hmm. Oh yeah. Yeah. No, I think it's a great idea if we can design it to suit those requirements. Yeah. Um well, I mean, maybe if I go through my presentation, you can sort of see what the user perspective is, and how it ties into the other two comments. Mm participant three.

Nope, here Good. Thanks. Yeah, and that's fine. Okay. So, basically, the method that we usually use in the user interface design is that we need to look at what people like and what people don't like about existing products. So, in our case, existing remote controls. And then, what the good ideas are, and what the bad ideas are, and why they're bad and good, which isn't always as obvious. We seem to have intuitions about why things are good or things are bad, but when you look, technically, at how it works, sometimes that's not the case. Then we need to decide what functionalities we really want to keep, 'cause that'll feed into both Ed's work and Christine's work. Um and then what the remote control should look like, obviously, once we've got a good idea of what the functionalities are. So, in terms of the functionalities that we need, you obviously need to be able to turn the T\_V\_ on and off. You need to change channels, both by directly going to a specific channel or by channel surfing. You need to be able to control the volume and then control any menus on the T\_

V\_ to regulate contrast or whatever. So, the problems that people have expressed is that there's too many buttons on remote controls, in general. The buttons it's not clear what they're supposed to do. Um often, you need to know specific button sequences to get certain functionalities done, um which you don't necessarily always remember, especially if it's a functionality that you don't use very often. And that the buttons are too small. So, here we've got two examples where here on the left-hand side, you can see a remote control that has lots and lots of buttons. The buttons, in a lot of cases, are tiny. Um they're hard to see, and okay, they're labelled, but the labels don't necessarily tell you too much. Whereas, on the other side, you have a much simpler remote control that I think basically has the minimum functionalities that are needed. And it sort of looks simpler and just less imposing when you first look at it. So, I would be inclined to go sort of towards this, in terms of design, rather than this. And if there's specific functionalities that require more buttons, then we can figure out how to do it with existing um buttons. So my personal preferences are to keep the number of buttons to a limit, or to a minimum, sorry, make frequently used buttons bigger and more strategically placed, so like the on button being really obvious one, the channel changing and the volume, and to keep the design basically sleek and simple. Which, I think ties into what Christine and Ed have both said fairly reasonably. Um so, that's pretty much it, and I don't know if you guys have any questions or Yep. Yes, that's true. Yeah. Yeah. Mm-hmm. Yeah. Yeah. Oh, that's definitely a very important factor, especially to users who are gonna be buying the thing and then using it almost on an daily basis in a lot of cases, I think. Oh Should we maybe make a decision about what features we actually want to include, 'cause we've thrown a lot of features onto the table, but do we actually want to incorporate all of them, or have we missed anything? Sure. Mm-hmm. I thought No, I I'm just thinking in terms of time, like if Yes, now I'm objecting. No, I mean, I was just thinking is it really practical to start designing something with features that we're just gonna end up throwing away? I mean, it takes a lot of time and effort for everyone to consider different features, um and s if we spend that time and effort on features that we're not gonna use, maybe it's better to spend it on the f thinking more about features that we actually do want, but I guess Sure. Yeah. Yeah. Sure. Okay.

---

# Meeting ID: 19

Data Source: Train

## Executive Summary

The Project Manager reviewed the decisions from the previous meeting. The Marketing Expert made a presentation on trend watching, including trends in user requirements and trends in fashion. The Industrial Designer presented all the components of the device and announced that several of the features already discussed would not be available. He suggested substituting a kinetic battery for the rechargeable batteries and using a combination of rubber and plastic for the materials. The User Interface Designer presented his main interface design, which included buttons for the most frequently used features and a graphic user interface on the LCD screen for other functions, to keep frequently used features easy to use. He announced that speech recognition was still an option to consider, depending on price. The Project Manager then began a discussion to decide what was going into the final design. It was decided that a kinetic battery would be used in place of a rechargeable battery, that the remote will feature an LCD screen and rubber casing and rubber buttons, and that interchangeable rubber covers in fruit colors will be available. Speech recognition may be included if it is not too costly.

## Complete Meeting Transcript

Oops. Mm. After lunch. Yeah. Mm-hmm. Mm-hmm. 'Kay. Yep. 'Kay. Yep. Fine. It's okay with me. Yep. Regarding those sizes, which one you think will be light because we we have to take into consideration size also, so maybe a standard triple A\_ might take lesser space or and dynamo might take more space. Uh Right. Night. And are these like uh what are the life of the kinetic battery, it like it runs for long time? Mm-hmm. Okay. We c Solar would be slightly expensive. It's twelve point f Another question is like sorry. W w which one would last the longest, because we don't want customers to be like you know charging like a mobile phone every day. A remote control, like, so we have to s look at the life also. Okay. So Mm-hmm. Okay. Second thing is yeah and second question is like, a mobile you can change the cover, you call it a skin or whatever. So in this case if you're looking at like a customer can change the colour like from green, parrot green to chilli red or something like that. So is that feature available in like uh titanium, or it's like only specific to plastic or Mm-hmm. Yeah. Something like Alright.

That could be a good idea. It could it would be comfortable to hold on also. Sorry I didn't get the last part, you're talking of Just what you said I I didn't get the uh meaning of it completely, you're saying like Uh-huh. Okay. 'Kay. Absolutely, f for somebody who very often, if he would a person who switches channels very often or does use a particular function very often will find it very irritating to use a and he might spoil the touch-pad very fast compared to a button like, if you keep punching with an pointer or whatever. And just one small question before like you are, regarding the circuit, since we are having a flip-top, we can customise the two circuits for different type of buttons like we are keeping the standard buttons on the top and the more complex buttons under this thing, so we can divide the circuit like you know. Mm-hmm. Okay. Okay. Okay, uh would like to share something which I did here. First thing is uh basically on design we just took the input from the previous meeting, especially from the marketing and industrial design, to check on the customer needs and feasibility. Second is we checked into competitors, the picture here shows one of the standard models offered by competitors here. So y you generally see there's not much of variety and like marketing team said uh, people need trendy, they are bored of black and white. So you generally see rectangular shape, very monotonous kind of designs here. And uh second thing is there's too much of confusion here. No particular remote is standard. Like, some some people have a Here you see this? This is on a I I found th that uh only common feature is the ch uh channel control and uh volume control, rest other buttons, they are in a very disorganized and they are not consistent th with other models and all. Okay, and second as already discussed with William, we are going to have m maybe a G\_ G\_U\_I\_ interface in the f in the middle of the flip-top and g graphic user interface basically which is what we d do in computer, have icons or touch pad or whatever, which is Like you have on a I uh icons or something y you have is a good example of G\_U\_I\_ graphic user interface. So basically not point or click Press any particular device, he just has to click on that particular icon to simplify. And on the top m repetitive buttons which are like volume or channel changing and all could be on the pointing device, that means the use of button. So he need not use a pointer to keep changing the channel if a person is frequent surfer. So we are having a combination of boards, so f on the s simpler board, on the top we have this button, rubber buttons, to keep frequently changing the channels. But Mm-hmm. Okay and you mean to the And the lower distance. Oh f perfect. So the findings are too many cluttered buttons. Repetition of certain but buttons which I already exp

lained, example the volume and channel control buttons. All are confusing and in inconsistent. Okay we had a latest finding of voice recognition, there was a mail which mentions that our division has developed a new speech recognition s feature. We have to check into the for financial f feasibility whether we can incorporate it this at a low cost, but for like we had g um s response from the customers that they would like to have the feature of finding it. So it could be like, where is the remote, and the remote answers I am here. Some kind of thing or it gives a b bleep sound or some kind of sound and if this can be incorporated this would be more uh you can say trendy also? And technologically innovative also. So we we can check into the financial feasibility of incorporating this. My personal preferences would be like, as already uh marketing department, they want something to do with fruit so I wouldn't say the design should be like a fruit, but yeah we can take inspiration from fruit colours, like the vibrant colours, uh red chilli uh tomato red or whatever and second thing is cer certain standard buttons we should have, like for example, i if you see the previous slide uh I think most of the users would now be well acquainted with this cer central pattern, here, so we we we would not change h that particular pattern because i this is the most consistent thing in all remote controls. This is central one, the one you yeah volume and channel. So keep that m that standardised because that's the most

common feature across all models, if you look at all the models, it's here. This and voice recognition. The kinetic. Mm-hmm. Maybe we could start with the black and white. That that way we could upgrade later. Mm. Mm. Yeah. And for the sorry. For the body design I think plastic, uh w yeah we could use the body, for the inside and uh rubber as a padding or for the grip, something like to add to the design. Plast right. It's Uh I it's different. Right. Acupressure, you could talk of acupressures. And finally the body should be retouchable, may maybe ch you can change the body or the case casing the case outside, it should be moulded it with the design in such a way you can change it every time. Okay. The rubber. Fine. Yeah. Fine, uh we were talking of voice recognition also because that we are not for how to look it uh remote control if it's lost. So, are we looking at voice? Or maybe like uh William was suggesting in the last thing some devices you put on key chains. For I yeah, the whistle. So we can if financially voice recognition is not feasible we could go for a whistle. Yep. Uh sorry I didn't mention this, but we'll be incorporating in the design. Fine. Mm-hmm. Yeah. Again a questionnaire huh? I think we are pretty going in a clear direction now. Yeah, yeah I was getting that impression as well. Etcetera. Yeah. Yeah. Yeah, okay. That screwed in? Yeah. 'Kay, Okay. Um this is uh all about the design of the actual components and the availability of the components we have in stock at the moment. Okay, first uh the Into the method. The the main idea of the whole thing is just so you sh you just press buttons and it should activate things on the T\_V\_ and we discussed last meeting that it should be easy to find. Um also in this study I've looked into the availability of some of the materials, 'cause some of the things that we looked at last time aren't un unfortunately aren't available. Um, findings, I've got my nice little picture there. This is uh the chip called the T\_A\_ double one eight three five which is what's used in pretty much every remote control 'cause it sends out standard signals, based on your input and um it's pretty much used for all all T\_V\_ remotes at the moment. Um and then we we're loo looking into battery options. There's um actually no rechargeable option available, so we I saw the um the standard double A\_ and triple A\_ which we thought were a bit bit too bulky at the moment, dynamo charging, I thought that

that might be a bit silly to be to be honest, people won't it's it's basically like wind-up radio. So you wind up your remote control before you use it. It might You Yeah, yeah, oh yeah I presu you wouldn't have to wind it for very long, but I don't I don't think it's really sort of necessary when you th you think of the next two options, like the the solar charging, 'cause most people have the light on in the room anyway so they could get when when you got T\_V\_. No. Is it? Alright i Yeah it would the d yeah the dynamo would take more space 'cause you actually need a physical sort of handle to wind up. Yeah, okay. But Yeah and most people most people also watch T\_V\_ in the in the night anyway. But I I think I think the the next one's the best anyway. The the kinetic charging which is like you get it in r you get it in wrist watches and you d you don't even notice it. I mean the amount the amount of probably moving around you'd be doing all the time would would charge it up, I don't think you'd ever need to actually physically start shaking it up to make it work. Um yeah it's it charges into um some form of it's a smaller cell which it charges into and uh the si the size sort of a watch a watch battery, 'cause they use them quite frequently in watches. And that'll that would I would last for um well I do I d I'm not entirely sure how long it would last but I've never seen one run out. Yeah. Yeah and Yeah but then again I I think it is because if you think about it, the watch, although it's only a tiny amount it's it's um it's always moving for the whole day and they don't run out over night when you leave them on the side. And th for the same the same reason, you're only using it for a v incredibly short amount of time just to send the signal and then you're finished with it and you put it no no I do I don't think the the draw on it would be Mm. Ye yeah I think I th uh g y you could have a dual um power thing but the the thing with the solar cells is you

would need to put them on the case and they because, if you lie on a calculator they they're quite big and they all they all look identical. They're they're expensive, they don't Yeah the normal batteries would be the cheapest I'd presume then it would actually be the the solar charging ones, um but the It's I think they're not very resistant to dropping, 'cause if you drop stuff yeah if you if you have y the size you'd need to charge a remote wouldn't be that big but I mean if remotes always get thrown around and stuff, so. Y I think yeah, practically. I mean calculators you don't really throw around a lot whereas remotes you do, they can't Yeah they do, they yeah they've got dual things, but they're the batteries are smaller I think. Mm. W m yeah so the Yeah the the s if you if you had something du uh using the standard batteries and the solar charging, um, I don't think you'd I think the it would d well you know how long the standard double A\_s would last in or triple A\_s would last. Yeah I think i I think it would, yeah. Yeah. Yeah. Yeah. Yeah. Okay. Okay, well I'll move on. Um, my second part of my findings uh the mo most current remotes use this silicone uh P\_C\_B\_ board which pr printed circuit board, which basically has these contacts that are really close together and then when you press down on the rubber button, it'll connect the circuit and each each switch is connected to two uh different legs on the chip and so sends a different message and that then uh gets translated by the chip into a code and then it's fired out of this L\_E\_D\_ in the sequence of I on and off bursts. Well well this the thi the thing about is um they they can be as big or as small as you want them to be because you can you can print circuit board like that that it's it's simply spaced like that so you can have fit the n the size of the nine buttons in. If you if you see how thin the tracks are, you could you could s you could put them virtually right next to each other and have a

much smaller switch on each one, if you if you wanted to but um the there is an option to do to do it like that, or you could have some sort of array of switches which I'll speak about in the next bit so that And then to uh yeah, so to conserve battery life the remote should be in a standby mode no while not being used. Now what I was thinking about that was 'cause sometimes when y when you have these things, they've got little lights on behind the buttons, so you can see what all the buttons are, like on a mobile phone, they do it more often than on a than on a T\_V\_ remote, but you could you could have lights behind the buttons and um after like five or ten seconds of not being used I'd have that turned off, if we decided to go for buttons that could light up. Um, the case material, I've a been sent what the factory can actually give us, the there's the plastic which I think we were gonna go for anyway as the main case case housing and the the main problems with the well you could go for wood but I think it would be a bit impractical. Titanium um very expensive just to process, which to make it is expensive, and rubber, well you're saying that people like this uh spongy feel this year, so perhaps uh some something made of rubber, but I was thinking more of the buttons, because the buttons which they've they've said that they've they've put across are what is used in some stress ball manufacture and it's meant to be anti R\_S\_I\_. I'm no I'm not sure how that would work because surely your fingers would still be moving over the short distances but that's what they said. Um the problem with the casing is that uh there's quite um there's quite a few design restrictions that they've got on the shape of the case. If you go for titanium they can only do a standard box shape, whereas if you come to plastic they can they can be a little more they can they can do sort of curved shapes. But whether whether or not because we'd have it in two separate units for the flip phone. Yeah. Yeah I th Uh. Yeah in in titanium I don't I don't think it would be available at all really, the ju just it w well you could make it available in the titanium, it was just it would be so expensive to buy a new case for it, because of the expense of how much titanium is is it's light and strong but I think it should be left for aircraft design rather than for for a remote. Yeah, yeah. Rubber, yeah. And you can peel them off yeah. Yeah. Yeah. Hmm. T Yeah. Also the just just going

back to the interface designs with the buttons, the I know we were planning to do some sort of touch screen. Now what I was saying before about instead of having you could have just a bare P\_C\_B\_ circuit board and I'm sure you could probably get it in different colours and so just by touching it with your finger it'd make the connection over if you had them close enough, that would be one option. Um the second option they offer rubber buttons, but I thought that an L\_C\_D\_ type of screen 'cause one they're incredibly thin um and don't take up much space, two they you can have them in a sort of array and you can arrange the buttons on the screen in a sort of set thing and you could have them like a touch display. Uh what what Oh on the on the L\_C\_D\_ screen you could because you could fit it the problem with it basically is that it's flat and so you can't do lots of curve curved things with it, but um you can you wouldn't have with the L\_C\_D\_ you'd have the wires coming off, you wouldn't have that with the with the L\_C\_D\_, you'd only have that with the printed circuit board. With W also with the Yeah. You could have a flat screen inside, yeah, but I'm just wondering whether we want an L\_C\_D\_ screen inside. It wouldn't be like full colour, it would just be black and white, but there'd be touch touch buttons, so you wouldn't be pressing down on 'em, w or we could have rubber buttons which are made of this material which is anti-R\_S\_I\_. Is rubber. Mm. Yeah I hadn't I hadn't really thought of t

hat to be honest. Yeah you could, you could have some sort of stylus that you could pull out but I I think they could get a bit easily lost, 'cause I had Hmm. Yeah. Yeah. Yeah. Yeah okay. Yeah that's yeah that that's the end of m my Yeah. Uh yeah. Yeah yeah that that would be fairly simple, I mean you'd you'd actually have two separate you'd have two separate circuit boards but they'd be joined by wires or like some cabling between them, 'cause in the in the actual flip bit you'd have some linking. Mm. Um. Yeah. I mean you can you could do it, you could have a 'cause if you if you just put the full charge through an L\_C\_D\_ display it'll completely blank it out, but I don't know if you could get any mirror effect on it, I'm not sure about Yeah. Yeah. Yeah. If you if yeah if you have like buttons that appear on the screen in this L\_C\_D\_ screen. Yeah. Yeah. Yeah, yeah but you can do it with your thumb li Yeah. Yeah. Yeah. Yeah. Well, yeah we Yeah. Yeah. Mm. Yeah I think I mean if Yeah it is it is qui it's quite a cool feature to have and also if they've got it if they've got these parts already in stock, then it won't be cheap to re-manufacture them, uh or it will be cheap sorry to re-manufacture them. So do you reckon that's a good idea that, where's the remote, I'm here thing? I think that would be quite fun. Yeah. Yeah. Yeah to s th well it's it's not as expensive as it would be if it was full colour 'cause if we've just got a black and white one, I mean they use them in calculators so. Yeah. Well you cou um. K no the kinetic ones come come with um a sort of w watch a battery that goes in a watch. So it's a lot smaller, so it would Yeah. Yeah the well I think were we're going for the L\_C\_D\_ on that one, on the buttons, on the on the on on the top one we're gonna yeah. On the bottom we were gonna have the rubber, the rubber ones, the anti-R\_S\_I\_ ones. Um, okay on we've got the flip the flip-screen, the top one is gonna be the L\_C\_D\_ and the bottom one is gonna be the rubberised buttons. Plastic, okay. Yeah. Mm no. Mm. You can you can just Yeah. Yeah. Yeah, yeah j with these rubber these rubberised ca not the actual uh plastic outside case, just the rubber thing that goes round the outside. Oh yeah, yeah the whistle ones, yeah. Yeah. Yeah, depending on the expense of it. And they've got in stock, so yeah. Yeah. Okay. Did it? I'll wait until you're all um hooked up. Okay. Put it on in that way. Thanks. Okay. Welcome back everybody, hope you've had fun. Right um this is our conceptual design meeting, um I think we're slightly ahead of ourselves from the last meeting, I th I I think yeah um. This is where we talk about um properties, materials, user-interface and trend-watching. So I think we've touched on a few things to do with that already, but we'll just go over it. Um the minutes from the last time. Um we had a couple of um changes in our plans in that we couldn't use teletext, it wasn't gonna be a control for everything um and

that we had to incorporate the image of the company into it somehow. Um we have decided on a leaving out the voice recognition, we've decided on there being a flip design and um a different shape from what's normal. We were thinking a shell, but something along those lines, just a different shape from what's normal, um. You were going to look into the rechargeable batteries and we were gonna think about the port and an alarm for getting it lost, things like that, um and our market was going to be young, business, kind of range. Okay, so shall we start with the first presentation? Yes if you feel it's okay. Yeah. Okay thank you very much. Um let's start from the inside and work our way out. I don't think so, not yet. Um, yes, thank you. I hate those little things especially if you do them on too tight and you can't get the leverage on them to undo them. Okay. 'Kay.. 'Kay. Wa can you explain that? Like a right, okay. How what kind of how I long can you get out of that, I mean can you pick it up and then w

ind it for two minutes and then that's it for the night? Or That doesn't count though does it? I thought it was U\_V\_ like Any, any I'm pretty sure that solar is from the sun. Uh, I don't think it counts electric lights no, but I mean not many you don't want to limit your market. I mean people who live in basement flats there's not that many people, but there are people. Mm, but then it would be charging through the day, I think the point is that it charges through the day and then you've got it charged for the evening. Okay. Yeah I've seen But then if you think about a watch, it's on your wrist so it's on your whole bod it's on your body the whole time so you're walking around, you're doing things, it is moving a lot of the time. If you'd I mean you switch the T\_V\_ on, then you put it on the side, then you pick it up to change it and then you put it on the side. Is it really gonna be enough? Okay. So it's not the draw on it isn't Okay. Like a dual kind of. Expensive as well. What kind of price are we looking at for I presume the normal batteries are the cheapest? Solar. Well they're not designed Practical-wise okay. You do get a bit of wear but don't calculators have a battery in them as well? Mm. Okay, can we add in uh an attachment to closing feature? Can we think about that? 'Cause if we're doing the kinetic thing and it's Well add it in to think about um because, where am I? If it is the kinetic thing and it is small and it is portable and it is a different shape and the kinetic is something people don't do kind of we're doing something original and different um but if you wore it if it's something you could just clip on your pocket then you would have that less, you you wouldn't lose it so much. But then maybe that's looking at someone who's just sitting on their own rather than the eternal battle for control of the controls. No. Okay. Okay, right. Mm-hmm. What kind of things do we have to consider there? Can we what kind of size, does it come in varying sizes or is it just one size and we would have to fit the design of Mm-hmm. Okay. Okay. Mm-hmm. Mm-hmm. Mm. Mm-hmm. Hinged, yeah. So instead of the fascia that comes off being plastic, the fascia that comes off would be the rubber, like those pens that you get with the grip, that you can you can pull that off. Okay. Mm. Well that's been really popular with mobile phones so I don't see why not. 'Kay. Mm-hmm. Mm-hmm. Oh it would be flat inside. Mm. I think it would be good to have a contrast between, if the whole thing is gonna be this rubber thing it would be good to open it up and see something quite fancy looking inside. Now how would you distinguish, if you had it bare, how would you distinguish where you had to press, I mean Uh Like one of the palm pop thing. It would have to be attached. Okay, we'll talk about that so if you finish your and we'll come back to that. That's you, right okay. No. We're marketing to guys as much as we are to women. Well it's a remote control, you were sitting watching T\_V\_ are you gonna want to sort of open it and say oh shit I should go and have a shower and do my hair before I put the T\_ Yeah, no, no. Mm. Okay. Okay, okay. Mm. Mm. Okay. Which means Okay. Okay. Mm-hmm. Can we swap that round so th that the ones that we use all the time are on the bottom part? 'Cause if you're thinking about holding it you would be using your thumbs to press, just like a mobile phone. Yeah. That's what I was just saying, and then have the and then have the

L\_C\_D\_ at the top and then be able to touch that for the other controls, so have the um the volume and the programme, things like that, on the lower side. Okay. I can't see that, is that play and stop and things? Or is that volume and channel? Okay. Right. Okay. Um I'm not sure how long we've got left, but we need to make a decision about um the things we've discussed. So, we agree on Do we agree on the battery? Yeah. Um, that means that there's no function for li the port, you know that it sits in, then

pressing the button then having so we could incorporate voice recognition for the finding it. It's a bi i it's like a g it's a gadget, it's a selling point. I think the only I think the only pitfall that we would have would be how much it's going to cost if that means we have to cut down somewhere else, but I think pretty much we've used cheap relatively cheap and simple things. The L\_C\_D\_'s not cheap. Yeah, okay. And you could yeah. Okay. Do you want like a back-up? Um, okay so we've got battery. The inside components is pretty standardised across the board isn't it? So there's not a really a decision to be made there, um. The buttons what did you give us as our The bare-board L\_C\_D\_ or On the top one okay you've got the touch okay and then Okay, okay. No, it's fine. For the inside. Mm-hmm. Oh I think so, I think so. No I think I we don't wanna be tacky if we've got a kind of different shape anyway um the fact the m the material that we would be using would be cheap, so we could make it red, we could make it um psychedelic, you know, we could make it black and white zebra stripes, but that's not really what we're focusing on, what we're focusing on is the m you know yes. So we could just pick anything. It's just different it's just different from everything else and I mean, I'm trying to imagine um clean looking houses, sort of beige and black um so you either want something that goes with that, which is what's on the market anyway, or you want something that contrasts as you know like you get clocks now that are more of a talking point than an actual clock because they're so interesting and Mm. And you would just have an across the b you would have so many different options that you could do, you could have um a plain black one, you could have sparkly pink glittery ones for your little Mm. And ones tha ones that have rubbery spikes y you know, you could just go so far with it, like a puffer fish, you could just, you could take it wherever, so I think that's quite a flexible thing. Yes. Mm. Yeah. Okay we've got five minutes, um, or that might've been up for a while. Mm-hmm. Have you Okay. Well they do, but I think we can you could well it is, it is, I think you just address that with um advertising. Um, you associate the name with the individual product that it is and that does the work for you. Obviously it'll have a logo on it just like everything, but everything else has a logo on it. The point is that it's got to stand out somehow differently but I think it does, without that so I'm not worried about that. Depending on how i I mean we've got this memo saying that it's something that the company's looking into, so um that seems to make sense, but if it turns out that it's hugely expensive we'd have to cut down somewhere else, then it's worth thinking about. But I think we'll find out more about cost afterwards. Right I'm going to wrap it up there. I got a end meeting now message on my mo yeah so. Um so I think we've probably got it says, closing we have forty minutes so I um think we've probably got about that time before we come back. It's either that or we only had forty minutes to discuss what we just discussed and don't know how long that took. Is everyone happy? Okay. Oh good grief. 'Kay. Oh. Mm. Mm-hmm. Shall I? Okay. We just connect up. Thank you. There we go. Okay um so we decided on our market and so this feedback from the marketing department is really about trend watching. Um the methods we used to decide on uh current trends and so on, market trends, were that we did our traditional uh our usual market research study uh with a hundred subjects and the the general feedback from them is that the most im uh w I'm sorry I'm slightly tongue-tied after lunch, sorry Project Manager. Um we decided on the most important aspect i uh required in a remote control device and we'll come to that later. So that was one of the first things we did. Also with our company um being forerunners in uh

putting fashion into technology

, we also looked at a fashion update um using our consultants on fashion and design in Paris and Milan. Uh so the general findings from that was uh in the market trends the most important aspect for remote controls were people want a fancy look and feel, rather than the the current functional look and feel of remote controls. They also also want a remote control to be technologically innovative, and of course, as we predicted, that it should be easy to use. Now I should point out that the first of those findings, fancy look and feel, is the most important, is twice as important as the second, technologically innovative, which is in turn twice as important as being easy to use. So possibly that the feature that we put first is actually third is still important, but it's third in order of preference for the the subject group we looked at. Okay, um, now the fashion update which relates to very personal preferences among our subject group, um we found from our um consultants in Paris and Milan who des attended all the design and fashion fairs there, that fruit and vegetables are going to be the theme for clothes, shoes and furniture. So should we be thinking of using something like that in our remote control design too? There also seems to be um a trend towards a spongy feel to materials, uh again in contrast to last year. So a lot of interesting feedback there, both from our market research departments and from our people in Paris and Milan. Be interesting to see what our design people make of that. Unless anyone has any questions about that? Not yet? 'Kay. Okay. I know. Does does light charge as as sunlight does? Artificial light? Has to be solar. Mm. Artificial light, no. That's going to I know, different parts of the world too, if we're if we're marketing internationally. Mm-hmm. Hmm. Mm-hmm. Mm. Could I just ask referring back to solar charging, is that compatible with um standard batteries? I mean, could people put standard batteries in but with a s you know they could leave it in the sunlight for solar charging or the two things not compatible? Mm. So that affects the exterior design. Mm. Again it de Mm. It would just detract from the attractiveness of the of the whole feature, i it's not gonna add anything, okay. Shouldn't we do some market research on that first before we add it in because I I personally right, okay. It's not something that's come up in any of our uh focus groups and market research, it's not a thing that people are looking for when we threw it open to the field yeah. But it's something to put on the side to think about maybe. Mm. Okay. Mm. Mm-hmm. It does mark quite easily too if you let it fall. I've got a mobile phone myself which is titanium and it does mark very easily if you drop it. I was just wondering if we make the basic mould out of plastic but have like a rubber cover that goes over, that would give the spongy feel, that also allows us to kind of have different fasciae for the phone. Like a rubber sleeve almost, yeah. Mm. Mm. Very cheap way of changing the look of it and people can just buy a new one if they want to. Mm. Yeah. Mm. I don't s sorry to interrupt, I don't see why the curved thing is a problem, if we for example had a shell, once we open that yeah, so it'd be f yeah, yeah. Have I misunderstood you? Mm-hmm. Mm-hmm. Yeah. I just had another idea, I don't know if it helps with that, but just to do with the R\_S\_I\_. Is it possible, just as an option, when we open it up, people can use their fingers to press the button, or we have inside like a small pointer thing when people want to. Mm. Yeah. They're easy to replace as well, cheap. Mm-hmm. Mm. Yeah just a thought they wouldn't actually need one and they could use anything they've got, couldn't they? A pencil or a pen, so they wouldn't really need a Mm-hmm. I'll just raise another point while it occurs to me, it kind of applies to both our designers here, so I'm not sure how it would fit in. If we flip open, now you know how you've got

some mirrors in nightclubs that are mirrors when you turn to them and you turn away and it gives like an advertising display, you seen those? And they kind of respond to the turn of your body. Is it possible that when we open our flip-top shell it's a little compact mirror and when you press a button it then goes onto the phone display th uh the remote control display thing. They don't look at themselves? Just a

thought. Yeah. I know what you mean, it's with us using the ideas for a mobile ph it's with us using the ideas for mobile phones I kinda got sidetracked onto that I think, okay. trying to think of other features we can build in that wouldn't cost too much but maybe we'll leave that one on the side. 'Kay. Mm. Oh I think forget about the mirror that was just a very quick passing thought yeah. Sorry what does that stand for? Okay. No you'd hold it you don't if you flip it open then you'd be Wouldn't you? Isn't that the idea? You us if we just use the shell as an example again, you open that, you've got your L\_C\_D\_ display there and you've got the buttons there so you're holding it in the palm of your hand, yeah. Mm-hmm. Mm-hmm. Hmm. Mm. Mm. Kinetic? Mm. Mm. Hmm. Yeah, we talked about kinetic charging, we've deci seem to have decided on that, did we decide on double A\_ or triple A\_ batteries? No, one of the decisions we had to make was whether we had double A\_ or triple A\_ batteries 'cause they've still got to be charged this way haven't they? I oh I see. Right, okay, got you. Got you on that okay, didn't realise. Sorry could you repeat that last part? L\_C\_D\_ screen. Mm-hmm. Okay. Mm-hmm, so we decided on a rubber casing for the plastic shell, a variety of designs, okay. and it is just uh although it's rubberised and spongy, apart from that we're just going to go for sort of vegetable and fruit colours, we're not gonna try and make it actually a vegetable or fruit design or anything else, like a shell that we discussed, just go for the colours. Okay. Mm-hmm. The feel. 'Kay. Mm-hmm. Is that going to be this image I've got in my head of something kind of shaped like that, maybe about that size, made of plastic, fits into the palm of the hand, rubberised cover that's spongy. Is that really going to fit fancy look and feel which was the major thing that people wanted, market research, is that fancy? Mm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. I'm just kind of pushing at that to see if you came out with anything else, but I mean I totally agree. We looked at those remotes, I mean they are kind of anonymous, very similar looking things. This would definitely be different enough, I just wondered if anybody could come up with something even more Well the thing is the rubberised covers are going to be s relatively cheap to produce, that if in a year's time we we get feedback from the design fairs that show something else is coming I mean it's so easy for us to just produce that and it can be slipped on, which is another beauty of it. Mm, so can I just recap uh Sarah, for the decisions that we've made, kinetic charging, the watch-type batteries, um L\_C\_D\_ display on th the top side of the flip top, rubberised buttons on the bottom side, we're gonna use fruit and vegetable colours for the rubber cover, the case itself is plastic. That's how far we've got, what else do we have to add to our decisions here? Mm. Yes, it was just, there was just a cost issue with that, but it's a good idea we just need to check on the cost, is that right? And incorporating the company logo? Mm. 'Cause I took it from the feedback you gave in the last meeting from y from y your report, it's not just a case of having a little R\_R\_ hidden somewhere, they do want it to be obvious that it's our product don't they? Since it's the only one of its kind on the market it's obviously gonna be ours. Yeah. Okay. Okay. Okay. Did we I know at the last meeting we spoke about a beeper, I think that was you talked about a beeper for a location, have we just rejected that in

favour of voice recognition then? You got to go through.

---

# Meeting ID: 83

Data Source: Train

## Executive Summary

The project manager goes through the minutes of the last meeting. They have the prototype presentation and talk about the final design, features, and power source, type of chip and weight of the remote. They go through the evaluations, using the a list of criteria made by the marketing expert. They rate each criteria on a scale of 0 (true) to 7 (false): how fancy it is, how handy it is, how functional, how cool it is, whether they would spend twenty five euro for it, and whether they would change their current remote for this one. Next they do a cost estimate for production. In doing this, they decide against solar cells and go with the rechargeable batteries. They keep the regular chip, stick with plastic, put two scroll wheels and three push buttons, and make it a special shade of yellow. They eliminate the turbo button and give the remote a single curve because of budget restrictions. They briefly evaluate the project process and close the meeting.

## Complete Meeting Transcript

Yeah so uh following our decision to uh make a yellow well to make a banana remote okay so we actually have a We've well first first of all we made a an attractive base station uh with a banana leaf uh look and feel um and uh bana sit the banana sits in there k you know nicely weighted so that it's not gonna tip over and um this is the remote itself, it's kind of it's it's ergonomic, it fits in the hand uh rather well. We've got the two uh uh scroll wheels here which you know one on the the left for the uh volume and the one on the right for for the channel and uh underneath we have the uh the turbo button which is in like a nice uh trigger position for you know for pressing quite naturally. This is when you when you uh are scrolling the uh through the channels you can tell it to skip th past channels that you quickly rather th Yeah. Well when you stop scrolling the wheel it stops. But normally with uh it will just uh s stay on each station briefly so you can see the the picture. The T\_V\_ yeah. The s the turbo button. So rather than having uh an extra button for um for the on off switch you just use the turbo button. This is a teletext button. So once you press that then you get teletext and you can use the the channel selector scroll wheel as uh To navigate yeah. Yeah. Well then you can you you have like a little uh number selection thing, you press the the the teletext button uh to move between uh the fields and then you can

just scroll the number back and forth so you have s you go you scroll to seven and then zero zero and then you can uh Well you can you can press press the teletext button and then you then you can you can f Mm uh And this is the uh the infrared uh port. Also the top of the banana. So. And then we have in the uh in the base station we have the the button at the front for uh for calling the uh the banana. Actually they do. That's that's yeah that's uh that's form and function in the one in the one uh object. Yeah. So. But yeah that's um that's just like that's an attractive um base station. So. Okay. It's it's uh it's about the weight of a banana. You know, to give you the correct look and feel. I think a child would try to eat it anyway, so maybe we should consider that. maybe health and safety aspects. Yeah. I don't really know if the solar cells are actually necessary any more if you have a recharging base station. If I was gonna place them I'd put them on the on the top here since that's like uh the black bit but yeah I don't I really don't think it's necessary to have the solar cells anymore. Mm. The what sorry? What do you mean? Ah. Ah. A long time. No no no, it can it should be weeks. Yeah but y people don't like to put it back in the base station all the time people leave wanna leave it on the couch so Ah, okay. Okay. Yeah. It seems to be falling over. Or can move between positions in the in the number. It's all automatic. Yep. Uh. Yeah uh five. Five, maybe maybe maybe six it's it's I guess it's yeah. I'd give it a six like I'd I think it's probably more handy than my current remote, 'cause of the scroll wheels but maybe loses the point for not having you know the extra buttons when you reall if you do need them for some reason but you know you can always use your other remote. Yeah. Well it depends when you say functional, do you mean it does what we want it to do, or d does what it does, you know, can it make you coffee? You know. Yeah. Yeah. That's before Yeah. I have to say four. Well it's not a universal remote. Remember we're focus we're supposed to focus just on T\_V\_s. Well all T\_V\_s but only T\_ only T\_V\_s I guess. Four. Just four. Obviously there are some outliers so Which I'll say five. Yeah. S yeah. 'Cause it's five five seven seven so Uh, okay, definitely easy to use. Seven. Alright, now here's the sixty million Dollar question, well, twenty five twenty five Euro question. What do you what do you guys reckon? Hmm. Uh Yeah. Yeah. I'd say two. I don't want a banana on my living room tab

le, a banana remote. It is handy, it's handy, but it's terrible. Yeah. Yeah, but it's not a positive thing. Well, you know, it's it's handy, it's ergonomic, but it's a banana. Yeah but it says I, I would buy this, so. No, it's I. I would buy S s Still I I'd say two. I don't think I at any stage in my life I would want a banana remote control, really. I can say, maybe there is a market for it, I dunno. Yeah. Okay, so, it depends if uh If I had t if I had to spend twenty five Euro, if that was like my limit, maybe I would buy it. Because the other twenty five Euro remote controls are probably gonna look worse than a banana. And it yeah this is gonna f you know handy to use. Although it still has it still has the word of course at the beginning so I dunno. Um. I'd give it I'd give it a I give it a four now. Yeah. I'd say three, I mean my remote control is kinda at home is pretty terrible. If it was change my remote control of my D\_V\_D\_ player for a Mando banana then I would be more inclined to but uh 'cause it's really bad but uh I'd say a three. It's not very promising but you know we're not young trendsetters. Is there some some formula you're using that says you have to sum them up? Well just leave it at that then. No. I think it it kind of you just lose information if you sum it, so. Well we decided against the solar cells so You mean, charging it by shaking the banana. Well maybe dynamo is like you have to actually Yeah. Well actually that that no that sample speaker is not we we're not using that, we're just using the the very beep simple beep, that s that sample thing is like the voice recording and everything. So Yeah. I say that Yeah. Mm. Well, wait a second, no, it's it's double curved, it's got a c, it's uh Well d yeah it's monotonic but it's got but if you hold it if you hold it that way that's two curved, one on this side, one on that side, but they're opposite sides. This is actually I mean this probably this probably actually costs more than three if you Yeah.

Well no didn't we say we wanted to do a rubber if you drop it? Well when okay. Well we we'll come back we'll come back and see if we can fit it in. Yeah. No, we have two push buttons. Huh. Uh. Okay it's gonna have to be plastic. It's a recharger thing and uh Well I actually did um think about it myself but I thought you know because you could potentially you know you could be pushing it down as you scroll it for a instead of a turbo button but you know the turbo button does add that extra class. You know. So I mean if we're if we're over budget then maybe we could we could rethink that. Yeah. No we're not we don't need anything special for the buttons. Make it plastic instead of rubber. And then we're basically on budget except for you know ten cents. Yeah. Yeah well pl the base station is made out of m many units of plastic. Does that include charging circuitry and everything? So what do we do with the extra profits? Okay. The next fruit. No we have a product which none of us would buy. No it's people in in Milan and uh in Paris that are gonna buy it. We're n yeah. We're not in Milan or Paris. Actually there were a lot of That's 'cause I'm sick of Milan. Okay so um project process. Yeah. I dunno I think we had a fair bit of creativity. And uh but I think one thing we m missed out of this whole process was a um like a focus group with the actual people we're targeting. We needed some of these kind of young trendsetters to come in and play with the banana and you know see if they see if they like it. Because yeah the evaluation for us is is kind of pointless. Yeah. Because it it would also be interesting to uh you to know find out if we have a market in really young children as well, to see you know how to how to market this thing. 'Cause you know if well I mean maybe you don't wanna give all your kids their own remote because they'll be changing the channel all the time but you know maybe in some households where there is you know a T\_V\_ for each kid,

then you know, banana remote control could be fun for them as well. Might have to draw a face on it. So but I think that's something we need to to work on next time is really finding out more about the target market. Yeah. I think there are ways we could maybe simplify the Well just the the the circuit board that we're using inside, I'm not sure really how complicated our um our needs are. I mean all we have is two push buttons and two scrollers, do we really need an integrated circuit to you know to process that. And also fo you know for mood lighting and and stuff, that would be rather cool. I think that's actually something that should be in version two, is the ability to you know to control things other than the T\_V\_ and not just electronic equipment but you know the whole environment of the room. Yep. Okay. Thank you. Okay so we can go to the slides. Yeah. Number three. Oh number two sorry. So final design. Final design. Okay so Michael you can go ahead. You can pull it out first, maybe. Uh And we we do have one more functionality. If you take the banana as such and uh you press the turbo button, so it switch ons the switch ons the T\_V\_. The turbo button. Additional button. That's right, that's right. So then then both the scroll buttons they are for teletext browsing. And you can tele yeah, once you press the teletext button then the scroll buttons they are more for teletext, they are no more for channel or vol volume. Yeah. That's right. Yeah. Yeah. Yeah. So it always means, whatever the rays goes by they they get reflected and then you are having a better coverage. It's like antennas. And for the power source we are having solar cells and rechargeable batteries and this and uh the basis station is going to have the input from the mm power line for for charging the batteries. It is very light. Yeah. And we have put these different colours so that people don't mistake them mistake it as a banana. Otherwise it's you know a child comes and so Yeah. Mm-hmm. Oh we didn't think of that yet. Yeah. Oh yeah that's right. Mm-hmm mm-hmm. It'll It'll be always at top somewhere at there. Yeah because now we are having rechargeable batteries so that that is. Eight to ten eight to ten hours. N most no most of the time it's not being used. So when when you are making it on Mm. Mm-hmm. No eight or eight or ten hours of working. If you are just leaving like that it'll be much longer. Yeah. That's right. Yeah. And we are having

the speakers regular chip for control. Pricing is was a factor so that's why we have gone for a regular chip only not the advanced chip. And uh that's it. That's right. You want to have more functional buttons? You are not convinced. Not not many, we we want to keep it simple. So that this button fo is for teletext which is usually also the case, that usually there is a teletext button and once you press that, the channel buttons, they baco become the scrolling buttons. It's up to you, means. Now that Means let's say this this can move the the larger digits and this can move the smaller digits. That's right. Yeah. So there was there was a constraint that the surface area which we have on this banana on one side because of the shape. So we are targeting a segment which is which is just very trendy kind of thing, they they don't care about the buttons any more. And anyway Evalua yeah. Why this strange factor of seven? Usually I have seen that scales are from one to ten. Okay. Okay. Mm-hmm. Okay. Okay fine, got the idea. Okay. Okay, okay, great. Okay. Yeah yeah. Go ahead. Mm-hmm. Sure. Okay. Yeah yeah. Yeah. So you can say fancy, handy. Handy. Yeah, it's fancy, according to me. Seven. Seven by me. Okay. So you can add seven plus six plus seven plus Five. Again I'll give seven. Yep. Seven for me. I'll give five. That's right. That's right. The standards. What is available in the market off the shelf. We Five. So four point two? four. There I'll give it seven. That's right. For a T\_V\_ the most important feature which I

felt was the locator which is a cool feature. And then the scroll buttons are again cool features. We don't have L\_C\_D\_ for it but that we decided we don't want to have. Mm-hmm. Seven. Okay. Definitely seven. Okay. I'll say five. I'll say five. Why? No but it's really handy actually if you see. It's it's so handy. And then Anyb anybody who comes here anybody who comes to your home he'll at least ask once what is this. It's a very positive thing if you see like that. Youngsters. You want to flaunt. You with your girlfriend or something. Or might be it does some other kind of thing but Uh yeah, crazy. I say five. And you have saved it? You'll have to reload. They're not going to be as And they they might not be a as easy as this yeah. Yeah. S I go slightly up. Six. Six, five, four. Okay. I'll still give it five. Yeah. So it's somewhere three point five I think. No I said five. Mm-hmm. Oops. Yeah it's it's funny. Yeah, sure. Mm-hmm. Solar cells, yeah yeah yeah yeah yeah, we said no to that. I think rechargeable batteries will take care of the power thing. Yeah. To bring the cost Yeah. Yeah. Okay. So we have the regular chip on the print, which is one. And that's it. And we have sample speaker. Yeah. Yeah. the cost of that is very high. Uh-huh. Mm-hmm. Mm-hmm. And we have sev Yeah. So we we'll put some extras, if there is something. Okay. To reduce the cost, it's okay. Oh it's got all the directions so don't worry. It's got a direction. Okay. Okay. Yeah. That's right. We don't have any push buttons. No that is a scroll wheel itself, it'll be put in that. Ah okay, okay. Okay, okay. Yeah. No. There's no chip there. It just emits the signal. And the receiver accepts it and that's it. Just se sends the signal, that's it. Yep. No. Yeah. So first thing which we should take care of is, instead of rubber, let it be plastic. And uh that much money will be required for the base station, which is not there. Yeah. That's right. So might be ninety centimes for the the remaining things which the cord and everything which'll go That's right. Yeah. S Detachable battery. They like that. Mm-hmm. Biased. Mm-hmm. Mm-hmm. Yeah. The cost of the thing can be made more than might be. Because I think it's just the optimal, what we have done for the cost which we are looking forward to. Interface. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. That's right. Yeah. Integrate. Mm-hmm. So What else? Okay. Home? Happily satisfied. Mm-hmm. Thank you. What this button for? Okay. But if you want to go to page seven hundred? How man I don't understand it. Can you repeat it? Yeah. Ah okay okay. Okay. Okay okay. Okay. I see. I see. Okay. Okay. Is it really weight? Is it light or Okay. Okay. Ok Okay. Yeah yeah yeah, I see. I under I understand. How long the how long the bit the batteries long. I I yeah. I like I like it. Maybe the the thing that convince me the less

is the the multifunctional buttons. Looks a bit Looks a bit puzzled uh I dunno how to say that. You the the b the buttons change h h their function depending if y it's teletext or not And the volume button will will become And what about people who want to use digits? Butto real buttons? Okay. Because have you thought about configuration and all this kind of uh stuff? It's all automatic. Okay. Okay yeah it's fine. W we are living in a wonderful world. Automatically configure. Yeah. S Yeah. Yeah. Okay. I I const I constructed a a list of criteria based on the on the general user requirements. And each criteria is will be evaluated it's uh logical criteria so we must users must say i if it's true or is or if it's false in a in a scale ranging from zero to seven. Because i I'm sorry. Sorry. Ah yeah. It's from sorry, it's from one to seven. It's from from one to seven sorry. Because it should be an even it should be an even uh scale, and five is too short and nine is too long. I'm a I I'm Sorry? Yeah yeah. The variance is mi it's is minimal. I'm um answering your question. Okay. And that's the criteria I I found more useful

. I think I sh I I could write the criteria in the on the whiteboard? And we all four could range could evaluate the Okay let's let's evaluate if it's fancy or Seven but I would say seven. It's quite fancy. Six. Six. I would say Everything ar Mm everything It's compared to the all remote controls. Actually I don't know what are the r the real specification of a of a universal remote contro Ah it's not an univer but it's for all kind of T\_V\_s? Yeah. Four. Four. So four? It means cool features, like new features actually. I would say five. You said seven? Five. Sorry, I have them Of cour Of course the most difficult question for the end. I find it quite cheap actually. I dunno. If i i it depends, if you live in in Switzerland or you live in I don't know. Wha the initial specifications were for the whole all Europe or Yeah this is the the initial specifications. I would say six. It's quite cheap actually. Actually maybe Yeah I change the question. So yeah upload the Yeah it's two different situations. If you really need an universal remote control or if you would change your remote control for a n for a new one. So? What now? What range? Six. Six? Six? Six, so it's uh five point five, or less. Actually yeah, I we Five? You are romantic, really. I would say two. Who is the outlier? Wh wh you said five? I don't know if it's a No because there are more yeah, we shouldn't sum like that. Because the the last two questions is much more important than the rest actually. Otherwise we wouldn't we will not sell. Uh no I didn't anything. Yeah, the uh Yeah. Do you want me to sum o I think it's not S Actually what's the differen Too expensive. Actually whe whe when you wrote regular chip you should put two, because there is another chip here. Yeah but you need Fo i it does nothing actually? Okay so now we have a product which nobody would would buy. Would yeah, would buy. Yeah because th th the evaluation project Ah would buy, yeah. Massively, yeah. Yeah. Okay. Uh you have been in Milan a couple of times, so. And you said the lowest. Yeah, for the batteries Mm-hmm. So more general remote control instead of just focusing on uh on T\_V\_. The complexity shouldn't be much higher. For you said if it good for D\_V\_D\_ then I would Bye. Okay. Good afternoon again. So we should have our final meeting about the detail designed of detail design of the product of the remote control. Um So here is the agenda for today. Uh uh just going to go quickly through the minutes of the last last uh meeting then we have a p presentation of prototype of you two, sounds interesting. And we'll have um presentation of evaluation crit criteria by ou our Marketing Experts. Then we'll have to go through finance evaluation of the of the cost of the thing and um hopefully uh we should fit the target o tw of twelve point five uh uh Euro. Okay. So let's go. Uh if I go quickly through the minutes of the last meeting. So we went through th uh w we took this following decisions. No L\_C\_D\_, no speech recognition technology, okay, we went through a b to a banana look and feel for the remote control. We went through the use of wheels and but buttons. And also the use of a basis station for battery ch charging and uh also to um call the to call the mot mote remote control when it is lost. Okay. Um. Good. So guys let this uh wonderful thing. Oh yeah. Sorry. Um. Which is Yeah can you show it to

the the camera maybe. Mm-hmm. What's the use uh of the t turbo button already? Ah yeah yeah and then you stop when you stop it stops. Uh-huh. Which one? Okay. To navigate it through th through teletext. with the wheel it's easy. Excellent. Calling. Excellent. And the the leaves plays the roles of of antennas? Oh. Great. So, what else? Yeah, they're light. Ah yeah. So for the power source, apparently you still you you want to use both solar cells and batteries. Uh you mean okay. So Yeah, where are going to where are you are you going to place them? You have enough surface? You Okay. What will be the

autonomy? Roughly? The autonomy. Autonomy. Uh I mean how long does i how how long can it be held off a station? Yeah. A long Yeah, so it's It's used only when you Yeah. F weeks. Right. Next slide? Okay. Okay. Those really sounds very good. Nothing else to add? Yeah. Well in fact b both will be could be useful, navigating through teletext. Yeah. Wow. Very good uh yeah you th yeah. Bananas everywhere. Okay, so So we have to go through now evaluations. So your slides are ready? Uh you're four I think. So this is one, which one is this one? Num number So to have in order to have enough granularity it's in order to have enough granularity in the evaluation. Okay. Okay. Yeah, six. S seven. Six. No, wait. What do you say seven? Five? Okay, six point five. Handy? Seven. So seven, seven, six, six point five. Functional. Four. Uh for a remote control, does he have all the you could expect. Yeah. So it's universal but for T\_V\_s. So s uh four? Five? Four. Four. Okay cool? Cool device. Yeah. Seven. Six. Plus six, I say I said seven. So it's six. Yeah. Seven. Seven. And you? Outl you are not lik outlier. Seven Okay okay okay okay. Of course I'll buy the banana. Well Twenty five Euros. Cheap. Yeah, so the target price is for all Europe, or only for rich countries? It's more targeting U\_K\_ or So this is selling costs, not production costs. Yeah yeah sure. Um Five. Aw, should be nice in your It's kitsch. Well, don't forget well, don't for don't forget who we're targeting also who are f f who are wh yeah, youngst youngst No well yeah I if you would be young. Not telling that you are young. Li li like a teenager for instance. Okay you're you're crazy teenager and you like fun things. Yeah. Yeah, you want to show the beautiful banana you have. Okay so you s you give oh yeah yeah I know I know. So you say two. F I d I say five. You say? So what's the new question? Uh yeah, I think so. Yeah that's two different question. Ugly. I stick to five. W we have six, five Three So we are six, five, four Yeah. So So and last question, will I change my rem change my remote control from Mando banana. Um, zero. No uh we can't. So one. Well if. No uh let's say I'll put two. It's for the T\_V\_. Two three five two three fi and two. So it's r Yeah, three point five. No no you say five, he is the outlier. Okay just just do a sum. Well maybe we should we should uh have a look globally glob Yeah. So maybe maybe w we can we should stick to general feeling. We can had uh have a out of these numbers, which which is that well we should go for it. Problem with connectors? Okay. So let's move uh let's move on. Okay, now now we have to mm to estimate uh the cost okay. So I prepare an Excel sh uh an Excel sheet. Um well we are going to calculate the production costs. We should we should be below twelve point five. So I already uh put some pu some numbers here, okay. We are going to go through so this is the number the mm number of components we need for this thing. So it appears that there were things that we didn't thought about. Uh and also things that I uh I d I forget to uh to put like solar cells. Oh yeah finally we say no. Okay so let's let's go let's go let go through all the lines. So hand dynamo. This something we didn't thought about. But Yeah. Yeah. Okay so we we stick to battery, one. No kinetic also. I don't I don't see the difference between kinetic and dynamo. Ah you have to ah okay I see so kinetic is really uh shaking the banana. Crazy. Okay. So those banana is falling. Let's go ahead. So we we st only have one for battery. Uh then for electronics um so I didn't put anything for the. Yeah. Yeah. Okay. No so we hin Yeah so one. Ooh ye ye ye the cost is increasing. So we are The beep. That's what Okay so I'll remove

it. S So don't we need a Oh there is no listing for r radio frequency thing. So Yeah maybe. We'll see later. Okay so in for the case um I put single curved. Because we have two things. No. Well. What a what i if I put one here. Yeah so let's put

one here in the then instead of single oka all right. So we stick to plastic, it cost nothing. No, it's too no. It's too expensive. We're already at eleven. Okay so I put rubber one. Okay so special colour, yellow. Uh for the interface we have We have three. No no. We have two scroll, and we have three push buttons. And No it's no chip. This is just radio frequency. Th This is no chip. It's just Yeah. No. Just only. Okay w we didn't think a thought about uh integrated scroll wheel push buttons. Yeah, so Yeah. Okay. So no L\_C\_D\_, so for we have no button supplements, right? Uh well in fact could we could not we consider this button as a button supplement because oh no, these are these are for colours, co and special forms, special colours and special materials. So Okay so we are over budget. Yeah. Yeah. So mayb in fact n we have to put two here because it cost nothing. Exactly exactly so we have margin for that stuff. Yeah maybe. Okay good. Wha Excellent. Um we'll invest in R\_ and D\_. Yeah. So well we're under the the the cost. So we can go to through to project evaluation. Sorry? Which is different. Which is different. None of us will buy it. This is a battery. This is what we which you can mm It did yeah. Extra battery, yeah. Exac Well in fact I I did not know I didn't know really what to say here. If uh if you have any ideas of what we can we can say. So I don't I don't I don't understand what what they mean by satisfaction um and for and for example. Should it be more like um like a status of of the these meetings in fact. Yeah well in fact uh we we use a little bit the white board and the digital pen, not that much. Oh yeah it's really creative. Yeah. Yeah maybe we should go through, yeah an uh evaluation. So maybe you should we should do a kinda evaluation in the streets like asking to young peoples well, do you like to have a banana as a remote control. Yeah. Mm-hmm. Yep. Any any new ideas we could uh we could investigate next time? Dunno, oranges? Hmm. Okay. Very good. So Well done. I think we we can go home. Yeah. Maybe maybe we can hassle the the production department to to make a a real prototype that we can use at home to to evaluate. Okay so thanks very much. Bye.

---

# Meeting ID: 130

Data Source: Train

## Executive Summary

Um the agenda for this meeting is um we'll initially have the prototype presentation by our two designers . And then we will evaluate it , given the criteria that um that we gave gave it . And um talk about our finances , whether we were under or over our budget . It's a pretty simple design . It's um based on a mango ? And we have the company logo here where's the L\_E\_D\_ ? It's in the middle of one of the little R\_s . And then the other one is the power . So it's palm-held . buttons are accessible from your thumb . And this is just if you've got like eleven or twelve or thirt the plus . So one plus one would be eleven , You press a plus button ? I've never heard of that kind before . but if if I wanna go to say number like sixty five , channel sixty five , if I press the six it'll go to channel six , and then I'll press the plus , and then it'll go to six and then put the five and it'll go to sixty five ? we can further define that . I wouldn't have thought it'd be a problem that it went to channel six first , in like on the way to channel sixty five . like as long as we realise that's what it'll do . Well the there is a there's a delay on remotes I think . um we went for like a a circular design for the numbers because we thought that's kind of a more natural movement than just going like that with your thumb . And it might actually help with the repetitive stress injury as well . Um and the feel of it , I mean , we've made this out of Play Doh , which is representing the , you know , the rubber , and the spongy rubberness . Okay , as for the colours , we were presented with um a limited range of colours for this prototype . that this is not necessarily a representation of the true colours that we would necessarily use . Um and we're thinking to carry-on with the fruit and vegetable theme , the colour um combination just could just be named after different fruit , But we're thinking that , seeing as we're having it in interchangeable casing anyway , like banana could be black and yellow , watermelon red and green , Banana's more representative of our colour scheme , like the company the yellow and black . or vanilla might be the most popular if it just uh blends in we thought of the components it was definitely um a focus of ergonomics and just a single ha handheld device , And so now that we've we have a prototype , uh we need to go over the finances Do you need to do a presentation first ? Evaluation criteria is next in line . Um , we're gonna be doing an evaluation report together based on the prototype that we've just seen . Um and looking looking back at my notes from our both our conceptual and our functional meetings , um I made a list of what our original requirements and goals were , Um and we're gonna do it on a one to seven scale where one is true and seven is false . So basically the lower p the lower the points the better . Do we have a fancy look-and-feel ? We've been quite

successful with the rubber coating The look is a little bit more playful . Yeah I guess that depends on your definition of fancy , I mean th the colours we were given for making the prototype aren't the colours that I think we would've necessarily chosen . I mean diff if you can visualise this in nice colours I think it would look quite fancy . I kinda like the potato look . It's a two ? Okay so question number two was is it technologically innovative ? So I know we have the kinetic energy which is very innovative . and the use of the rubber . and we don't have any scroll buttons , it's all pushbuttons , there's no L\_C\_D\_ control , so if we're thinking about the rest of the market , it's sort of probably halfway . we didn't want it to be any more innovative than this , because then that would've defeated the purpose . we'll put three , but I think we actually reached our goal . Uh , will it be easy to use ? Yeah . One . you can't really get confused with that . The plus number thing . But once that's figured out , it should be fine . Is this a good-looking remote ? Again I think the colour comes into this . I think that the logo could be smaller . Remember the management said that it had to be prominent . I like the appeal of it being like a big glob in your hand . where's it gonna sit in your living room ? the bottom could be like ch chopped a bit . But then it wouldn't sit as comfortably in your hand . Would we wanna show it off to our friends ? Okay , so should we say two for that ? will people be willing to spend twenty five Euros on this product ? I think we have to market it in the right way , that um to say that it is simplistic . And the kinetic energy part . No , I guess , I don't know much about the remote control industry , how much your average sells for , About ten pounds . But you don't have to buy batteries . So in the long term this can actually save you money . I would give it a two still though . Does this prototype match the operating behaviour of the average user . I think it does very well . easy to use . Okay so one ? Will this remote control be easy to find when lost ? is the alarm system still was it implemented ? But I mean it's not obviously obvious from the outside that that's gonna happen 'cause you can't s particularly see an alarm . I thought the light from the inside was gonna light up . You press the button it makes a noise It would just be a little speaker on the back or something . We can give it a one , because compared to every other remote ever m ever made , this one will be easier to find . Will it be easy to learn how to use this remote when brand new ? it's eas they'll pick it up and they'll know what to do . The plus thing needs to be worked on . we'll say yes it's uh one ? Uh , will it minimise the effects of R\_S\_I\_ , I think so . We may have to do some more research into other strain injuries that we don't know about . Two okay . Did we somehow incorporate the company colour and logo ? Well , yeah the colours are yellow and grey . So it could be grey on the banana one . I think this is the Four I think . Um , did we stay true to our motto and put the fashion into electronics ? But maybe more like two Alright so based on this evaluation , do we average them out sorta thing ? Yeah it is one point nine . So we need to tally up how much our w our product will be costing . Um we're using a regular chip . Um , it's cur it's double curved , so its curved all around . Um , we're using plastic and rubber , So it's like special colour well we'll have two colours Well one colour for the case , one colour for the buttons . So um our operating cost is twelve twenty Euros . I mean we weren't really given a lot of time , or materials , yeah , to go about our design task . Like we were very creative in in coming up with an idea I guess , but m and like if we had decided to use the L\_C\_D\_ screen , and like solar power backup and everything , then we wouldn't have been able to afford that . Good leadership , I think we stayed on task . and also our personal coach helped us along the way , We never were pushed for time , or sat around doing nothing , so I think we worked great as a team . We needed more Play Doh colours . The computer programmes are good .

Yeah well I guess we really it we bounced off of each other , Fantastic . Thank you very much .

## Complete Meeting Transcript

I'm sorry. What was the where's the L\_E\_D\_? Oh. Okay. Oh, there's no e okay. Okay. Sixty. Well the there is a there's a delay on remotes I think. Where you can have it it's like a five second input time. So as long as you hit them dada it should be fine. As long as there's not a big pause between the t hitting the two buttons. Was there so on the top there is volume and Channel up volume up. Okay cool. Yeah. It's the R\_. Mm-hmm. Mm-hmm. Yes. Oh it's nice. Oh I think I killed the five. I did. I killed the four. Oh god. Oh it smells good. Bravo You want the I don't know what order it goes in. I have one. Evaluation cri Okay. That's me. Hello. Oh there we go. Okay. Come on my computer. Come on. Sorry my computer's giving me technical difficulties. Should I press it again? Last time I did that it sh Okay. You're right. Oh. Still not there. Okay now I think for this one I could Would you guys prefer use the whiteboard or mayb maybe I'll just do it on right on the screen where you can see it. Um, we're gonna be doing an evaluation report together based on the prototype that we've just seen. Um and looking looking back at my notes from our both our conceptual and our functional meetings, um I made a list of what our original requirements and goals were, um, back to our kick-off meeting this morning. Um, and we'll evaluate as to whether we've s done what we set out to do. Um and we're gonna do it on a one to seven scale where one is true and seven is false. So basically the lower p the lower the points the better. Okay so question number one. Does the remote whoops. Sorry. Oh I'm not gonna be able um, I'll do it on the whiteboard. I can't change it so I'm g I'm gonna ask you to push it down once. I'll write down our scores up on the Okay so number one. Do we have a fancy look-and-feel? Yeah I guess that depends on your definition of fancy, but it's definitely different. It's not your traditional yeah. Mm-hmm. Yeah. Mm-hmm. Yeah. I kinda I like the potato look. It's very different. It's what? Oh sorry the mango the mango look. Yeah it is, fruit or vegetable depends on your mood. So I myself would say a one or a two. It's a two? Okay, and p One being true. So Two. Okay, actu that's pro that's gonna get confusing, like that. Okay so question number two was is it techn technologically innovative? So I know we have the kinetic energy which is very innovative. Use of the rubber, the use of the L\_E\_D\_. Isn't Mm-hmm. Yeah. And I think I mean it it's tough to say because we were we didn't want it to be any more innovative than this, because then that would've defeated the purpose. So I mean I we'll put three, but I think we actually reached our goal. We didn't want it any more than that. Okay question number three. Uh, will it be easy to use? Yeah. Yeah. S Yeah I think it's you can't really get confused with that. I mean, there'll be s we have to work out the uh number the plus system. But once that's figured out, it should be fine. Number four. Is this a good-looking remote? Remember that seventy five percent of users find most remote controls ugly. Mm-hmm. Whoops. Should just not touch it. This time it's the three I killed. I was just wondering if it should be like flatter. Or Well Yeah the bottom could be like ch chopped a bit. Oh. That's true. Maybe, it could it could be on the bottom, so you wouldn't loo like if it's flat here, so it sits up. Like that. I g If it's weighted maybe. Details, details. Okay. So, is this a good-looking remote? Would we wanna show it off to our friends? Yeah. Yeah? I mean I gue yeah, it's personal taste, but Yeah. Okay, so should we say two for that? Yeah? Okay. Uh, question number five. What's um will people be willing to spend twenty five Euros on this product? Remember that eighty percent of users were willing to spend more money when a remote control looked fancy. Mm-hmm.

Yeah it the marketing will have a lot to do with it. Shake it and the buttons fall off. No, I guess, I don't know much about the remote

control industry, how much your average sells for, but I know I am, aren't I? But you don't have to buy batteries. So in the long term this can actually save you money. So we'll market it that way too. So yeah I think with a good marketing scheme um and the personalisation options, it'll Yeah. Okay number six. Can someone read it out? Or Um yeah. So that was mainly that the statistics we said Mm-hmm. Yeah I guess the I think the key word there is average, 'cause there were some people that used the uh video input and sound and stuff. But they're not you and I really. So. Okay so one? Okay. Number seven. C Heather could you push it down? Will this remote control be easy to find when lost? Remember that fifty percent of users lose their remote regularly. Now is there the is the alarm system still was it implemented? It turns into a duck and starts quacking. Here I am. Um Okay. We oh you're just explaining why it's not on the prototype. But yeah, it'll be there. So we can we could say that We can give it a one, because compared to every other remote ever m ever made, this one will be easier to find. Okay. Um Question number eight. Will it be easy to learn how to use this remote when brand new? Remember that thirty four percent of users usually found it difficult. So it has to be yeah, it's eas they'll pick it up and they'll know what to do. The plus thing needs to be worked on. Yeah. Well Do Does it make more sense for the middle one to be an just an enter button? So then you would have to push two buttons every time at least. You could just press six enter, or one two enter. Yeah. Um, okay so we can we'll say yes it's uh one? Okay. Question number nine. Uh, will it minimise the effects of R\_S\_I\_, which was repeated strain injury? Um, which affected over a quarter of users. S It's soft, and And people could Mm-hmm. I don't know what other options there are. Could I mean, you could hold it in your left hand and d use your index finger. But there's not really any other options unless it's like a keyboard. So, I think we did as as much as you can with a remote control. So, one or two do you think? Two okay. Okay number ten. Did we somehow incorporate the company colour and logo? Now is the colour gonna be there even if it's like vanilla? Is the yellow Mm-hmm. It sounds like the colour's something that we But I mean the yell yeah d yellow's ugly though, depending on the So I think we'll have to talk to our executive managers, and see if we can get away with just the R\_R\_. Okay. Yeah. And the buttons in the middle. Okay. So, do you think that's more of a three then? Three, four? Four? Well we have good reasons for it, so we but we can still put a a four? Okay, and final question. Um, did we stay true to our motto and put the fashion into electronics? Current trends of fruits and veggies, desire for sponginess. Yeah. No, uh, are the plates interchangeable? I think I missed a few they are? So you can have banana and kiwi and okay. Okay, so that's something that's kind of in the making too, like maybe it'll become more Mm-hmm. Yes we do. So I wh what was I gonna put for that? A two for fashion? Okay, so our average there, five, six, eight, ten, eleven, twelve, thirteen, fifteen, nineteen, twenty one, divided by eleven is Between okay. Um. Yeah, that's very good 'cause the highest we coulda got is one. Does that seem right then? Okay. Sorry. Are you gonna do that? Okay. Oh is it locked 'cause I'm in it? Or okay. Mm. 'S good. Mm-hmm. Yeah and the conceptual and functional. Like we were very creative in in coming up with an idea I guess, but m When we can down to it. Okay. Mm-hmm. Yeah. Good leadership, I think we stayed on task. Mm-hmm. And the timing was good. We never were pushed for time, or sat around doing nothing, so Was good teamwork. I think we are well-suited to our roles. Oh really? Okay. Yeah. The computer programmes are good. The Yeah. I don't think there was anything Yeah. They'll probably still be there. Um I'm not sure, new

ideas found. Yeah well I guess we really it we bounced off of each other, which was cool. Like based on marketing stuff and then you'd say something about interface and yeah, worked well. Mm-hmm. Oh

does it have smart materials by the way? Does it have smart materials? Oh yeah. Mm-hmm. Mm-hmm. By watching T\_V\_? Mm. Conclusion? Dadada. Okay. Here we go. Alright, the agenda for thi oh. Alright. Um the agenda for this meeting is um we'll initially have the prototype presentation by our two designers. And then we will evaluate it, given the criteria that um that we gave gave it. And um talk about our finances, whether we were under or over our budget. I have a um a spreadsheet where we can calculate um our prices for every aspect of of what we've made, given our options. And um evaluate the product, as a group. And um So first we'll have the prototype presentation. Do you need the um PowerPoint for this? Alright. On? A mango. Okay. Oh. Okay. Oops. Yeah. Notice you have a number ten button. Okay. No problem. Ah. Oh. You press a plus button? Oh okay. I've never heard of that kind before. Yeah. Yeah. Oh. I But Would you have to go zero plus one if you wanted to go to channel one or two? Yeah but I mean if you press, it'll go to that channel right away. 'Cause you gotta press the plus afterwards. Yeah I know, but if if I wanna go to say number like sixty five, channel sixty five, if I press the six it'll go to channel six, and then I'll press the plus, and then it'll go to six and then put the five and it'll go to sixty five? I th Um Yeah it wouldn't be a problem. But I was just wondering like as long as we realise that's what it'll do. Yeah. C\_ and V\_. Right, where um where's the power button? Oh okay. Yeah. Yeah. Oh okay. Yeah. Ergonomic, definitely ergonomic. The spon yeah. Yeah. Bit of a stress ball feel. Yes. I would. My goodness. There you go. Genevieve? Yeah. And something hmm. Oh right. Yeah. It looks more Think like vanilla and banana would. Okay yeah. Kinda Christmas, you know. Yeah. Cool. Alright, thank you very much. Good work everyone. Alright. And so now that we've we have a prototype, uh we need to go over the finances and seeing if this prototype matches uh what our budget can handle. So, I have something I'm going to Oh wait a minute. Do you need to do a presentation first? Yeah. I'm gonna check that out for a second. What time is it anyw Oh yeah sorry you're right. Evaluation criteria is next in line. Yeah. Just press um function eight again. And then again I think. One more time. Yeah. Yeah. Okay. Ooh. Yeah. The look is a little bit more playful. Oh definitely different yeah. Oh you were only given red and black? Oh okay. Yeah. Okay. Yeah. Yeah. It's mango. It's mango. Yeah. I would say two. Personally. Yeah. Yeah. Yeah. Yeah. Yeah. I'd say maybe three. Yeah we want it simple. Yeah. I think so. Yeah. Yeah. One. Th The plus number thing. Yeah colour will definitely be a factor. I think that the logo could be smaller. And maybe not such a prominent way. Maybe like at the bottom, kind of. Oh it just had to be on there I guess. I like the appeal of it being like a big glob in your hand. Maybe if the bottom was just sort of flat, and then the rest is like round. It would still be comfortable I think. We c we could handle it I think. Ah it'd fall over all the time though. It'd be annoying. 'Kay we're done designing. Come on. I think, it was another colour and it was like I think it'd look okay. I think maybe a two. Sure. Yeah. Yeah. Durable. But you're our Marketing Expert. Oh. Exactly. Exactly. Yeah. I would give it a two still though. Mm. Oh yeah. Yeah. Yeah. Yeah. We have the alarm system. I thought the light from the inside was gonna light up. Or or was it gonna make a noise? You press the button it makes a noise right? Yeah. Awesome. Awesome. I though w it was gonna make a noise. Okay. Oh okay. Whoo. Okay. Yeah, totally. No problem, mm. Totally. Yeah. Yeah, so it's just like channel six, six, enter. Yeah but you don'

t have to press zeros. And then like twelve, enter. Yeah. Yeah. I think so. It's like right in the Your thumb might get a little bit uh Yeah. But it is soft. And that's kind of what the um the PowerPoint slide thing said would be good for R\_S\_I\_, so maybe it is but Yeah. Yeah. Yeah. Yeah. Yes we did. Well, yeah the colours are yellow and grey. So it could be grey on the banana one. Yeah. Mm, yeah. Hum. I would say so. But maybe more like two 'cause there's no like pictures of fruit, it's just sort of naming it by a fruit. With the with the colours. Yeah. Yeah. That's fashionable in itself to have interchangeable plates. Be

like Yeah. Maybe if it was scented. Yeah we have money for that. Um Alright so based on this evaluation, do we average them out sorta thing? Oh. I would say two. One point nine or something? I don't know these things. Um, between one and two. Alright. Yeah. I'm attempting to do that right now. Yeah it is one point nine. Ooh. Go Heather Pauls. Yeah. Alright, now with that over and done with, our next step is to see if we are under budget. And um my computer's frozen. And now it's not. Okay. So um in our shared folder, if everyone could go there right now, um I'm going to um steal a cable. Um it's it's um it's an Excel file. Oh. Yeah. 'Kay there we go. Um, production costs. And um I have to access that as well. One moment. 'Kay so far I've added what I think or what is going on? Great. It's blinking at me. It's locked for editing. Read only. I'm gonna open up a second one then 'cause it's locked for editing. I have the original in my um my email account. I dunno. No. No, I was hoping that you guys could. Um, there we go. Okay here we go. So we need to tally up how much our w our product will be costing. So um if you can look up at the screen, um the large screen, oh I guess looking at your own too and telling me which one you think. Okay we're using kinetic which is quite a large expense at three Euros. Um we're using a regular chip. Um, it's cur it's double curved, so its curved all around. That's another three. We're already at five. Um, we're using plastic and rubber, so Good thing plastic is free, we're at eight. Um S Yeah. I guess we should do it just for one kind. So it's like special colour well we'll have two colours right? Well one colour for the case, one colour for the buttons. So we can Um, we have push button interface, so that's inexpensive. And um we have a special colour for the button, and we also have a special form. And a special material. Which puts us just barely under budget. Hurray. Yeah. Good work guys. So um our operating cost is twelve twenty Euros. Awesome. And back to our PowerPoint. So we've 'Kay. Yes we are. So we need to do a product evaluation, again, which is probably um I dunno. A different extension of a Hmm. Yeah 'cause we're talking about leadership, teamwork. Yeah. Alright so um Do you guys feel like there was room for creativity? Pushed for creativity? Ye Okay. So it'd be like need more time and materials. But you were allowed m creativity? I think so as like but you were supposed to have creativ Right. Right Okay Great. Leadership? Is this me being like, guys do you like me? Um. Yeah. Yeah. Oop Okay. Teamwork? I think we worked great as a team. Yeah? Alright how were our means? We needed more Play Doh colours. Yeah. But ever everything else was satisfactory? Is that good Yeah? New ideas found. I don't really know what that means. Hmm? Yeah. Yeah. Yeah. Each other's Mm. Okay? Well with that achieved, our last slide is our closing slide. Yes our costs are within budget. It's evaluated generally positively. And um don't forget to complete final questionnaire and meeting summary. Then we celebrate in such a way that I have no idea. Alright? Okay, bye. Okay. Um yeah. I just got a few slides, so show them. Thank you. Do you want to present it? Yeah, here we are. Mango shape. The L\_E\_D\_. So it's palm-held. Yeah. You just need the nought. So one plus one would be eleven, or Yeah

because if you on your average um remote, if you press one twice you just go to um or uh say you wanted channel twelve, you press one, and then you go to channel one, and then two then you'd just go to channel two, instead of twelve. So if you did like one plus two you could go to channel twelve, or two plus two is channel twenty two. Oh. Well I don't mind, we can further define that. I wouldn't have thought it'd be a problem that it went to channel six first, in like on the way to channel sixty five. But I suppose it's not as snappy. Yeah. Yeah. If you don't put it Yeah. Yeah, that yeah. Mm-hmm. Um And channel, which is so you could just go like that without thinking about it, like It's the bigger R\_. So it's just like. We deci Yeah um we went for like a a circular design for the numbers because we thought that's kind of a more natural movement than just going like that with your thumb. Uh e ergonomics are all considered. Yeah. It could cause another type of repetitive stress injury though. But yeah, no I mean

it's a different movement so yeah. Um and the feel of it, I mean, we've made this out of Play Doh, which is representing the, you know, the rubber, and the spongy rubberness. Um 'cause it was said before in the material specification that this the this anti-R\_S\_I\_ um material is often used in stress balls so this has got a you know a bit of give to it, and it just feels feels different. Would you like to feel it yourselves? How it fits in the palm of your hand? Thanks. And you? O Okay, as for the colours, we were presented with um a limited range of colours for this prototype. But we're thinking that, seeing as we're having it in interchangeable casing anyway, that this is not necessarily a representation of the true colours that we would necessarily use. Or the combination. Um and we're thinking to carry-on with the fruit and vegetable theme, the colour um combination just could just be named after different fruit, like banana could be black and yellow, watermelon red and green, or vanilla might be the most popular if it just uh blends in more settled cream instead of the others are all a bit garish. Banana's more representative of our colour scheme, like the company the yellow and black. So that for corporate identity that would probably be the most strength. I mean watermelon, you know, m probably appealing to the yeah, seasonal. Apple green, brown, more kinda trendy, you know, khaki Yeah. Okay. Um yeah we thought of the components it was definitely um a focus of ergonomics and just a single ha handheld device, I mean you don't need to use both hands, one hand to hold this and type in with the other, you can just use your thumb. Um, as we said the rubber's probably used for comfort and anti-R\_S\_I\_ and that's about it. Mm-hmm. Mm go Feel I think. We've been quite successful with the rubber coating and Yeah. I think the colour has a lot to do with it. I mean th the colours we were given for making the prototype aren't the colours that I think we would've necessarily chosen. It's not the kind of ooh uh at all sleek red, black and yellow, and orange. Um But if you can imagine that in like a s just a maybe uh a kind of pale metallic-y finish or something Well I know know it's for rubber. I mean diff if you can visualise this in nice colours I think it would look quite fancy. Oh well, potato, mango, fruit and veg. Potato's fine. Potato's fine. Yeah. Totally. It's really adaptable. For the fancy I uh two, three. Yeah and the use of the rubber. For the anti-R\_S\_I\_. The L\_E\_D\_ use isn't particularly innovative and we don't have any scroll buttons, it's all pushbuttons, there's no L\_C\_D\_ control, so if we're thinking about the rest of the market, it's sort of probably halfway. In some aspects it is, like we said. Yeah. Though it was our specification. Yeah. Yeah. Yeah. Yeah and perhaps the turning on but Mm. Again I think the colour comes into this. Okay. Not in Don't worry. I suppose I've got quite big hands. Thing is like t

hat, it's not going anywhere particularly. Yeah. Uh yeah, it's less um, what's th ha. H it's got higher centre of gravity like that. I would definitely go for that rather than like your average plain old remote like that, but definitely in another colour, I'm not happy with those colours. Yeah. Yeah. Yeah. And the kinetic energy, shaker-style-y, whoo, ooh no. But you know, those'll be firmly on. Mm, yeah, that's true. Yeah. Good point. Yeah. Yeah. Does this prototype match the operating behaviour of the average user. Yeah. Because yeah, because the most accessible buttons are the volume and the and the channel-changing. And it's just you won't have to think about it. You don't have to look down to find them. They're clearly there, easy to use. Simple. Yeah. Mm. Yeah. It Yeah I lights on and, or flash as well. But I mean it's not obviously obvious from the outside that that's gonna happen 'cause you can't s particularly see an alarm. Yeah. But when the alarm's not yeah. If you Yeah. You could s Yeah. Well the thing is, if it was had an alarm system, I mean, when it when it lights up as we I mean it could light up when the alarm went. But if it was hidden underneath the cushion or something, there wouldn't be any point. So you can't see the alarm, but it would light up. Yeah. Alarm, but you can't see an alarm inside uh the alarm system itself. Yeah. Yeah. It w yeah. Sorry. Yeah. Sorry Heather. That wasn't very clear. Yeah I think just because it's we've decided to reduce it down to the basic buttons, I think that in

itself makes it so much easier to use. Mm. And or sixty six enter, y Yeah I think that's probably more straightforward. Yeah. Good Ooh. Mm. Oh. Injury. Yeah, that's what I was thinking. We may have to do some more research into other strain injuries that we don't know about. Mm-hmm. Mm. Yeah. I think we're getting that's true. Mm. I think yeah, I think too. Yeah. Mm. Yeah. I think this is the the factor that we've been least successful in confronting. Yeah. Four I think. Well I don't what do what Okay. Yeah. Like um the colour scheme names and stuff. Yeah. Yeah. Yeah. It is. The thing is, I think if somebody saw that and you said what was that inspired from, I don't know if you'd instantly say mango. Oh yeah. There we go. That would be great. Um Okay. It's Between one and two. So that's pretty fantastic. Mm. It seems like it should be more around two. Do we have an online calculator? Okay. Oh wow. Well done. Well that's excellent. Production costs. It says it I think it just means that we can't add any more to it now. Have you have you completed it? Oh right. Okay. Okay. Yeah. Yeah. Yeah. Double double-curved yeah. Yeah. Yeah. Yeah. Mm-hmm. Oof. Congratulations guys. Of the actual project rather than the product? A project? Is is yeah. So wh how we actually went round uh about doing it. I think we were pushed. I mean we weren't really given a lot of time, or materials, yeah, to go about our design task. So I think we could've done with a bit more time. Yeah. Yeah. Yeah. Well we were just limited by resources really and like if we had decided to use the L\_C\_D\_ screen, and like solar power backup and everything, then we wouldn't have been able to afford that. So that did limit creativity. Just resources. But yeah. The fruit and veg idea. Yeah we did. We've, uh seeing as we've come out with what we intended. A pro um a product within the budget. I think that's a sign of good leadership and also our personal coach helped us along the way, so you know I think it's been fine. Yeah. Good timing. And project manager of course. Yeah. Yeah. Um Yeah and more Play Doh, 'cause that was all the red we had. So even if we wanted to make a bigger prototype, we wouldn't have been able to. Yeah. It could be really straightforward for the computer. I think the only thing was having to remember to you know to tick the okays but I think I was the only one who struggled with that. Mm. Uh me too. Yeah. Well I think we've all learnt stuff fr

om each other, like the n um yeah. Just about each different. Got new ideas from each other. Yeah. Yeah. Sorry? Oh yeah. Well mm, did it come into the into I dunno if we counted that in the costs. Yes. Uh. Fantastic. Okay, brilliant. Thank you very much. Um This is what we came up with. It's a pretty simple design. It's um based on a mango? Yeah. And we Yeah. And we have the company logo here and this will be the infrared here and this'll be the power point, the on off button kind yeah. It's in the middle of one of the little R\_s. And then the other one is the power. And uh we just have a simple design. We wanted it all to be accessible from your thumb yeah palm-held and all the buttons are accessible from your thumb. So you don't have to Oh that was a mistake, wasn't it? Right no, that's a zero. Take that one off. Sorry. I was in charge of the numbers. And this is just if you've got like eleven or twelve or thirt the plus. You can go one, three or something. You press that first and then you go one three yeah. Well we just thought, we have all the numbers here, so we wanted something representative of numbers larger than ten and So the plus and then yeah. No no, th all that's why we have all these numbers. These numbers um these numbers all work independently up to nine. Yeah. Oh no. Uh, the plus is only for if you're going past the number nine. You p Oh. No you press the plus first. I I well it doesn't we haven't really s I would've thought you pressed the plus first and then the six five, but she says plus press which what do you think is simpler? It's a Yeah. Yeah. Oops. Yeah. Yeah. Yeah. So A channel. Just so we can flick It's in the middle of one of the little R\_s. Yeah, so it's all accessible. Without m taking your hand off the remote. And it might actually help with the repetitive stress injury as well. Okay. Yeah. Yeah. Yeah. Yeah. Of Play Doh yeah. 'Cause it'd be quite subtle and

Yeah. Yeah, yeah, yeah. The pomegranate's kinda girly and funky kind of, and then the vanilla's more for the more sophisticated customer who just wants something that fits in with all decor. Yeah. Mm. Well Yeah. Yeah. Yeah so not very sleek and we don't wanna go for black because most remote controls are black or grey. So we want it to be stand out that way, anyway. Yeah. A metallic-y finish we were thinking. Polished. Okay Yeah. We we were we were thinking about yeah. I w I'd say two I think. Fanciness. Yeah. Yeah. Mm. I'll go for three as well. No. Wouldn't be simple, yeah. Yeah. Yeah very. I think one for that. Yeah. No. Yeah that's the only thing yeah. It's definitely Yeah. But the Remember the management said that it it had to be prominent. Yeah. Yeah. But you know what I've just thought of there now. What where's it gonna sit in your living room? Is it not gonna fall off the arm of the sofa? Yeah. But then it wouldn't sit as comfortably in your hand. Yeah. Oh that would be nice. Yeah. Three. You would though, 'cause it's bit it's more interesting than other remotes. Yeah. Yeah. I think we have to market it in the right way, that um to say that it is simplistic. So people don't just see it and think, uh, this is so simplistic, I don't want to spend twenty five Euros. We have to market it. And the kinetic energy part. Yeah. Don't shake Oh no the plus. You're use the zero. Make a new one. I think they're about ten po ten pound, aren't they? About ten pounds. Fifteen? Yeah. Mm. Yeah. I think it does very well. The zap yeah. Uh Yeah. Yeah the bu when you press the alarm system, the lights behind the and it'll vibra It'll be again in the marketing. Yeah. The light it will. But But both Yeah. Oh, that would be brilliant. I'd be tempted to Yeah. It would have to be in the market Yeah but you still couldn't see it. It would just be a little speaker on the back or something. So the plu the plus w once that's written down on the page that'll be really simple, won't it? Yeah. That kind of annoys me though, when it's zero six when you have to press

I don't know why. Oh okay. Right. Alright, aye. Yeah. I'd say w yeah one. Yeah. Yeah. Hmm. But if you're zapping yeah. I don't think it will f Yeah, the biology. Mm. Yeah. Yeah. I I'd say t two. Yeah. Yeah. N We we can't really do that because for example on the banana theme we can't have it as being yellow. It won't stand out. So n it's not always gonna be the same colour. Gray, yeah. Yeah, could be grey. Yeah that's right, we didn't even rea Yeah. Perhaps a metallic or or like that's grey, and it wouldn't be that expensive to have a little bit of metal. No? That isn't rubber. Okay. Following that briefing we did. Yeah. Yeah. Yeah. Yeah. I think w yeah, I think one. Well that was our brief and we followed the brief. Well we haven't got a big banana but Oh yeah. No. No. Oh that would be class. Yeah. Two. It's Yeah. Close to two. Yeah. I got Yeah, 'cause we've a four to bring down. Uh, aye. Yeah. Uh, should've added five. This is. Yay. Is that the project document? Yeah. Oh right. What about a special colour? Are we using that? Yeah. And a special material. Yeah. That's good. Yeah. The ma Or materials. Yeah. Yeah. Yeah. Creativity. Yeah. Yeah. Yeah. Yeah. Yeah. Yeah, it c it might've been bigger. Yeah. I'm actually not sure if I've saved my presentations. Yeah. Through discussion. Yeah. And we were a able to modify each other's ideas to fit in with our areas of expertise. If if it if it If it can be afforded. Yeah. Yay. Yeah.

---

# Meeting ID: 91

Data Source: Train

## Executive Summary

The User Interface Designer and the Industrial Designer presented the prototype to the group and displayed all of its components. They demonstrated how the locator function operates. They suggested that a trigger button should be included in a later designing phase to improve the feel of the product. The Marketing Expert gave an evaluation of the product and felt that it satisfied his criteria. He suggested including a lifetime guarantee and expressed concern that the remote would only be used for televisions. The Project Manager discussed the final production cost with the group; after an analysis of all of the components the final cost was 15.8 Euros. The Project Manager then led a discussion about the group's experience on the project. The group felt that they worked well together and that they had room to be creative, but only after they changed many of the initial specifications. They also had difficulties using the meeting-room equipment. They were satisfied with the increased final cost and budget.

## Complete Meeting Transcript

Uh 'kay. So Yep. Okay so we're here to talk about the detailed design of the product, 'kay? And here's the agenda for this meeting. Uh I'm just gonna open, say a few boring words to start with again, and start taking minutes afterwards. You guys are gonna give us a presentation of our wonder product that I can see some demonstrations of over there. Looks cool. And then we're gonna evaluate it. Then we're gonna talk about finance, and I've got a lovely Excel spreadsheet that I knocked up in the last five minutes for this. And uh yep. And we're gonna evaluate the product and close. Got forty minutes to do this in. We should be fine. Let's try and keep this one on schedule. So Your thing is in where is it? Is it in Who wants it? Zapping your favourite channels, eh? Oh okay okay. Ah 'kay okay, that's favourites. Ah 'kay. I like the the the the logo on there as well. It is very prominent. So this is the Okay. Ah, okay I see. It's pretty cool. Is that could that be easy to for the scroll wheel to be rotated if it lands on it? Oh well I guess it depends on the stiffness a little of it. Mm. Feels good. I take it that this is gonna be slightly lighter in the final design as well. Yeah it's kinda cool. You have to reach a little bit don't you. Ah yeah that wouldn't make sense. It's cool. I'm impressed. And hold it so wh what's the marketing perspective? Okay. Mm it's impressive. So let me get it, if I press this button I see. That's pretty cool.

Hang on. I plan to do that as well. So the the two blue are are those for the the it to charge off of in? Ah okay okay. Yeah it's the right shape isn't it? But maybe if you had a trigger plus the scroll then that would get past the the problem of it landing and scrolling, 'cause then it would need to be hit on both sides. Okay. But it's definitely got options for like different types of models and things as well based on that, hasn't it? So is that the the final colour scheme as well or? Okay. The hmm. It came off. The scroll wheels, a problem with them not being sort of I don't think the user interface guy wants to touch it anymore. Mm. Okay enough of that. Well i it's cool guys. 'Kay so are we done with the this presentation? Okay. Now now. Have you? Okay. Can I not get your get at stuff from your shared folder now? Oh I see I see. Do you would you a argue that that we're better going for the higher cost than bringing it down into twenty f five as we probably could, but lowering our profit margins? Mm-hmm. Mm 'kay. And we're actually quite open to be able to expand the product for a later version with those features quite simply anyway, aren't we? Th there's no fundamentally different technology to do that. Hmm. Yeah, the plus there's the the risk of making it unusable as well, or making it less b because at the moment it's actually very straightforward to look at all the buttons, you know what they do, it's very simple, and it just works. Mm there's a risk of that. Okay so we can talk about finance now. So I have a little spreadsheet for us where I I was wondering, you when you talked about the fifteen point eight Euros, I was wondering how you came up with that figure? Okay so I have bit of a spreadsheet here for this. Now I've made a f few assumptions here in that I'm assuming that our power adaptor we can make for a cost of four Euros, equivalent to solar cells, which I think is probably fair considering that we have in-house manufacturing of power adaptors already. Uh and I'm assuming that the locator beacon, the you know the Can be made for it sounded different that time uh can be made for a similar price to uh an L\_C\_ display, uh an uh Uh do you think that's fair coming from a m the manufacturing?. Okay. Yep. Okay. So we're down to sixteen point four, yeah. Is that a single-curved rather than a double-curved? We're not entirely sure what single-curve versus double-cur You think? Okay I'm convinced. But we save one Euro that way, yeah? So we come bring it down to Fifteen point four. Well

hang on. Do don't speak so it's in here, in that w do we have any we have special form don't we? So that's yeah. But the the the we haven't talked about any special colour though uh I don't th if we're going for greys and silvers then I don't think we're O okay so we're Push-button, scroll wheel, we're basically we have uh th is this intended to be a button as well or just a scroll? Just a scroll? It's not one of the scrolls where, for example, with this one you could push it down to be a button? Okay then we have fifteen point eight Euros. It wasn't bad. Okay so we're on to the We're on to the pat-on-the-back part of the presentation, where we have a look at the criterias th that Paul the criterion criteria that Paul has has given us, and we can use that to tell How's it going? Anyone got any thoughts? How how have we done today? I think we did pretty well too. That looks pretty spectacular. Any other chang uh thoughts? Okay so th th what about um room for creativity? Is it the. I I think we we ended up being quite creative there. Mm. Not every idea necessarily, it's still a remote control. Uh no yeah but we did we did break with the specs a little bit I guess, but the uh 'Kay leadership, what do we report back to the bosses? No th th I think they were r reasonably flexible with us over the whole changing the specs thing. I agree. Synergy. Teamwork, yeah he is uh. What did we think of the meeting room, I guess is an important thing here. Mm. Yeah, this falls off and uh the white board worked really well without any pro Mm-mm, lapel. Wha okay, oh, alright. That's it's down, it's quite close. Keep it, keep it calm. Oh dear. No more pizza for me. So yeah the the pen came in alright and it's a little uncomfortable to use but I guess it works. Nah, I'm I'm not convinced of that at all. I've been wor I've been wondering about that all day, but see these look like they're that looks the oth that looks like it would be that way around, but it feels more

comfortable, wh what you call upside-down. I don't care. Uh okay so that data might be slightly invalid. What new ideas have we found? Well let's do both then. Uh for the product? Yeah we came up with quite a bit. And for the meeting room, Has anyone got any more Yeah less sore on the ears. Okay so Are the costs within the budget? Nope. Oh hang on it really that's something we that the costs were under twelve fifty Euros. No requirements are changed. We're still under twenty Euros to build, so we're good. And the costs within the budget? Not the original budget, but they are now. Is the project evaluated? Mm I think so yeah, then celebration as it says. Oh I don't know how that got there. Uh anyway. Thank Thanks guys. Yeah, I've got a lot of paperwork to catch up on too. Oh. So you forgot how this works again? Boss. Hmm you knocked it up? Thi third third third. The end product thingy. Yeah.. Um yeah so what we ended up with. Production costs estimated by our manufacturing department and um the research department, which is us, is uh fifteen point eight Euros, someone forgot the units there yeah, uh unit price unit production price cost thing. Um we implemented the basic functions, which is just T\_V\_ functions plus the locator, which was one of the marketing things, cradle, scroll wheel for uh the the channels, and uh we implemented the f the the way of putting the new and revolutionary zapping, your favourite channels functionality, in the scroll. Yeah. Zapping you know zapping. Maybe it's just a Portuguese thing. And um yeah that was the result. Start s the the start uh to to to programme yeah. Not helping. Don't have no one to handle that. Yeah. So you ha you have like the the base station with um the little button for the where's my remote. The locator function. Wicked isn't it? Ja. Nah. It fell off. W we need we need we need s some more buttons if it would to work on some other stuff, but We we w yeah we could get another version of it that actually works. But uh Very co very col

f colourful. beep beep beep. Yeah. We don't It's a scroll. Yes. We're wicked. Awesome. Yeah. Yeah. That was mm-hmm Yeah. No. Yeah. Basically. It was more of a teamwork thing then really leadership based project was Teamwork. Yeah. And that's D you must have very long shirts. That's way far down lapel mic. Lapel lapel lapel. That's almost a crotch mi cr Oh dear oh dear. 'Cause this is you were using it o upside down. Still that Use them like that. Bunch of new ideas. Yeah comfortable headsets would be nice. Mm. Coulda been worse. Mm n no. Hooray. Free coke provided at the cafeteria. Who wrote that one? Cool. So so so. Maybe. Maybe maybe maybe. Bra Mm that's oh that's oh I like it. I mean you guys gave me more than I was asking for, so I'm happy because we've got some really marketable features in this. Yeah I think it's good. Good good good job. Uh pla I'm ha It's great. That's great. It's a great feature. So you can take this ho take this home with you tonight and you can push that and he'll be across town Uh, I can see that. Yep I like. Good job. No no. Well I mean of course, I mean My my s my suggestion is we're gonna go go to the silvers and blacks like most of the televisions. You know some blend of silvers and blacks. So you're not gonna find my uh my folder up there I gotta do mine up at the board. Yeah yeah. So No it's not in there because I had the computer problem and I I I cou I couldn't create it. I couldn't create it in the PowerPoint, and I think I've got this really strange cable. So what I had, basically going from the PowerPoint format, is that uh yeah yeah I like this a lot. Is this one of the tests is to see how we can adapt to s changing situations in the in the meeting room? So what we had is we had the method. That's not how you spell method, is it? No A\_.. So this doesn't go so fast this way. And when I speak about method I speak about the marketing of the product huh. And uh to me with this product we got uh we got basically three things to market. We've got the features, we have the uh characteristics, and we have the I I don't know what we would call the other part what we call you know the the the corp corporate Help me. The the corporation stands behind the product, okay. So the features I think we got the scroll, we've got the uh the locator, we've got the durability, we've got the

dependability, we've got you know the features that make this a unique product. Um the characteristics I talk about, we have reliability, we have comfort, we have ergonomics, we have environmentally sensitive. Uh and the corporation, we're talking about we're we're a new we're a new company. We're wanting to make a name for ourself. We're wanting you to uh find our product so we're gonna give you a good product at a fair price. One thing I would want to see is uh is can we can we get a lifetime uh guarantee on this product, a normal use guarantee, which means that this product, for the for the life of of the life use, if it should have a technical problem, that we could re replace it at no cost? That was something I would be interested in. Um so yeah without uh going into great details, we have a we have a product, it has the features and the characteristics, and the background, I believe, to make it marketable I believe at a cost of of of thirty thirty five to to fifty Euros. We're gonna be competitive, and we're gonna we're gonna have a market niche. Um w That that would be uh that would be I think a decision best made by corporate um I I m for my evaluation, based on what our competition is, I th I think that that we can go after this and and and go after more of the uh exclusivity sense than the mass market sense. But I'm sh I'm sure open to to market this in either direction. But you guys came up with a great product, and at that cost I think it uh there's nobody else that's putting this this combination of of ingredients together. The only limitations I see to this is that we're focused on television only. Uh t

hat's the only that's the only drawback I see to this. But with all of these other features I think people c one thing I'm I'm hoping for is people are not gonna even notice. There's gonna be somebody going home and say oh sh this thing doesn't work for my D\_V\_D\_ and my but I like these other things, so they keep it, they don't take it back. Well one of one of the thoughts that I had is can can this unit be be produced in a way that makes it upgradable? You know uh like like a um a sim card in a in a um in a telephone. You know is there a card in th can we make a card and so after Mm-hmm, but you follow what I'm s I'm s Yeah 'cause if if we can make this unit upgradable then we're yeah but then we talk about changing the warranty concept and everything, but that's that was just an idea I had. Uh to me the only additions Yeah. Yep. But anyway that's uh Mm-hmm. We've got a we've got a curve and a droop. I don't know whether that. Ooh. No, I think we come up with a with a attractive marketable um product and and concept. Yeah well we we we kinda broke we kinda at least adjusted every every criteria they gave us because we d we still have the the teletext capability in this thing right, we raised the price of it, we've added two t new technology to it. So you know you know if this thing flies then we've we've adjusted or broken every every idea they gave us. Yeah yeah yeah yeah. But I like I mean when I say we have we had I believe we have room for creativity 'cause w this is we did it. Cohesive yeah. Yes synergistic yeah. Yeah. You know you know what they're gonna have on the recording in there from that microphone is your lunch digesting you know th New ideas f uh for the product or for the the the the environment or what are we ta Oh. Well I I mean clearly remote control microphones would be the would be a nice solution to all these cables, but I'm sure that there's there's some justification for these things that I don't know about. And of course I did not have so much fun with my computer this afternoon. It's not been uh it's not been cooperating so well, but I don't think that's the that's avoidable. No. Okay. So we need to close this meeting, yeah bravo. Congratulations. S I've got a lot of paperwork to catch up on so let's close this and come back and 'kay. Put on your mic. Boss. Yep. Alright. Three, three. Pedro can have it. I like I'll help talk. Unit price. Scrolling through your favourites list. It's very prominent. So here I'll give you the so this is the cradle unit, and this is the actual remote itself. Um so the scroll bar is or the scroll wheel is this this green little scrolly guy here, um and then the volume controls are here and here. Uh you've got the keypad which is the numbers uh f from zero to nine and then ten. This is the power button. Uh we have our um we have the enter button and uh what was the

other button here? This is the teletext. The programme button, yeah the programme button. So this bl this button will be used both for the favourites and for programming your uh the um the type of television you wanna use. So um the plastic is the white area of this of the model here, and the red area is like a rubber covering. So you can see that when it lays like this or like this and the buttons are all gonna be rubber, so it's pretty hard to actually damage it um Yeah that might be a possible a mi uh possible problem, but if you drop it yeah. Yeah and it depends on if it's sliding, but I think it's pretty ergonomic. You can feel it. Yeah of course. Well this is clay. Yeah the the power button is a bit of a reach, but I think we might scale down the final model a bit. These this is a bit larger than it would be, but Mm Pedro can demonstrate the the paging ability. Beep beep beep. Um beep beep beep so beep beep beep beep beep beep be shut up. Beep beep beep okay. Um no no no tha that's alri Exactly that's exactly what those are for. And um there's one other feature that we were debating, but we decided to go a

gainst it, is um you could beep beep beep we were thinking that it might be interesting to have a trigger button here because you have this finger it it's it kinda feels like there should be something there, but we couldn't figure out what button is important enough to put there. And we we don't wanna accidentally be hitting the power button like that so Mm. Right. So maybe in a final design phase we might tweak that a little bit, but Mm-hmm. Oh no this is just what we had to work with at the time. So we'll leave the colour scheme up to the marketing people. Careful. Beep beep beep. Yeah. No way. Beep beep beep. Mm-hmm. Well, that was just just our technical team added up the um production costs of the individual units. Oh. Uh-huh. Uh-huh. Yeah. Oh, sorry. Yeah um I do think we that we we uh don't need the events chip on print, we only need the uh the regular chip on print, so there may have been a m miscalculation in there. And we and we have a single-curved uh Uh I think that It's single-curved, yeah. See it's a little bit more than f single-curved. So yeah it's fifteen point eight, that's where we came up with it. Okay. Yeah we do. Ah. What do you know. Oh it's a that's not very special, it's pretty If th. That's a scroll. Uh no we just use it as a scroll. It was a pretty accurate estimate I would say. Yeah. S 's kind of s frighteningly accurate. What? I think we did pretty well. Sh I think there was plenty of room. We got a couple innovative i Couple innovative ideas. Mm-hmm. Yep. There was a lot of synergy. These cables suck. Yep. Yeah. Lapel. That's our boss. Pedro's right. Pedro's right. Oh wel Well we had the favourites list, and the scroll bar, and we have the cradle, and the r uh remote call feature. All right. Good job guys.

# Meeting ID: 10

Data Source: Train

## Executive Summary

Today , functional design phase . The functional requirements , it's uh uh very important for uh the user , seventy five percent of the users find most remote controls ugly . Um they want to spend money for a better system , for better remote control , and um they use yeah , they use zap a lot , but um uh the relevant buttons are the power , the channel selection and the volume selection . but uh w and not important in the audio settings , display settings we can we can hide those under a menu or something , that was in the test , the the most people uh f find it uh irritating uh when they cannot find a rem their remote control , so uh I think it's a bee beep to sound it and uh you can find it . And another thing uh they want was uh speech recognition And they want maybe an uh L\_C\_D\_ screen We wanna have a little preview on the remote control . Preview what's on the channel . 'Cause it sounds pretty expensive too . Uh my personal preferences is uh a button for my favourite channel , it just remembers the channel that you are on most , for example . Yeah . some technical functions . There are many buttons on a remote control which are not clear . Uh also symbols tend to fade after a while . this is basically what I h had in mind in the fade-proof symbols , locator , a sound , And possibly also the size , so more important buttons , bigger but more less buttons , easy , some bigger buttons . Yeah , it's true . So we agree on the the part that we need to get something on the on the remote to find it somewhere so if we make a circuit board with the the connections already on it , then that's cheaper . You have the the power coming in , The switch uh uh uh if you p press it then some electrical charge goes into the processor , that thinks over a Morse code , then uh the signal is sent to two uh light bulbs . You have infrared Uh I don't have any personal p uh preferences uh so far , except for uh the materials to be used uh light , that they are light . Like you said uh teletext is not not very popular anymore I don't think we should remove the button , But I don't think it should be very it should be one of the big buttons for example . This is a new product and with this new product we want to appeal to younger people , um the younger people were defined under forty . And one thing that should be important is that the corporate l colour and slogan are recognisable , which is apparently black and yellow , With that concept I started thinking , so why not just steal Nokia's idea and just make changeable covers for your I think this is a good idea . I think we should lose the L\_C\_D\_ screen , Y Yes , I think so too . I think it takes up a lot of a lot of power . What we could do , what could be possible , is maybe not an L\_C\_D\_ screen but with a preview , For example , a little T\_V\_ guide . I'm not sure it's even possible , I have to check that out , I think

the p yeah , the beep is a very simple thing to imple implement , just make a button on your T\_V\_ we should go for that . then uh I'd like to know now if we want the uh universal remote control or not , because that's uh determines everything I'm gonna do . I think it's universal . I think we should go for universal , Speech recognition , I think it's very hard , because we're selling across multiple countries . Besides that , the technology isn't really super yet , but it's just not I don't think the market's ripe for that yet . you should you should look into the in into the materials that are real durable . maybe a little harder plastic If we uh make a remote control with changeable covers , then we can also make uh a cover for every language area . But should the exchangeable covers include the buttons themselves it's not even a bad idea . For example , if your buttons are faded , after I mean if you make a durable remote , they are faded , you can just buy a new cover . Uh we can make something that you can only remove the sleeve . it's just just a one one piece of rubber for example , something I have to look into . you have to come up with a components concept , you should do some trend-watching , I think it should be have less or I very little buttons and maybe a second second level menu for the advanced things . Or maybe just stick 'em under a menu , Is it techni technically possible to uh send a signal to a television and then pops up a menu , because we're working with different types of television , That is true . I don't think so . A double-sided remote control ? I don't think that's useful . but you can't you cannot take into consideration all the different brands of T\_V\_s . because usually the the menu is the menu button is is usable between different brands . Especially the big ones , the big brands , if you can put some research into that , if it's possible . I think it's possible , I thi I think so too . Maybe it's a little more curves or whatever . And uh with different colours uh . I'll put some on paper and present them next time uh the ideas that I have . we could do some i do some work now on on the design for example . and since you're holding it like this , I suggest you put the channel up channel down and volume Think it's like this . I think that the the buttons should be the channel buttons should be uh on their own . Uh maybe the menu button can go i in the middle . Yeah , in the middle . Perhaps we should also make uh something like a flash on it , if you if it's lost , for people that are deaf . but for example if it's lost in your armchair , we'll not see the flash . We could make a combination that it goes beep and that you that some light lights up . We could do that . uh the power button somewhere over here ? I usually press it on top . Mute . I think it should be at the bottom somewhere . Around uh not uh not at top at the around the volume selection . Shall we uh also look if it's possible to make a rechargeable remote ? I'm not sure y I'm not sure it's if it's expensive , but just take a look at it , to have uh like sort of a maybe a base station that you put on the T\_V\_ . Could be flat , you could insert your uh remote into it . But I think that will cost a lot . Uh a normal wire would be better . I'm not sure if it costs a lot , And do people actually want that ? To pay extra they want to pay for rechargeable ? we could either make a separate station which just sends a signal to the remote control to either beep or flash to find it , we have to either that or make it integrated with a with a docking station . I think this is a brilliant product . because if they're willing to pay more , we could lose a little profit and maybe attract more customers , Could you post some other essentials of what people want , Where would we want the uh teletext button ? Do we put it somewhere over here ? Or maybe this is something for the next meeting , draw us up some some designs of of possible just keep in mind that the important buttons should be on top and either big , we don't want we want very little buttons , just the buttons you use a lot . because some T\_V\_s have the uh possibility to adjust brightness , that kind of menus . but that's what we stick under the menu button .

Because it needs to be configured in the television under the menu . If it isn't , then we cannot reach it . But I think most modern T\_V\_s have it in their menu . Uh isn't there a possibility to do research on that , so we know that for sure ? Um they want to pay for an L\_C\_D\_ screen and speech recognition . Oh , we're not going to be able to sell it for twenty-five then , with an L\_C\_D\_ screen . Yeah , just look at the possibilities then , we should do a little thing about design , because it looks boring really to me . Different colours maybe . And the design , it should differ . let's say that people would want an L\_C\_D\_ thing . Let's take the basic design again , what we oh , crap uh came up with . If you're reading from top to bottom , I think it's better to put it uh at the top . How can you use an L\_C\_D\_ screen ? But nee the function of it . So we have three people saying it should be on top . Do we put the volume control and the channel control here , In the middle . Maybe in a circle for example , like we like in this example . I think the channel button should be in the centre . but we do agree that we keep this at the centre , but if we need two batteries and an L\_C\_D\_ screen , that means a lot of space that we need . But it has to be a little bit heavier . Just to do research into both , w what it costs and what it takes for space . uh let's give this uh a name , and not like some vague serial number that no one understands , like with cars . Yeah , let's think of a name , okay . the minutes will be on the on the web shortly , If you rule out functions , then uh and that gets known , then people are not gonna buy it . I I'm not sure .

## Complete Meeting Transcript

Okay, we Mm. Okay, that's fine. Um. Okay, now work a little with me. Okay. Well, let's start it as it is. Okay, uh the method. There are a few questions that need to be answered, uh you already uh talked about it a little bit. Which buttons are wanted, uh is our remote control universal or should it be programmable. Uh if it should be programmeab grammeale then we need um something like a mode that you can switch it. Because then the buttons have to send out a different signal then they would normally do. And uh how big is the remote control uh going to be? I'll tell you why that's important to me. Um there are a lot of technical parts in the remote control, so uh uh that's why I also would like to say uh go a little bit easy on the designs, uh I heard ab uh you talking about beeps and about uh video screens, but uh the material inside and the technical aspects are quite complex already. So keep in mind that everything that you keep uh think of, it has to b to be built. So it's that's not as easy as it s might look like. Uh material study, I'm working on that um for the the costs. I have to check out how far I can go with that. Normally, a circuit board is made of fibreglass uh and the wires are made of copper. Uh that is how it is done and all the remote controls work that way, I think we can just go on with that. Um then I've read more integration of materials means less cost for the production. The more we can make uh at once uh in one piece, uh that is cheaper. Exactly, so if we make a circuit board with the the connections already on it, then that's cheaper. So we have to make something that's not too difficult in design again. This is what look like uh looks like if you press one button, so this is not the entire thing. You have the the power coming in, then you have like a switch. The switch uh uh uh if you p press it then some electrical charge goes into the processor, that thinks over a Morse code, that's how you should see it. The Morse code goes to the amplifier, then uh the signal is sent to two uh light bulbs. You have infrared and an interv um uh how to say it? Uh a light in indication, light that you know that it's

functioning. Uh here again, that's my story about the different modes, if you do want to make remote uh universal, then the processor has to uh make up a different Morse code when some button is pressed. That makes it much more complex, so we really need to have a look, do we want that or not. Uh I don't have any personal p uh preferences uh so far, except for uh the materials to be used uh light, that they are light. That was it. Hmm. Yeah. Mm-hmm. Hmm. No, I think this is a good idea. But Go ahead. Y Yes, I think so too. Yeah. Okay, uh Mm. Hmm. Mm-hmm. Hmm. I have to check that out, I'm not sure. That must be possible. Ja. I'm sorry, whe where do you wanna hit the T\_ you wanna we want a button on the television. In th okay, but that rules out a universal remote control. Because that's not possible uh. Uh. Yeah. Exactly. Okay, then uh I'd I'd like to know now if we want the uh universal remote control or not, because that's uh determines everything I'm gonna do. If not Okay. Okay, then I go for that. Yeah. Okay. No, it's fine with me, but then I know what to look for. Uh-huh. Mm-hmm. Exactly. I already noted that. Mm, okay. Okay. Hmm. If we uh make a remote control with changeable covers, then we can also make uh a cover for every language area. That's fo is uh especially for older people, that they can read it read it in their own language. That's okay, okay. Huh. Uh okay. Hmm. Hmm. Mm. Okay. Uh but I know that the buttons are like a Nokia telephone on uh one sleeve, so you don't have to change your whole cover. Uh we can make something that you can only remove the sleeve. Know what I mean? It works the same as a Nokia telephone, it's it's in my uh 'kay. Exactly. Hmm. Mm. Yeah. I don't think so. No, I don't think so. Because the television needs to respond to the signal, and if it doesn't know how,

it's Exactly, that's not possible. Hmm. Mm. Mm. But that might be broken. Hmm. Hmm. Hmm. Hmm. Mm okay. Mm. But I think there must be a way uh to invoke the more complicated functions of a television. For instance, if your old remote control is broken and you buy ours, then uh you should be able to get everything out of the television that's in it. Because otherwise you'll lose functions by buying our Okay, I thi I think so too. And I think that our r remote control should not look like uh any other. For instance uh Sony makes all their remote controls exactly the same for all their devices, and you always grab the wrong one because formatting of the buttons is exactly the same, only the labels are different. We should not do that. Exactly. Mm that's your uh division. Hmm. Yeah. Perhaps we should also make uh something like a flash on it, if you if it's lost, for people that are deaf. They they won't hear the the beep. Yeah. Uh. Yeah, it's true, but it's it's only has to do so when you press the button that it's lost. So. deaf people? I have another idea, I'm not sure if it's possible. Mm. Yeah, me too. Shall we uh also look if it's possible to make a rechargeable remote? That you don't have to buy new batteries if every Mm, yeah. Uh. But that's already possible. Yes. Yes. Okay. Uh you could make a device, but I'm not sure how that uh is possible with the costs, that you can put in normal batteries, rechargeable, but it you're the remote also can act as a recharger. So then you can choose, you have every decision. Know what I mean? You can uh put in normal Penlites, rechargeable Penlites, but they can also be recharged with the remote, with a wire. So but But I think that will cost a lot. Uh a normal wire would be better. Like a like a P\_D\_A\_, a hand-held. You can uh just put it in the electricity and it charges itself, you don't need basic station. Yes. That is possible, that's true. Mm. Yeah. Yeah. Mm. Yes. I'm going to try to find that out. I'm not sure if there's information available on this, but Hmm. These are uh comfort issues. So I think people will pay they wanted to pay for comfort. Well, this is comfort. Yes. Hmm. Yeah. Exactly. I think this is a brilliant product. I would buy it myself. Uh. I like the covers. That's a brilliant idea. I never thought I hope if I have information about that, I'm gonna Mm. Yeah. I would like to make a decision. What it costs and what kind of materials that we can uh choose what we want in it and exactly, I need it. Was it not possible to uh send emails around the office? Not. Yeah, okay. What uh what did you wanna

say? Mm. Mm. Mm. But that's the question, is it? Because it needs to be configured in the television under the menu. If it isn't, then we cannot reach it. I think so too. I think so too. Uh isn't there a possibility to do research on that, so we know that for sure? If you rule out functions, then uh and that gets known, then people are not gonna buy it. Then the consumer bond or something says uh you cannot do this and that with it. That's a bad bad com commercial for okay. That's true. Hmm. Hmm. Did they really said it like that? Those two things. Do they realise how much that costs? That's almost undoable. No, that's that's. Even if i if we have this lost unit, then we cannot do it for that price. Yeah, that's true. Mm. Hmm. Uh. Uh I But I really need finance information. We all do. Mm. Uh. Hmm. And the design, it should differ. This is Philips, huh? Philips has this. Okay. Hmm. Uh. Mm. Oh, I realise if we make it small, then it needs to be a little thicker, because I need to put all the electronics in it. If we make it s uh smaller, uh less wide, then we need to m make it a little thicker, because I have to put all the electronics in it. No. Hmm. Me too. Ah but. Hmm. No. M I personally would prefer it on the top. Huh. But it Hmm. Mm. Hmm. They want it uh. We should just try to make that if it's possible. If it is possible we should really do it, but we need that informatio

n. Also keep in mind again, the L\_C\_D\_ screen is very flat, but it needs transistors, resistors, I don't know what more and that needs space. So I have to look if that's possible. But if we Hmm. Hmm. If we have a a space issue, we can also lose one battery. It is rechargeable, so we can stick with one instead of two. That might be an option. Yeah, but if we need two batteries and an L\_C\_D\_ screen, that means a lot of space that we need. But it has to be a little bit heavier. Okay. No, but the things behind it. space. Like a process uh. I like this one more. Mm. Mm. I'll try to. One more uh thing I'd like to say, uh let's give this uh a name, and not like some vague serial number that no one understands, like with cars. Shall we all try uh to think about a name? Good luck. Yeah, I've Do we uh save the? Yes. Sorry, a little bit of pl little problem with computer.. Uh. Yeah, sure, no problem. Um there was a little problem with my computer so not uh the whole uh presentation uh Yeah. Um Okay, and I want to open the my s oh no. Oh no, that's okay. Uh slide show. Yes. The functional requirements, it's uh uh very important for uh the user, he he wants to yeah. The the method we used uh it's not m not a slide, because it went wrong, but the method we use uh, um we tested it w uh with uh a hundred uh men, and we asked them to w uh what the remote uh f feel uh like and uh what what's uh important. Uh People, sorry. Both women and men, yeah. Okay. Uh the findings um uh seventy five percent of the users find most remote controls ugly. Um Yeah, and yeah, most th th they want to spend money for a better system, for better remote control, so we can do uh a l a little uh nice things with it, and um they use yeah, they use zap a lot, um uh fifty percent say they only So that's the most important things. Um oh yeah, not all of it is it on mine on my PowerPoint presentation, but um uh the relevant buttons are the power, the channel selection and the volume selection. It's uh the most basic buttons that a user wants uh to use. Uh less important is tel teletext, uh um they use it, but it's not uh very uh important uh on the scale of zero to ten they six and a half uh and but not important is the channel selection, the the hmm? Oh, the the no no no no no, that's very important, but uh w and not important in the audio settings, display settings and uh Yeah. Um new preferences preferences. Uh um um beep to find your control, was that was in the test, the the most people uh f find it uh irritating uh when they cannot find a rem their remote control, so uh I think it's a bee beep to sound it and uh you can find it. And another thing uh they want was uh speech recognition um so they can say uh what they want to let's go to channel one and uh that's uh kind of things. And they want maybe an uh L\_C\_D\_ screen um to to look it um wh what's on every channel uh and uh what do I want with it? Yeah. Yeah. Yeah. Um Uh my personal preferences is uh a button for my favourite channel, so I can uh I dunno, so I can zap to my uh f uh quick uh to my favourite channel wh

what I uh so, the remote mu must see or um must um see wha what mine preferences are for which channel, so I can zap t to What? Yeah. Yeah. Recognise Yeah. Yeah, that's uh what my personal preference like. No, itself. Maybe it's easier to to sell it, but I don't know it's manageable, but we will uh we will see. Yeah, it's a little bit uh it's the end of it. It's a little bit uh I lost it, the computer uh crashed, so. Yeah. Darn computer. Yeah. Yeah. Yeah. Mm uh. Yeah. Uh. Yeah. B Yeah, and they want to pay for it and uh With more Where with more technical specifications in the Yeah. Yeah. But oh? Yeah, with with an L\_C\_D\_ screen you can Why? Nokia w Uh. Okay. Yeah. Yeah. Mm uh. Yeah. Um Everyone uh wants to buy it, so we w yeah. Yeah. Or one. Or when you say one two uh i it uh it's enough, right? But Oh yeah. Yeah. Okay. Yeah. Yeah. But b But every Oh. Yeah. Yeah. Yeah. Okay. Yeah. Mm yeah. Yeah. Ye

ah. Yeah, yeah. Yeah. Um yeah. And uh with different colours uh. Okay. Yeah. Uh. And a light uh Volume. Uh it's it's fine, I think. Oh d Yeah. Just And L\_E\_D\_ uh on it. Just a light on it or Very important. Oh, that's It's And But you r And you are reading from the t you always read from the top to the the bottom of it. Yeah, so it's Yeah. So i it's sorry? No, it's no. Uh. Hmm. Or or with the volume selection. Around uh not uh not at top at the around the volume selection. I don't know where exactly, but Wha No. Yeah. Yeah, that's better. On the right. Yeah. Maybe it's more ex expensive. Yeah. Hmm. Yeah yeah. Yeah, that's g But Which Yeah. Yeah. But Yeah, they want to pay for it. Yeah. Th uh there was not a el ask esque But But f hmm. Yeah. Yeah, okay. Yeah yeah yeah. Yeah. Yeah. Yeah. My computer crashed, so uh I lost my uh presentation, but I have the uh Yeah, but I Here I have the the s the homepage of uh our internet, and here is my here is my marketing report, maybe you ca you can look at uh that and Ah yeah. And one And uh wha what people want, I've uh I have another thing uh Yeah. Um Uh what I al already said is the the uh the remote controls are always lost, but it it's also for people, they want to learn it fast, not uh they want to No It's yeah, it's easy to learn wi and uh Um And The If Um If um Another thing I want to say is that uh we are looking at the market for the age uh younger than forty. Um on my report, I didn't uh ish I didn't show it in my uh presentation, because my computer crashed. Um they want to pay for an L\_C\_D\_ screen and speech recognition. So i yeah. Yeah, and Yeah. Uh but If if they So uh we can We can look at the possibilities for an uh L\_C\_D\_ and uh I dunno. Yeah. How much it will cost and Um It will come uh Yeah. Different colours maybe. But all Okay. If you're reading from top to bottom, I think it's better to put it uh at the top. It's j Uh. But i if you if you are going to uh put the L\_C\_D\_ on it, I think it's very important to use it, uh because it's use it uh But nee the function of it. So you can use it maximum, because uh it's a lot it costs a lot. So Yeah. It's expensive to build it, so you must use the maximum of it. Huh. Uh. But uh Yeah, I know uh. In middle of it. In the middle. Yeah. It's the most import yeah.. Finish meeting now. It's on your computer. Uh. Or And uh what about speech recognition uh Yeah, yeah, but or or an L\_C\_D\_ or an uh speech. I think it's L\_C\_D\_ is better now. Yeah. Yeah. Yeah, okay, yeah, that's yeah, that's okay. Oh, good. Yeah. Same... Oh, there he is. Go ahead. That's pretty shocking uh. Which channel selection? Oh, okay. Is that manageable? 'Cause it sounds pretty expensive too. Okay. Okay. Shall I go? Okay. So, some technical functions. Basically I have some issues which you discussed earlier. Uh let's just start with the method. It sounds really easy, what does the user do, what does the th remote control do, but there are quite some issues. So the things I'm going to concentrate on are the user aspect, because the technical aspect, that's pretty much covered. We can do that. What goes wrong at the user. Gets the remote control. Where is the remote control? We've all had it once, I want to watch some television, where's the remote control? That was one of your ideas which you posted in the network folder, a really good idea. Uh these are just the issues. I come to some uh personal experience, findings, possible solutions

later. Searches for the button. There are many buttons on a remote control which are not clear. Uh so either we lose those or we try to make it a little bit more clear. Uh also symbols tend to fade after a while. There's nothing more annoying than faded symbols, because you don't know which channel is this button, so possibly we could find uh something for that, yes. Uh covered that. Oh yes, user presses the button. Um usually when you have a lot of buttons, buttons are small. So you press more once remote control goes kablouey or som

ething like that, so we have to pay attention not to put too mun too many buttons on uh the remote control. And possibly also the size, so more important buttons, bigger si So this is basically what I h had in mind in the fade-proof symbols, locator, a sound, uh so clear we should stick to existing symbols, but maybe we could do a little uh investigation to see whether some symbols are uh need to be replaced by others. Uh This I pretty much covered. So what we want to go to is not this one, but more less buttons, easy, some bigger buttons. So that's basically uh what I had in mind. This is not the final design, this is just a general idea of how I'd like to see uh basically the general idea. So that was it. Yeah, I think it's a really good idea. Yeah. Yeah. Okay. Yeah. Oh. Is it manageable? Is it easy? Yeah. And it costs too much to fabricate, so we're on a tight budget here. And it's Maybe just a slap-on sticker with a button which sends out a small signal. Yeah, exactly. And it's Besides that, the technology isn't really super yet, so that is a problem in implementing this. It's a good idea, but it's just not I don't think the market's ripe for that yet. But should the exchangeable covers include the buttons themselves or just the C that's a problem with the with the text then. Oh yeah, I know what you mean. Yeah. Pretty straightforward. Is it techni technically possible to uh send a signal to a television and then pops up a menu, because we're working with different types of television, so we're going to work with that? It's an in-built menu, isn't it? Yes. So basically we Or we could use a double-sided for less used functions you Yeah, with the cover. I it's basically an idea to overcome these issues, because No, but basic functions but functions which are not frequently used. Because if we use a universal remote control, we're going to have to have most buttons on it, so Yeah. Yeah, I have some ideas. I have some ideas. I'll put some on paper and present them next time uh the ideas that I have. I heard a beep go. Yeah, but we like some some curves or Yeah. Oh, we get the general ideas, yes. Yeah, and since you're holding it like this, I suggest you put the channel up channel down and volume yeah yeah. So you have the up channel the down channel the volume, do we want that horizontal or vertical? This is basically what people are accustomed to, so Yeah, but this is just a g general idea. Uh maybe the menu button can go i in the middle. Whoa. You won't be able to find it. We could make a combination that it goes beep and that you that some light lights up. So we have the basic channels we've got here, uh the power button somewhere over here? I usually press it on top. At least that's what I'm accustomed to. What would you like to? Okay, mute button. Is that somewhere here? Is that used often? The mute button? Do people use that often? 'Cause uh I'm pretty much accustomed to it right over here, at least in general, but It's not that important, no. Sure. That's pretty much what people are accustomed to, aren't they? Well, I'm accustomed to the channels being on top. But isn't that expensive in the entire package? But again, isn't that too expensive? 'Cause that means that we have to implement rechargeable batteries, a docking station And do people actually want that? To pay extra they want to pay for rechargeable? Can can we save this or Yeah. Could you post some other essentials of what people want, so that I can work with some buttons, where to put it You seem to have information on that, I'd like to uh see some of it. No, it's not. No. Oh, your computer. Okay. Well, I have your PowerPoint presentation, I can get some inf information out of that. Let's see. Oh, where would we Where would we want the uh teletext button? Because we decided that it's n not that important. Do we put it somewhere over here? Or maybe this is

something for the next meeting, I can draw out some ideas. Yeah. Well, we have decided more or less the basic

structure. I can put the other buttons in. Yeah. Yeah. Maybe another idea uh. Yes, but it should cover all the functions, so possibly, just an idea that popped in. Yeah, but we could go a step further, because some T\_V\_s have the uh possibility to adjust brightness, that kind of menus. Yes, but it's because we're making. We need to adjust to the technology. True. No, I think. Oh, we're not going to be able to sell it for twenty-five then, with an LCD screen. Well I doubt it, but well, I had basically something like this. To make it kind of futuristic. So what kind of. Yeah, sure. Now it's pretty much tucked away in your hand. I'm still not convinced of the. Yeah. So basically what we have to decide now is uh what goes on top. Do we put the volume control and the channel control here, or do we put it on the side. Would we like to press it in the middle? Yes, but we do agree that we keep this at the centre, because it's basically the most important function. Well, that would make them quite small. So maybe you'd put them here. Yes, but a big remote control probably not something which people would like. So would we like this or would we like the other. Let's see what we have here. Okay. So I think of a name. So Yes, go and finish up and I'll see you at lunch. Yeah. Wait for the marketing director actually, so. Anyways. Uh. See, shall we wait? I'm not sure if he's late or delayed or whatever, so I'm gonna start soon, we have now don't have much time anyway. There you are, okay. Uh no problem. We're about to start, so have a seat. Okay, welcome again. Today, functional design phase. I'll take you over the minutes of last meeting. Okay, that was just to get to know each other, have a little thoughts on what your vision is and on this project, so I put the minutes on the table I made on the on the project share, so if you wanna review them, they're there. I will do so after every meeting, so if you have some information you wanna take back you can find it there. Anyways, um today three presentations, from every one of you. Um after that I got some new project requirements from project board, so we're gonna go after over this later. But I wanna start with uh stuff you did first, so we can see what everybody came up with. And after that we can have the new requirements and share some thoughts, so. Who would like to go first? Take it. Anyway, let's see what you have. Uh it's still a bit open. You should close it on your own notebook, I guess. Yeah. So there? Okay. If I can cut in, is it people or men? Is it people, okay. 'Cause I thought it was only men, so 'Kay. So we have to do something about that. Okay. Okay, just talk ahead. Mm-hmm. Mm-hmm. Okay, that's okay. That's a little weird. Okay, we can we can hide those under a menu or something, okay. That's like a button on your T\_V\_? Remote, okay. Okay. We wanna have a little preview on the remote control. Preview what's on the channel. Okay. That sounds too good. It's possible, but uh I think it's expensive, but do continue. Okay, you don't set it yourself, it just remembers the channel that you are on most, for example. You want the you want it to be programmed, for example y programmed f or you want it to recognise your favourite channel? Let's see, you you spend twenty minutes each day on that channel, so it recognises your favourite channel. Okay, so it's it does it recognise itself, you don't have to set it. Okay. Okay. I see. Okay. No problem, it's okay, that's Yeah, go ahead. That seems very good. Mm-hmm. Okay, so have it more make it more durable actually. Okay. Okay, so the buttons should be. Mm-hmm. Yeah. Wow. The size. Yeah. Make it make them bigger. Even more durable uh. Okay. Yeah, it's true. Yeah, that's clear. No, of course uh Yeah. I must say that it's. Hmm. That was it. Okay, that was good. So we agree on the the part that we need to get something on the on the remote to find it somewhere and increase the durability of the thing, so. The other as

pects, we'll just see how what you came up with and what's possible for that budget. Okay. Mm-hmm. Mm-hmm. Yeah. Of course, hmm. You mean integrate them all into the circuit board. Okay. Yeah,

okay. So you have Mm-hmm. Okay. Okay. That was it? I'll get back to my thing then. Uh Okay, back this up to the screen. So I got some new information on the project specifications are changing a little. Like you said uh teletext is not not very popular anymore because the uh the internet, nowadays people don't use the teletext anymore or hardly, so it can either Well, I don't think we should remove the button, because there are always people who are using it. But I don't think it should be very it should be one of the big buttons for example. Just put it somewhere or under second option or whatever. It's not important anymore. Um we're targeting young people now, because our um This is a new product and with this new product we want to appeal to younger people, which are um the younger people were defined under forty. I so I think it's that's also good with the fashion and everything, so yeah. They want to pay for it, people are willing to spend money actually to buy a um remote that they like. If they like the way it looks, the way it functions, so they're actually gonna spend uh spend money on it. Yeah. see how far we can go with it anyway, so And one thing that should be important is that the corporate I colour and slogan are recognisable, which is apparently black and yellow, but I'm not sure if we I think we should keep the the logo in mind, because with colours you can uh have a lot of uh fashionable colours and everything on it, which suits everybody's taste. So With that concept I started thinking, so why not just steal Nokia's idea and just make changeable covers for your I mean those cost hardly anything I think, and people could even spend extra money on buying a cover and so have an entire new remote control that they like to see. Or we can sh for example we can make a different a basic design. And sell the covers separately, for example. That's just a little marketing idea that could be applied, so you can p it appeals to really everyone. So you don't have to I think you don't have to make entire remote controls. We make a basic one and manufacture this cover separately. So that was that was my idea on what we could do to appeal this product to everyone. So just I'm not sure if you came up with anything in the meantime, after making a presentation. Would you like to share? Okay. Oh yeah. I think we should lose the L\_C\_D\_ screen, like you said. I think for example it's it's huge I think the L\_C\_D\_ is huge, it consumes batteries like hell. I think it takes up a lot of a lot of power. It costs a lot, I think. What we could do, what could be possible, is maybe not an L\_C\_D\_ screen but with a preview, but y I'm not sure if it's even possible. For example, a little T\_V\_ guide. Like you have a little just just a text only, not colour, just a little text thing so you can use your remote as a T\_V\_ guide. I'm not sure it's even possible, but maybe okay, make it Yeah, find a little compromise in that, but What did I write down? I think the p yeah, the beep is a very simple thing to imple implement, just make a button on your T\_V\_ and just hit the button, it beeps somewhere. I think it's easy to implement, we should go for that. Uh speech recognition. I thin Yeah, I mean where else should you put it? Yeah, but how are you gonna use that if your I mean if your remote control is lost, how are you gonna press where are you gonna press the button? A slap-on sticker. Oh, you mean as like a separate thing you can attach to your T\_V\_. Yeah, that could be possible. A little little box you can attach to your T\_V\_ is fine then, okay. I think it's universal. I think we should go for universal, because apparently we're a separate company making separate c remote controls to sell to a lot of diverse people. I think universal remote control should be possible. Yeah, I think we're targeting everyone, so remote Okay, universal is good. Speech recognition, I think it's very hard, because we're selling across multiple countries. So I think implementing speech recognition is such a small um apparatus, it's very hard to do. Yeah, but I don't see Arabian people speaking one, two uh whatever. It's Yeah. It's not a mature technology, I think it takes a lot of memory and everything in in a remote control, so I don't think it should be implemented in a remote control yet uh. What else do we have? Um well you should you should look into the in into the materials that are real durable. So the the the symbols won't fade, maybe a little harder plastic or

especially if we don't maybe we don't have to do all the buttons, but especially the ones that are the popular buttons, so those always fade first. Mm the thing is the most important things that we have now. Let's see. For example? Well, we're not we're not targeting older people, we should remember that. Everything we target is under forty, so. You assume that that they read correctly and I think they're The most important thing about young people is that they're really sensitive to trends that are passing through the world, so No, of course. No, I think it's just something you put over them, because Yeah we can Yeah, you can Well, that's not a that's not a bad that's not even it's not even a bad idea. I mean, for example, if you're if you're into the durability issue you could For example, if your buttons are faded, after I mean if you make a durable remote, they are faded, you can just buy a new cover. Uh I'm not sure it's it's hard to make. So it's a good and a bad idea. Mm-hmm. Yeah, I know, it's just just a one piece of rubber for example, okay. Yeah, that's what I something I have to look into. Either either change both the buttons and the cover or just the cover, I'm not sure which is easier, so Um anyway, yeah, this is what we're gonna do afterwards, just lunch break and have more individual work after that, so let's see what we let's see we So you have to come up with a components concept, yeah. I want some you should do some trend-watching, because even if we're if we're gonna do those covers and everything, what people really want, that's what we need to know in this phase, because that's gonna be the essential final design that we're gonna come up with. Um Yeah, I think user interface is fairly obvious. I mean it should be very intuitive, s Yeah, it should speak for itself. Uh for example I bought a remote control last week with a new T\_V\_, it was it it's like all buttons and you have no idea what it does at first, and I'm total T\_V\_ new, anyway. So I think it should be have less or I very little buttons and maybe a second second level menu for the advanced things. Or maybe just stick 'em under a menu, like you said the um the sound options and the surround and whatever, they're more complicated, just stick 'em under one menu and uh give it a just put it in in s in a software piece, you can menu and you can uh select everything you want to to set on your T\_V\_. That is true. No, that's true. Yeah, that's true. I'm not sure if it's impossible, but uh there's a chance it's not, so. A double-sided remote control? I don't think that's useful. Yeah, but then you're gonna have a lot of wasted buttons. For example you have a Sony T\_V\_ and the half of the buttons won't function if you have a for a Sony that won't for a Philips T\_V\_. I don't think we should Yeah, for exam I'm not s yeah, for ex you have to make it a little decision between the part if you want a universal remote control that it should do what people usually do with their T\_V\_s, not not the very complicated settings that you can usually do that with uh either a old old remote control if they really hate that thing, but you can't you cannot take into consideration all the different brands of T\_V\_s. I think there's I think there is a stan

dard for example between uh because usually the the menu is the menu button is usable between different brands. Especially the big ones, the big brands, so. 'Cause everybody I have a universal remote control and it can use the menu button, so I think I'm not sure, if you can put some research into that, if it's possible. Uh I think just a b and the navigation is very basic, it's usually the same thing. Yeah. Yeah, that's true. I think so uh we need to put some research into that if if we can open the menu, I think it's possible, just the way how to. Yeah, then then you could do everything I suppose, because usually the T\_V\_s have that inside in this other little piece of software, so it's okay. Mm-hmm. Yeah. Yeah I think it should be a little distinct from everything else, because it's either it's both maybe the shape can be a little different. Maybe it's a little more curves or whatever. So um Yeah, this. Not sure what because we have forty minutes, I'm not sure how much time we have left for the meeting anyway, so. Yeah, but it wasn't me, it was him closing something. So anyway, yeah, we could do some i do some work now on on the design for example. I mean what do you want, do you want, but Yeah,

may maybe something like this. But though smooth inside. So you have the transmitter here for example. Let's see that you what would be handy. I think that the the buttons should be the channel buttons should be uh on their own. Let's see one, two God damn it. Yeah, okay. Another one here. Let's see what I think this should these are always on top of the of the control, so they should be here. Think it's like this. Withi within the Yeah, just take it. Do you take triangles or Um I think it should be I think it Maybe we should make 'em bigger or whatever. Yeah. Yeah, in the middle. It's it's usually uh there, but Mm. Yeah, but for example if it's lost in your armchair, we'll not see the flash. And flash takes up a lot of batteries again. Yeah. Yeah, I thought about for deaf people for example, so. We could do that. Uh let's see. Oh yeah, it's true. Um that thing should be central. You shouldn't be you uh shouldn't press it by accident, but it shouldn't be stacked away somewhere. Yeah. Yeah, like that's gonna work. Yeah, I thought maybe we should move the buttons down and put it here for example to From top to bottom. Yeah, that's true, you should I think the bu the power button should be on top, 'cause it's the first thing you do, turn it on. So power button on top. Um Mute. Do we hardly I think it should be at the bottom somewhere. Mute. Turn the sound off. I don't think it's important, but I think it I think it should be you c you could put it somewhere here. No, because it Yeah, people are accustomed to that, it's Can I have that? That's j Take this out and here see Uh are we gonna take triangles anyway? I'm drawing triangles, but Yeah, it's maybe a bigger lesser than thing. So anyway, I think this is should be the channels and or sh Here, okay. Okay, should we chan okay, this two, channel up and down. Well, for that is it's on one part it's um it's a good thing to recharge it Maybe we should what what could be possible is one with rechargeable batteries for example. You have just put Penlite batteries that are rechargeable, because it's an it's it's it's very annoying. I'm not sure y I'm not sure it's if it's expensive, but just take a look at it, because it might be a very good idea. Because if it's it's uh useful to have it rechargeable, but at the same time, if you don't want recha if you forgot to recharge it and you wanna watch T\_V\_ now, you wanna be able to put different batteries in it, use it now and not in half an hour. How about I think I have a nice idea. Not exactly uh. I think it's uh it's a pretty good idea to have uh like sort of a maybe a base station that you put on the T\_V\_. Could be flat, you could insert your uh remote into it. I'm not sure. A what? Well, we were talking about the fact that we want

ed to insert either a beep or a flash into the thing with a little separate signal or So you could put that on a T\_V\_ for example. It could be very flat, could be very small. It's a very small Yeah, I'm drawing it big now, but So you can put your remote on flat for example. And at the backside of remote just just a little hole for example um you just put it down, it recharges for example. I don't think it's very expensive. I'm not sure if it costs a lot, that that's what he r That's that you that's what you buy yourself. It's just an idea, we have to find out if it's possible. Do they want but they want a rechargeable one? I'm not sure, you should find out if it's if rechargeable is important. Yeah. They want to pay for comfort, we just assu we we could either make a separate station which just sends a signal to the remote control to either beep or flash to find it, um and Yeah, we have to either that or make it integrated with a with a docking station. I think it would be good actually. I like the beep part anyway. So um let's go through the Covers is covers is good. Yeah, it's Oh we can save this. Up and saved. We even saved the ant. Um Okay. So what we have is you have I think you have to do a lot of work on if it's possible for the cost. Maybe yeah, or maybe you can find out i what people are willing to pay. We are going for twenty five Euros sales price, but just try to find out what they're willing to pay for it, because if they're willing to pay more, we could lose a little profit and maybe attract more customers, uh we just have to see what it looks like. Yeah, if you have some financial information that that'd be nice, so. Hmm. No, it wasn't wasn't allo it was possible, not allowed, so. So that's um why I'm not sure that you're allowed to share documents on

the on the draft. I don't care. I haven't heard any complaints yet, so. Um Yeah, the oh, they inc uh they include the new one. Or just for you. Oh no, I didn't have that. All it tells just let's make make a new tick the new one. Um other side. Yeah, let's increase it a little because Yeah, draw us up some some designs of of possible just keep in mind that the important buttons should be on top and either big, so the more less important More or less. Just play a little with this, put I shift a little up or down and we'll see what looks best. Or just po post your designs from time to time on the product share. Yeah, so we don't want we want very little buttons, just the buttons you use a lot. Well what we had function that what people do, so. People change channels, people they change the volume and they they change channel, they turn T\_V\_ off and on, for example. That's the basic fu that's what you do I'm not sure who present that again, but those are the basic function that people use it for, so those should be very well represented. That's true, but that's what we stick under the menu button. Everything is you say in every T\_V\_ that's configured under the menu. Yeah, but But I think most modern T\_V\_s have it in their menu. Uh we'll we'll see what we can come up with. Under forty. Yeah? Mm-hmm. Yeah yeah. The want to pay for Oh. Uh shall we? Younger, age sixteen and forty five. That's all here, here it says Yeah, age sixteen forty fi interest in main features more critical. Okay, so we're not focusing on this. Um All the interest in features, not really the L\_C\_ oh here. Would you pay for uh speech recognition in a remote control. Hmm, okay? Speech recognition is quite Yeah, just look at the possibilities then, because if apparently it's what people want, it's supposed to be a luxurious remote, maybe it's not even that expensive. Or find a compromise, maybe just a black and white or for some extra information on it, on your programmes. Me too. I mean we all do. Right. I think it's something we should put into consideration. Apparently it's what people want, so. We should see if what it costs, if it's possible. Yeah. Yeah, we should do a little thing about desi

gn, because it looks boring really to me. Even if you put it even if you put a different cover on it, it looks still looks boring, so. I have no clue. I just drew something what which would fit into your hand easily. I think it's a very Sorry? Yeah? Okay. Mm-hmm. Yeah, but you have to j just keep in mind it shouldn't be too heavy. I mean we can stick it in in there, I think. Huh even if in the worst case we can even Could you give me the pen back? So let's say that people would want an L\_C\_D\_ thing. Let's take take the basic design again, what we oh, crap uh came up with. I'll just make it a little bigger now. So a transmitter here. Anyway. We could let's say we have an L\_C\_D\_ screen, people want an L\_C\_D\_ screen. So then we should probably put it here. It doesn't have to be really big, but just just have to be has to be there. Think it's a good place, people don't No? It's not that uh it's not the most important function, it's just an extra thing, it just you press the buttons on top, because your finger is on top. How can you use an L\_C\_D\_ screen? Yeah, but why I I'm not sure. Uh if you t if you press a button, you can see it, ri I'm not sure wha I'm trying to imagine myself what it would look like. You would prefer it n Okay. So we have three people saying it should be on top. Okay, but then you would would s have to stack away your buttons somewhere else. Anyways. Uh this looks a little About the L\_C\_D\_s thing. Well if it if it's if it's possible wi if it's not too expensive, we should include it, because it's it's cool. Uh we have green now uh Or maybe we should m we could uh draw draw something a bit that has it on on on the bottom. Maybe in a circle for example, like we like in this example. I think this is not good, but for we could make circular buttons for example. For up and down, ma make it a circle on it, because it I think the channel button should be in the centre. Channel button should be st stick together, for example here in this section. Because it's uh We're not sure about the size anyway, just a general design. You can make it as big as you want. For example if you take uh No, let's see. For example just Yeah. I don't think if we if we even use an L\_C\_D\_ screen, we need to, definitely. Yeah, but we have to see what the

si what the size is. The L\_C\_D\_ doesn't have to nee doesn't need to be very big. Mm let's see. Finish meeting now. Okay, we will. So either We either we have to decide what what people want. Either this one, this this could be the luxurious one. So we have channel buttons here. I'm just drawing something uh. Uh I think this would this would look cool. You could have it for example small buttons here for some extra functions, so if your basic function's here, we should like we decided before, programmes up and down, and volume here. Well you can just no, I'm not sure if we can do that, but we could put a microphone in here for example. Just to do research into both, w what it costs and what it takes for space. But let's cut the meeting for now yes. Yeah, let's think of a name, okay. Uh okay. Okay, at anyways, the the minutes will be on the on the web shortly, so there we go uh. Yeah, to all.

---

# Meeting ID: 121

Data Source: Train

## Executive Summary

actually we gathering here to discuss about the functional design meeting . and uh we'll issue some information from uh all of you . And it's in the , I think uh , in the sharing folder . And uh I will invite uh the Christine and the Ed and uh Agnes to discuss about on the various subjects . the agenda of the meeting is opening . Then uh I'm going to talk about uh the project management , and uh , of course , I'm doing the project management and secretary both , to take the minutes of the meeting . And there are three presentations . One is uh new project requirements . And the second one about uh decision on remote control functions . And uh finally we are closing . Uh and the meeting time will be uh forty minutes , management come with the new proposal , and I have to discuss a few points on this . Uh both says new insights in the aim of your project . Uh the one is uh the teletext becomes uh outmoded , okay because if uh because of the computer systems and the new technology . we don't need to consider really about the teletext all in our new project design . And the second one is about uh the remote control . Should be used only for the T\_V\_ . And the third point , it's very very important to establish our uh marketing or uh corporate image , okay , with this new project or new product . I'll invite uh Christine to discuss about uh the functional design . I I figured uh we should um identify some user requirements , and from my experience , I wanna uh , and from research I did , uh the the device has to turn the television on and off the first time you press on the big button , Because one of the biggest problems with remote controls is finding them . since we have to establish our corporate image on the basis of this new product , thought we better look at things that are popular and um ex go beyond those , um and then uh we might wanna talk eventually about the materials that are appropriate to use in uh in the construction , especially in the the uh the outside of the product I did a little history on uh the the uh remote controls all these devices are examples of where uh mm they represent examples that are available today which I think the one in the middle is r um really uh something to keep in mind . you could throw it at things if if the T\_V\_ didn't turn on and off , you could use it for something else . But um I just took some different uh schematics and I guess this is what a slide might look like if you were drawing a circuit board . personal preferences , um uh I I'm really thinking outside the box here , and I think that we should consider perhaps having an an an a a size uh a remote control that changes in size depending on the user preference . So something that's very very flexible and inflatable I think um it could either be you could go either one extreme , be very colourful , or you could make it clear , and um kind of blend in with things , Um I think

uh it needs to be waterproof , because uh sometimes they fall into cups one of my requirements was about needs t to tell you when it's done its job or not , because half the time , I keep pushing on the remote control , and I don't know if it's actually understood my message , so I think it should give you some sort of an oral cue . And uh , course I never wanna replace the battery . if you can add other facility , other feature , like uh unbreakable . because uh especially today , you know , you have the family and the kids , and the kids throw it if you can add the feature , okay , for your uh fabric whatever in your outline design okay , with unbreakable , I think that will give a lot of advantage for our product , Do you have any preconceived ideas in terms of materials ? 'Cause , for example , in the unbreakable thing , doing something plastic would be harder , whereas having something like , I dunno , steel or titanium isn't really economically viable . Titanium would be be heavy , too , um I wanted feedback , but we'll see what your uh personal preferences are and your thoughts . I like titanium . Expensive nobody told me how mu what our financial objective is , so um It'd be hard to inflate something ou made out of titanium though . because uh the last meeting we supposed to discuss about the financial thing . I know the project plan and the budget . I will I will send you a mail , At the end of the day , the company uh wants to make at least uh the fifty million Euro . and uh of course the price will be very reasonable on the the sales side . that maybe Eddie will talk to you about uh how much uh the price how much its cost for the manufacturing This remote control , okay , it can be for like universal , to use for any T\_V\_ . And I I have one maybe the suggestion or opinion . and it will be slim , Might be hard to find , though . But let's try it , okay , with the different uh the designs , okay , the functional designs . from the marketing yeah , from the marketing side , just to to give an idea what the management is looking for , I was looking for a a remote control to have a s I have a sales price of twenty-five Euro , with a production price of uh twelve and a half Euro . For what uh I think from what we're trying to find , we're tr we're looking for , I don't think that price is exactly in the market . in the recent surveys , uh from the ages fr from fifteen to thirty-five , eighty percent are willing to spend more money for something as fancy as trendy . Twenty-five Euros , uh that's that's a preson reasonable price . Now if we're gonna take a risk , and push this up a bit , make it more expensive , then it w it could possibly sell . But , I think uh there's one other thing interesting two things that are interesting is that uh from the fifteen to thirty-five year-old group , which always spends more money on trendy new things , speech recognition is requested . And we're talking between seventy-five to ninety percent of this group is willing to pay for speech recognition on a remote . Obviously , we can't make a remote into a computer , but maybe simple commands . louder , softer , on , off . Thirty-five percent say they're too difficult to use . So we have to figure out a way of making it um more user friendly . Uh fifty percent say they can't find the remote half the time . So maybe one word speech recognition commands , say remote , and there's a beep beep beep , But , in the cost that uh the management is looking for , that's not gonna be possible . But if it's trendy , if it's fancy , it's got some colour to it , if it's very easy easy to use , if it's got simple remote speech remote uh control , like I said , louder , softer , change channel , on , off , remote , it goes beep beep , So we're gonna have to look at it in a in this global idea , with the ideas of the industrial uh design . But , price obviously we have to talk about . What do you think about uh the design , uh what he was talking about of the speech recognition ? training is always an issue with uh commands . uh But um anyway , um I I think also that uh this might impact the battery life . maybe what we'll have to do is um add something where you can um recharge it wirelessly or

maybe uh set it out in the sun I can find my my remote without spending half a day looking for it and getting all upset and it uh , you know , gets uh , from the light , um a a solar cell inside there It seems also like with the speech recognition , yeah , it's a great feature , but if you're watching T\_V\_ , there's a lot of ambient sound , so then you have to make sure that the speech recognizer is good enough to filter out the T\_V\_ speech , and the the user's speech . Because tha w with speech recognition uh th I'm not that good at that idea Because I think s with speech recognition , if uh the the remote or like the telephone it has a exact word that it has to hear . I don't think it would come through a sentence in a television . what I can uh suggest to you , Christine , uh if you need some uh the technical feedback , or some training , okay , about uh this facility , especially for the speech recognition , I can recommend you some companies like uh Intel or I\_B\_M\_ , because they're already in this uh speech recognition part , and uh if you want , I can coordinate , okay , to get some information , and uh you can uh let me know , okay , so what kind of uh the details you require okay , to add this feature in this project . we need to know how much is the timeframe you need to develop , apart from uh what today . From from your side uh , you're gonna have to go back the management and s be more s precise . What do they want ? Uh , a risk , take a risk on the market ? Something that's gonna cost more , but could very easily s make a boom in the market ? Because it has to be something totally different , but end of the day , you're the sales guy , It's uh of course it's uh good to uh tell the management how much it's cost us I don't mind to convince , okay , the management to spend some more money on the project , okay , if you can make out of The management says , okay , so they they don't want certain facilities , they want something uh new , I think uh like uh speech recognit definitely they will agree , And uh I hope I can convince the management on that , the method that we usually use in the user interface design is that we need to look at what people like and what people don't like about existing products . So , in our case , existing remote controls . We seem to have intuitions about why things are good or things are bad , but when you look , technically , at how it works , sometimes that's not the case . Then we need to decide what functionalities we really want to keep , Um and then what the remote control should look like , in terms of the functionalities that we need , you obviously need to be able to turn the T\_V\_ on and off . You need to change channels , both by directly going to a specific channel or by channel surfing . You need to be able to control the volume and then control any menus on the T\_V\_ to regulate contrast or whatever . the problems that people have expressed is that there's too many buttons on remote controls , in general . The buttons it's not clear what they're supposed to do . Um often , you need to know specific button sequences to get certain functionalities done , um which you don't necessarily always remember , especially if it's a functionality that you don't use very often . here we've got two examples where here on the left-hand side , you can see a remote control that has lots and lots of buttons . The buttons , in a lot of cases , are tiny . they're labelled , but the labels don't necessarily tell you too much . Whereas , on the other side , you have a much simpler remote control that I think basically has the minimum functionalities that are needed . And it sort of looks simpler and just less imposing when you first look at it . So , I would be inclined to go sort of towards this , in terms of design , rather than this . And if there's specific functionalities that require more buttons , then we can figure out how to do it with existing um buttons . So my personal preferences are to keep the number of buttons to a limit , or to a minimum , make frequently used buttons bigger and more strategically placed , so like the on button being really obvious one , the channel changing and the volume , and to keep

the design basically sleek and simple . Clearly your research and uh and ours uh heading in the same direction , the only thing that I saw missing from uh your your research that we found was this uh ability to find the doggone thing when you need it . I also think that um uh th f the the feel of it is uh , when you hold it , is something that um uh was expressed more in in in in my uh design 'cause those are the parameters that an Industrial Designer's more thinking about , th th the look and the feel , that's for anybody need uh any help , for time being , on this uh subjects , okay , so please come back to me , and uh Christine , maybe I can uh try to help you to get some uh the technical uh the companies to help you for uh make a design uh slim , and to add some features , like we are talking about , the speech recognition and all . Should we maybe make a decision about what features we actually want to include , 'cause we've thrown a lot of features onto the table , do we actually want to incorporate all of them , or have we missed anything ? Do you wanna go back and look at the closing slide , maybe that would provide some guidance ? it says individual actions , so I'm supposed to do the components concept , supposed to work on the user interface concept , and you're supposed to keep watching the trends . Um and specific instructions will be sent by our our coach . I think we should do as many features as uh start with all of them right now and eliminate them later in the process , I was just thinking is it really practical to start designing something with features that we're just gonna end up throwing away ? I mean , it takes a lot of time and effort for everyone to consider different features , um and s if we spend that time and effort on features that we're not gonna use , maybe it's better to spend it on the f thinking more about features that we actually do want , I think we should take that as an action item for after the meeting , what we'll do is now we'll take for lunch break , 'cause w our meeting time has run out .

## Complete Meeting Transcript

Fantastic. Titanium. Expensive. I don't know, I think verbally we can we can pretty much sell. Hmm. Uh from her side, I don't think uh there's too many more questions. If you can come to the Okay, from the marketing yeah, from the marketing side, just to to give an idea what the management is looking for, I was looking for a a remote control to have a s I have a sales price of twenty-five Euro, with a production price of uh twelve and a half Euro. For what uh I think from what we're trying to find, we're tr we're looking for, I don't think that price is exactly in the market. Okay? I'll explain myself here now in the sense that uh in a in the recent surveys, uh from the ages fr from fifteen to thirty-five, eighty percent are willing to spend more money for something as fancy as trendy. Twenty-five Euros, uh that's that's a preson reasonable price. That's a market price right now. Now if we're gonna take a risk, and push this up a bit, make it more expensive, but give them added things that they don't have now, then it w it could possibly sell. Obviously the risk is there. Too expensive, they're not gonna buy. But, I think uh there's one other thing interesting two things that are interesting is that uh from the fifteen to thirty-five year-old group, which always spends more money on trendy new things, speech recognition is requested. And we're talking between seventy-five to ninety percent of this group is willing to pay for speech recognition on a remote. Obviously, we can't make a remote into a computer, but maybe simple commands. I dunno, louder, softer, on, off. That might be a possibility, even though it costs more, to be the first on the market to produce this. Thirty-five percent say they're too difficult to use. So we have to figure out a

way of making it um more user friendly. Uh fifty percent say they can't find the remote half the time. So maybe one word speech recognition commands, say remote, and there's a beep beep beep, and they can find it through, you know, ten tons of newspapers, magazines, whatever you have at home. But, in the cost that uh the management is looking for, that's not gonna be possible. But if it's trendy, if it's fancy, it's got some colour to it, if it's very easy easy to use, if it's got simple remote speech remote uh control, like I said, louder, softer, change channel, on, off, remote, it goes beep beep, I can find my my remote without spending half a day looking for it and getting all upset 'cause I can't turn the T\_V\_ on. So we're gonna have to look at it in a in this global idea, with the ideas of the industrial uh design. But, price obviously we have to talk about. Speech recognition. Mm. Because tha w with speech recognition uh th I'm not that good at that idea but th if it's a one-word recognition, 'cause I know with telephones and cars and things I've seen in the States, a friend of mine says call Mom, and it calls up Mom. 'Kay the radio can be on and everything. Because I think s with speech recognition, if uh the the remote or like the telephone it has a exact word that it has to hear. I don't think it would come through a sentence in a television. If somebody's speaking on the se the television, they're not gonna stop and say remote, okay. So I think that uh something could be designed to recognise single word Like the t like the telephone. No because I this is this is years ago in the United States where we're driving down and he said call home, and the telephone called immediately so well, that's kinda cute. From from your side uh, you're gonna have to go back the management and s be more s precise. What do they want? Uh, a risk, take a risk on the market? Something that's gonna cost more, but could very easily s make a boom in the market? Because it has to be something totally different, has to be total totally new. Something that nobody has right now. And it's gonna cost. Mm-hmm. Sure. Sure. Obviously. If the bottom line is positive. Mm. Mm. Yes. Mm. Hmm. Individual actions.

She's objecting. Oh th we s we still have Yeah. Right. Agreed. 'Kay, do you wanna open the I'm number two. That's it. I'll do the notes. Yeah, thanks. So um well I I figured uh we should um identify some user requirements, and from my experience, I wanna uh, and from research I did, uh the the device has to turn the television on and off the first time you press on the big button, you can't uh can't have like uh waffling on this point, you know. Really have It needs to be able y y have to be able to find it. Because one of the biggest problems with remote controls is finding them. So uh, I also, since we have to establish our corporate image on the basis of this new product, thought we better look at things that are popular and um ex go beyond those, and, as I said in the first meeting, um and then uh we might wanna talk eventually about the materials that are appropriate to use in uh in the construction, especially in the the uh the outside of the product so that it gives the appearance, and it is reliable, and so forth. I did a little history on uh the the uh remote controls and when they were invented and so forth, so, I guess this guy Zenith uh created the Flashmatic, which I kinda like the idea, 'cause it made me think of um um maybe the remote control made a big flash when uh you turn the T\_V\_ on and off, that might be interesting. And um so it was highly directional flash light that uh you could turn the picture on and off, and the sound on and off, and change channels c so I think um those are still requirements we have today, uh fifty years later. And uh it was really a pioneering innovation, but it was uh sensitive to the sun, so that uh it would get would start off by the you'd get it would easily cause um problems. So, uh I in addition to uh looking at the um uh the functional requir so all these devices are examples of where uh mm they represent examples that are available today which I think the one in the middle is r um really uh something to keep in mind. It'd be easy to find. And um it would uh y you'd you could throw it at things if if the T\_V\_ didn't turn on and off, you could use it for something else. And since I'm not really um Industrial Designer, I didn't really know what to do with this slide. But um I just took some

different uh schematics and I put them into this, and I guess this is what a slide might look like if you were drawing a circuit board. I don't know why um we were asked to do this. So, uh personal preferences, um I think we could uh I I'm really thinking outside the box here, and I think that we should consider perhaps having an an an a a size uh a remote control that changes in size depending on the user preference. So something that's very very flexible and inflatable and then you could shrink it. I think um it could either be you could go either one extreme, be very colourful, or you could make it clear, and um kind of blend in with things, so you didn't have to um uh have a problem with the th the decoration of the of the user's home. Um I think uh it needs to be waterproof, because uh sometimes they fall into cups and, you know, it might be out by the swimming pool or something like that. Um if you uh mi one of one of my requirements was about needs t to tell you when it's done its job or not, because half the time, I keep pushing on the remote control, and I don't know if it's actually understood my message, so I think it should give you some sort of an oral cue. And uh, course I never wanna replace the battery. So, that's those are my f preferences, and that's my presentation. Yes. Run over it with a car. Good idea. Good idea, I'll I'll uh um Yes, very good. Hmm. Titanium. Titanium would be be heavy, too, wouldn't it? No, I haven't really um I wanted feedback, I think we need to rate rank these, but we'll see what your uh personal preferences are and your thoughts. I like titanium. It's light. Uh yeah but uh who who said who said we were, you know, nobody told me how mu what our fi

nancial objective is, so um It'd be hard to inflate something ou made out of titanium though. Not fat? Not fat, huh. Might be hard to find, though. Oh, okay. Speech recognition?. D uh I'm sorry? Well, uh training is always an issue with uh commands. So um might uh we can perhaps um do it if the user is willing to spend some time in the training process, uh it could reduce th th uh the overall um cost. Not sure how. But um anyway, um I I think also that uh this might impact the battery life. And um so, maybe what we'll have to do is um add something where you can um recharge it wirelessly so that uh y you know sen send power to it. So uh or maybe uh set it out in the sun and it uh, you know, gets uh, from the light, um a a solar cell inside there so that uh you have enough uh juice to do all these fancy things. Off. Very good point. Okay, we'll find that out. Oh, it's um, seems very understandable. Clearly your research and uh and ours uh heading in the same direction, and um uh the only thing that I saw missing from uh your your research that we found was this uh ability to find the doggone thing when you need it. So uh, you know, but that's okay. That's why we're all here at the table, so that if we think of it and our research indicates certain things and um w we it's complementary. I also think that um uh th f the the feel of it is uh, when you hold it, is something that um uh was expressed more in in in in my uh design and that's logical and normal 'cause those are the parameters that an Industrial Designer's more thinking about, th th the look and the feel, and uh, you're First. Yep. Mm-hmm. Okay, so I don't have any questions. Sounds good. Do you wanna go back and look at the closing slide, maybe that would provide some guidance? Doesn't really tell us. Well it says individual actions, it says user interf so I'm supposed to do the components concept, supposed to work on the user interface concept, and you're supposed to keep watching the trends. Um and specific instructions will be sent by our our coach. I think we should do as many features as uh start with all of them right now and eliminate them later in the process, that's my suggestion. You can object if you want to I think we should take that as an action item for after the meeting, 'cause w our meeting time has run out. Somebody else has go to use this room, and, you know, we can't hang out here and talk about this, so Thank you very much. Okay uh Agnes, you can help me for the slide when okay. Okay, welcome back. I hope uh you have a fresh head and a fresh time. How t now the meeting actually we gathering here to discuss about the functional design meeting. Okay, and uh we'll issue some information from uh all of you. And it's in the, I think uh, in the sharing

folder. And uh I will invite uh the Christine and the Ed and uh Agnes to discuss about on the various subjects. So can you go to the next slide? Yeah uh the agenda of the meeting is opening. Then uh I'm going to talk about uh the project management, what I'm going to do, and uh, of course, I'm doing the project management and secretary both, okay, to take the minutes of the meeting. And there are three presentations. One is uh new project requirements. And the second one about uh decision on remote control functions. And uh finally we are closing. Uh and the meeting time will be uh forty minutes, so you have to be very quick. And I have come up with the management come with the new proposal, okay, and I have to discuss a few points on this. Uh both says new insights in the aim of your project. Uh the one is uh the teletext becomes uh outmoded, okay because if uh because of the computer systems and the new technology. So we don't need to consider really about the teletext all in our new project design. And the second one is about uh the remote control. Should be used only for the T\_V\_. That's what our uh management says. And the third point, it's very very important to establish our uh marketing or uh corpo

rate image, okay, with this new project or new product. Okay. So I will invite uh Agnes, can you go to the third slide? Okay,. So, I'll invite uh Christine to discuss about uh the functional design. Yeah, let me uh interrupt you uh if you can add other facility, other feature, like uh unbreakable. Okay, because uh especially today, you know, you have the family and the kids, okay, and the kids throw it and they they play with their remotes and. Yes. Okay, so if you can add the feature, okay, for your uh fabric whatever in your outline design okay, with unbreakable, okay, I think that will give a lot of advantage for our product, if I'm not wrong. Maybe you can uh add it in that. Okay, uh thank you Christine, and uh uh any questions or uh clarifications, or any discussion on the functional design? Yes. Yeah so Yeah the the I'm sorry because uh the last meeting we supposed to discuss about the financial thing. Uh let me go quickly, maybe if I can go back. I know the project plan and the budget. So I can close this, not sure. Was in uh S This. So let me see where is this file. This is Christine. That's yours, okay. Saving. Okay, uh I will I will send you a mail, okay? The project may be the the project aim, okay. At the end of the day, the company uh wants to make at least uh the fifty million Euro. Okay, and uh of course the price will be very reasonable on the the sales side. Okay, that maybe Eddie will talk to you about uh how much uh the price and uh what's uh how much its cost for the manufacturing and how much it's going to be we sell in the market. Okay. Then uh you can come back with your feedback. And I I have one maybe the suggestion or opinion. This remote control, okay, it can be for like universal, to use for any T\_V\_. Okay, and it will be slim, okay, and uh Not fat. Okay. Yep. But let's try it, okay, with the different uh the designs, okay, the functional designs. Okay? So any other questions? Okay. Thank you Christine for uh time being, so then uh Ed, so can you tell about Mm-hmm. Yep. Yep. Mm-hmm. Yep. So what do you think about uh the design? Do you think you can make it or uh What do you think about uh the design, uh what he was talking about of the speech recognition? Mm-hmm. Yep. Well, what I can uh suggest to you, Christine, okay, uh if you need some uh the technical feedback, or some training, okay, about uh this facility, especially for the speech recognition, I can recommend you some companies like uh Intel or I\_B\_M\_, okay, because they're already in this uh speech recognition part, okay. And uh you can maybe have some uh technical backup from them, some kind of a technical tie-up. Okay, and uh if you want, I can coordinate, okay, to get some information, okay, and uh you can uh let me know, okay, so what kind of uh the details you require okay, to add this feature in this project. I don't think it's uh the difficult. And uh we need to know how much is the timeframe you need to develop, apart from uh what today. Yep. Yes. Yes. Yes. Yep. Yeah but but end of the day, you're the sales guy, so I will come back and sit on your head because uh you are going to give your sales

projection, okay. It's uh of course it's uh good to uh tell the management how much it's cost us and how much you are going to benefit, okay. And uh, so I don't mind to convince, okay, the management to spend some more money on the project, okay, if you can make out of the money from this project. Yes, okay I don't mind to convince the the management, okay. The management says, okay, so they they don't want certain facilities, which it's already worked, okay, they want something uh new, okay. I think uh like uh speech recognit definitely they will agree, I don't think they'll say no for that, okay. And uh I hope I can convince the management on that, okay. So if you have any uh new ideas, okay, for uh your you can always come up and uh you can tell me if you need any uh s special, okay, coordination, okay, between any uh technical companies

, which you can uh hide their technology backup, okay, for your uh functional design or technical design, okay, then I am ready to do that. And uh what's your comments about uh Yeah, so you are finish, Ed, uh so I can uh Okay, I'll uh hand over to Agnes. Just gonna close this. T Uh where are you, here? Participant three. Okay, so I'll yep. Okay. Is it okay? Alri Click mm. So for anybody need uh any help, for time being, on this uh subjects, okay, so please come back to me, and uh Christine, maybe I can uh try to help you to get some uh the technical uh the companies to help you for uh make a design uh slim, okay, and to add some features, like we are talking about, the speech recognition and all. Yeah. So not really this one we are talk ab Yep. Okay, that will be great. And uh I'll send you the the minutes of meet Yeah. Okay, what we'll do is now we'll take for lunch break, okay, then uh we can discuss furthermore, okay, with our areas, and uh then we will come back again in the in the next meeting. So thanks for coming and uh I'll send you minutes of meeting, and uh please put your all information in the sharing folder so everybody can share the information. Okay? So let's go for lunch then. Thank you. Yep. Sure. No, this is the third slide. Sure. Um. You're participant s Two? Do you want the mouse, or do you want me to Mm-hmm. Do you have any preconceived ideas in terms of materials? 'Cause, for example, in the unbreakable thing, doing something plastic would be harder, whereas having something like, I dunno, steel or titanium isn't really economically viable. Yeah. Yeah. Sure, yeah. No, I just wondering whether that you had any sort of Yeah. The marketing comes out. That's Christine's. And that's mine, I think. In modified. S 'scuse me for one sec. Hmm. It seems also like with the speech recognition, yeah, it's a great feature, but if you're watching T\_V\_, there's a lot of ambient sound, and it's words. It's not just, you know, noises like something hitting. It's actual speech, so then you have to make sure that the speech recognizer is good enough to filter out the T\_V\_ speech, and the the user's speech. Otherwise, you can say remote. But if someone on the screen is saying the same thing, all of a sudden, you have someone in a movie saying off and your screen dies, because they've triggered the remote control and it's turned off your T\_V\_. So, I think if we can find a speech recognizer that can handle those types of problems, then yeah, it'd be a really good marketing gimmick. But, I think we seriously need to consider how that would impact the situation. Mm-hmm. Yeah. Yeah. Mm-hmm. Mm-hmm. Oh yeah. Yeah. No, I think it's a great idea if we can design it to suit those requirements. Yeah. Um well, I mean, maybe if I go through my presentation, you can sort of see what the user perspective is, and how it ties into the other two comments. Mm participant three. Nope, here Good. Thanks. Yeah, and that's fine. Okay. So, basically, the method that we usually use in the user interface design is that we need to look at what people like and what people don't like about existing products. So, in our case, existing remote controls. And then, what the good ideas are, and what the bad ideas are, and why they're bad and good, which isn't always as obvious. We seem to have intuitions about why things are good or things are bad, but when you look, technically, at how it works, sometimes that's not the case. Then we need to decide what functionalities we really want to

keep, 'cause that'll feed into both Ed's work and Christine's work. Um and then what the remote control should look like, obviously, once we've got a good idea of what the functionalities are. So, in terms of the functionalities that we need, you obviously need to be able to turn the T\_V\_ on and off. You need to change channels, both by directly going to a specific channel or by channel surfing. You need to be able to control the volume and then control any menus on the T\_

V\_ to regulate contrast or whatever. So, the problems that people have expressed is that there's too many buttons on remote controls, in general. The buttons it's not clear what they're supposed to do. Um often, you need to know specific button sequences to get certain functionalities done, um which you don't necessarily always remember, especially if it's a functionality that you don't use very often. And that the buttons are too small. So, here we've got two examples where here on the left-hand side, you can see a remote control that has lots and lots of buttons. The buttons, in a lot of cases, are tiny. Um they're hard to see, and okay, they're labelled, but the labels don't necessarily tell you too much. Whereas, on the other side, you have a much simpler remote control that I think basically has the minimum functionalities that are needed. And it sort of looks simpler and just less imposing when you first look at it. So, I would be inclined to go sort of towards this, in terms of design, rather than this. And if there's specific functionalities that require more buttons, then we can figure out how to do it with existing um buttons. So my personal preferences are to keep the number of buttons to a limit, or to a minimum, sorry, make frequently used buttons bigger and more strategically placed, so like the on button being really obvious one, the channel changing and the volume, and to keep the design basically sleek and simple. Which, I think ties into what Christine and Ed have both said fairly reasonably. Um so, that's pretty much it, an I don't know if you guys have any questions or Yep. Yes, that's true. Yeah. Yeah. Mm-hmm. Yeah. Yeah. Oh, that's definitely a very important factor, especially to users who are gonna be buying the thing and then using it almost on an daily basis in a lot of cases, I think. Oh Should we maybe make a decision about what features we actually want to include, 'cause we've thrown a lot of features onto the table, but do we actually want to incorporate all of them, or have we missed anything? Sure. Mm-hmm. I thought No, I I'm just thinking in terms of time, like if Yes, now I'm objecting. No, I mean, I was just thinking is it really practical to start designing something with features that we're just gonna end up throwing away? I mean, it takes a lot of time and effort for everyone to consider different features, um and s if we spend that time and effort on features that we're not gonna use, maybe it's better to spend it on the f thinking more about features that we actually do want, but I guess Sure. Yeah. Yeah. Sure. Okay.

---

# Meeting ID: 15

Data Source: Train

## Executive Summary

The Industrial Designer presented an overview of the internal components of a remote control device. He discussed energy source and material options, and suggested that using rubber and plastic would be the most versatile option. He displayed the three options for chips. The User Interface Designer discussed voice recognition with the group, and the group decided to not use it in their design. He suggested using rubber buttons because of their durability. He discussed the size of the device and the layout of the interface, and suggested that the remote be moderately sized to prevent its getting lost. The Marketing Expert expressed concern that the remote lacked enough features to be distinctive. The group had a discussion to decide on the product features. They decided to include a charging stand, to use a thin rubber casing material, to include a locator function and a scroll wheel with two channel-changing options to increase its usability. The group discussed the cost of the various components and decided to sell the device at a point between thirty-five and fifty Euros. The User Interface Designer and the Industrial Designer were instructed to construct the prototype.

## Complete Meeting Transcript

Rock and roll. So do we need to re-train Mike on how to put his mic on? Okay, can he get it all by himself this time? So I believe I can fly. Just what I needed was something exciting. Remember, I'm an old man. Thirty's really young, eh? Jose he man is. N name. I've I just love you tech guys, huh. They just Yeah y do jabber. P Yeah. I I gotta I gotta flashlight, and uh yeah but it's interesting 'cause you shake it like this. Like this. And that's on the camera. Yeah. I g I I figured you would. Yes. Yeah. It it it Uh. Uh uh to me in a marketing sense it's not it's not relative. We can we can o we can uh accentuate whatever whatever product you put in there we can find a way to accentuate it. And if you make it from that super rubber, when you drop it on the floor it can bounce right back up in your hand. You don't even need to lean down to get it. Mm-hmm yeah that's yeah that's what I see. Yeah that's what I see also. Ooh. That's right. Mm-hmm. I dunno. Trend watching I guess. Trend watching I believe. See what it looks like. It's been so long. Well I don't know what to say. When I s when I see the when I see the product I I I I don't wanna buy it. I see so many of 'em out there. There's nothing about that product that

makes me wanna choose that product over other products that are out there. Yeah yeah. Okay. Okay. Okay 'cause 'cause right now I don't have too much to say about how to market this product because we don't have a product to market yet. And uh from from talking to Mike is that we have we have uh we can market a more expensive product now. That's what I understand so, hello. And and so yeah I'm a I'm a little bit stuck right now in that what uh w what is it that I'm gonna market? Uh without special or increased marketable features I don't believe the product has a consumer demand. Uh I like the idea of of the scroll makin there are so many people making these products at this price right now. What are we gonna do to make this one special and unique? Uh well I don't yeah it's I I just see it as different. I don't say it's specially mm I don't say it's special. Uh I say that it's different I what I'm looking for as marketing is m give me something different. I give me a lower price, give me a higher price, give me some new technology, don't give me the same thing that everybody else is putting out there on the shelf it's f at the same price. I need something to market about this thing. We're we're a new firm. What i if when when we have yeah when we when we have something like the cradle or or something give that's as as a marketing standard I need something to market, to make this product unique. Yep. Mm 'kay. Just remember when I made up this report I didn't have the information that we're discussing here. And and so so uh yeah when we have a cradle, when we have some kind of design, so what I'm saying is, from my perspective, I don't have a product to market right now. Um uh my personal preference is that we make some adjustment in the cost, either lower or develop an integrated new technol technology. That's that is the next step, there's technology and then there is technology, which we're moving into the next phase. And so uh we're gonna have some new technology to enhance the marketability. Yeah uh again I'm not sold on the product because we don't have a product in my opinion yet. So I need a product. I need a product to market. And I just whatever product you guys put together, we'll find a way to market it. Tha that I'm not concerned with. If you if you give me if you give me a cut-out of what everybody else has then I need to I need to find a lower cost. Yeah wh wh what's the wh Okay now what I see with the scroll wheel is everybody has buttons. So from a marketing standpoint I have I have another door to walk through when we have something that's unique. If it creates something more complex or more expensive, then I don't know if that makes it uh a marketing necessity. But again, from a marketing perspect

ive I want as much new and different about this thing as possible because we're we're co it's a very competitive market. Mm-hmm. Yeah yeah. I think it's that's right. I think so. Mm. Yep. I think we got some exclusivity in that, you know, we got something that nobody else has right now, and and that means we can we can make some adjustments in the retail or wholesale price if we need to and it also can create it's own demand from it's uniqueness. Yeah. Yeah right now there's right now there's nothing coming out of the T\_V\_ to receive, so you know unless technology changes and information starts coming out of the a cable box or something there's no s I don't see the, I don't see the necessity of an L\_C\_D\_ either. Don't see it. Again. Well I think it's it's the more uniqueness you can bring to the product, the easier it is, I believe, for me to market. Uh again the push-buttons I I see are are everywhere. And so we can go with the same thing, but we're gonna be com competing in a in a broader market than if we go with something unique. You know the other thing I thought about was you know, do we go to something like this? Make a remote that doesn't look like a remote. It's just another it's just a an idea, and I don't know I mean what I see one of the things one of the things you brought up in an earlier presentation is, when you got children, their their stuff gets inside the circuitry, they get dirty, they get messy with drinks and stuff. This And what I keep throwing out there I just keep throwing out ideas to try to make this thing look or act or in some way identify itself as unique or different. But

you guys are the ones that have to ultimately create the product within cost. Oh okay phew. I think you gotta get into cost effectiveness. I think if you can have the base station with a locator, I think those are two very strong features, if that's something that can be integrated without a bunch of extra cost. Mm-hmm. Integrated, yeah. So it's just uh I think that's I know personally that would be a very attractive feature, is to have a uh have a button I can push to find my remote control. Or maybe you can like have a smell-o-rama, you know you push a button and it puts out a stink. You can Yeah yeah yeah yeah. Yeah. W Yeah. Oh yeah. Yeah. I think there's you know that uh there are so many people today that are that are surfing are television surfers, and I see the scroll as a great mechanism for surfing. Instead of going button-to-button you just you'd j j j j j j. I really I really think that's a really cool thing for surfing. Well there's another That's right. Yeah I think so. I think so. Now the only thing I on the interface side of it, is that I see the dilemma. But if we have the option of scrolling at any particular speed, or the option of jumping direct, okay. So I can go uh presuming I have, on my television, something that tells me what channel I'm on, I can scroll direct from channel five to channel thirty two. I know what because it's on the television. The television tells me what channel it's on when I change it. So I don't know that really that's that's gonna be a problem, 'cause the television can go automatically from channel five to channel thirty two with the push of a button. Okay? So can we can we create that kind of interface within a scroll system? You understand what I'm saying? Oh no we could read it from the television. Yeah the television can tell you. Can. Put And then. And again we have another another great marketing tool. We have about three we have three or four things here. I dunno and an maybe we maybe even have this as in-house technology. This may be something that's available through our own uh through our own services. Or we go directional up we go we go this we go this we go this way for one, we go this way for the other. Ah-ha okay. Okay, okay, well then you just have, you have a diff you have a mode switch. Yeah yeah. Well you had acknowledg

ed that we have more money for this. Didn't you say so? That's what I mean. We can increase the cost. So I don't know I don't know whether having Well I think the design and technology has to come back and say, okay to create this product we see it's gonna cost us this much for this volume, because we do have a volume target of of fifty million profit. Okay I'm I'm okay with that. I guess what I just want to me the next step is for these guys to come come in with the design proposal with the cost estimate attached, and then we have to take this to the next level. We have to find cost. Yeah, I was gonna say thirty five to fifty. Because one of the things we're marketing about this product is that this is the last one you will ever need to buy for your television. It's one of the marketing features in this. Mm-hmm. Yeah yeah. Bas th that's that's easy. That's that's not a, it's a. 'Cause we have about six, six, seven features in that alone. Under the title of uniquenesses. Well I have Is my three twenty one is the next meeting? That's that's almost uh fifty minutes. You guys can You guys you guys can uh create a All kinds of things. Thanks, yeah. Still. Thank you. I don't have any emails. This means I can go home. Oh, we all leave. Alright well we got some exciting stuff for you guys. Or not. All ready. We do. Alright. I guess I'll go first. Yeah. Component, I think. Yeah. Yep that's it. My name is. My name is name. Sorry I did this in a bit of a rush. So so here's a look inside your really old-looking remote control. Um you've got a printed a printed uh circuit board here, and you've got all these buttons which kinda press down little rubber nubbies into these little holes that activate Yeah we've all broken a remote control. So you've also got um you've got your chip here, your batteries here, and some sorta electronics. Um Well so you've got here's here's a transistor, and this amplifies your signal, um you've got the L\_E\_D\_ here on the end of the uh uh on the end of the printed circuit board. Um you've got a couple diodes here for I don't know who and whatnot. So exactly. So um we've got a i in this in this uh

drawing he uh in this example here, this is a eighteen pin um uh chip I dunno. Uh it's two double A\_ batteries. This is pretty standard remote. So here are options for our power sources. You can use a basic battery, which we've already discussed, um th our tech department also said we have the option of doing some kind of hand dynamo where maybe you crank it or something like that. I don't know if that's really I don't know we got some qu crazy guys down there in that department so You shake it. Yeah. So that's the next bullet is the um the kinetic provision of energy, so it's like that flashlight where you have to shake it. Uh we've got solar cells, which I don't think is a very good idea because um you could not use your remote at night which doesn't make a lot of sense. And finally we've got our cradle o our power cradle idea. M battery versus cradle I think is yeah. It could be fun. Yeah. Well it is it is more uh I mean it is more eco-friendly than the than the cradle 'cause you're still using power off the grid with the cradle. So um our case design. We have uh choices in materials and choices in the general shapes that we can do. Our material choices are a plastic latex um ty or plastic, a rubber latex type thing, uh wood, or titanium. If we go with titanium we're gonna be uh limited in the amount of shapes we can do because it's tough to shape the titanium, and uh Yeah pers I think wood i I I can't see anybody wanting to use a wooden remote, it's just anti-technology really, you know. Right. And what we may be able to do, and I think this might be the best option is to combine some a couple of these. Um my recommendation personally would be to do some kind of a plastic inner shell with a like a rubber outer shell, to make it um to mak uh like a thick plastic inner shell and a t um kind of

a to have that rubber outer shell to make it more durable, and also maybe i I think it feels a little better than the plastic. Yeah um Yeah. The advantages of working with plastic and rubber is w we we'll have a lot more um options just in terms of shape because you can extrude plastic in basically any shape you want. So um and then we can cover you know the breakable bits with rubber yeah so um But basically these are curved and double-curved I I believe that the tech department, in their um in their message to me, that they were referring to the number of th curves in the bottom. I have no idea exactly what they're talking about, but that's what they told me, uncurved, flat, curved, or double-curved. I would guess this like this pen would be kinda like a double-curved, where it's curved on m m multiple axes, right? I think curved means just curved in one axis and double-curved is curved in two axes or surfaces. I have no idea. Oh okay oh like a wave, okay. Alright that makes sense okay. Um okay, with the interface we have the following options, we can u we can use push buttons, we can use a scroll wheel with an integrated push button, and L\_C\_D\_ display, or multiple scrolling wheels. Um so these are all options that the user interface guy can uh has at his disposal to put together a user interface. For electronics, we have these very technical um descriptions here. A simple chip, which is the least expensive, but I have no numbers to give you, a regular chip, which is like the medium porridge the medium expense uh Yes the difference is, with a simple chip a simple chip will operate oh why doesn't this scroll up? Previous previous, okay. A simple chip is required to operate push buttons. Um an advanced chip is required to to operate um the L\_C\_D\_ display, and it didn't say specifically, but I I have a hunch that a regular chip is gonna be the scroll wheel and the multiple scroll wheels. So but yeah. That's the end of my presentation. I think No. If the T\_V\_ is working, yeah. That's just I mean it'll if somebody says up in the middle of a television show, it's gonna change the channel. So Well then why don't you just press the up button? Even still there's gonna be interf th there's there still will be interference from the T\_V\_. It might not be it might not be completely confusing, but I think you'll still y it's still I don't think it's practical at all. I think it's a bad idea frankly. That I would believe. Mm-hmm. That's not a scroll wheel. Right. Instead of play, stop, rewind, and fast forward there, that's up, down, louder, and quieter. Trend watching has a later date there. Are you talking about the picture? That's not

our that's not our b design, that's just a that's just something he a a graphic he used to show you the layout of what the layout of the buttons might be like. What's special and unique about a scroll? Well right I think the two big th points that we have so far are the having the cradle and also having uh the um the actual design of the uh case itself having like this like rubber shell maybe with a plastic interior, having it look really nice um and also be really durable. Right yeah. Yeah. Well let's get a product then. Well my question is what would the scroll wheel do? Function-wise, what does that do that Yeah. Well it's it's just another way to do the exact same thing that the buttons do. Yeah. Th they are gonna be more expensive, but on the other hand, I mean, it I mean it is an alternative if if you think that's gonna sell some some uh you know if if we're gonna make up the extra cost by extra sales I think maybe it's worth it to do it, but I mean I would just use if I was gonna do this I would just use the scroll wheel for s channels up and channels down. I don't think volume or do you think volume would be No we can we can do multiple scroll wheels but Mm-hmm. Yeah. Mm-hmm. I'm thinking yeah something like kinda almost like these pens, you know, where there's you have plastic bits and then it's

not really rubber but just kinda like a fused the plastic with rubber on the outside. Well no ma yeah maybe a bit more then th is on here but ju just as a kind of an inspiration, these pens I think are are kind of Or from from my perspective I think L\_C\_D\_ is a mistake because this is a universal remote and all you're doing I mean it's you're not gonna get any information back from the television, so the only information you can display on this remote is what channel you just sent it at last and there's just not a lot of information, you know, there. It receives no information. So I I don't see any reason for having an L\_C\_D\_ 'cause it's an increased cost. Unless you can think of something interesting to do with it. Right. Well we have to I think for me it's still not exactly clear exactly what the inter user interface is gonna be. There's the scroll wheel, in or out? What do you guys like in the user interface? Well I dunno about like the flip-phone idea, because I think, as far as durability th it's not a big well maybe when it's closed. Mm-hmm. Mm-hmm. Yeah. Well The The locator's gonna require a radio transmitter, which will Um we're probably gonna have to go with a like a medium chip, s I would imagine. But we I we will need a receiver, an antenna. Yeah. It should be a really simple signal though so That's true yeah. Oh yeah yeah. It'll be really cheap. So the scroll wheel, in or out? For me I think the scroll wheel actually might not be so bad. I don't know exactly what the increased cost is gonna be, but I think he does have a point, i it might push somebody over the edge when they're looking at our at our remote versus something else, when they see this one has a scroll wheel to go up and down on the channels. I think it might be kinda neat to be able to do it like that. Sure. Well I think wh what it would be is like like the m like this, where it's maybe you know a digital wheel, right, where it's where it's quantized into you know certain That was that was my my intuition of what the scroll wheel would be. It's just it's basically it it's just a f look and feel thing. It has the same exact functionality as two buttons. Yeah. Now just just so you know though uh you did bring up a point which is very valid, is a lot of T\_V\_s won't re the T\_V\_s won't respond exactly the same. Some of them are gonna be kinda slow switching, so you may like queue up like fifteen channel changes, and it'll be like flip, flip, flip. But Right. Yeah it just might be frustrating where you can't make it go as fast as you want, but I think once people get used to it I I do like the idea of the scroll wheel though. I think I know what you might be getting at, or or Well, what about this what about if you can programme in your favourite channels into this scroll wheel and you can just like roll through your favourite channels, and it c it Why? It'll tell you when you flip the channel on the T\_V\_. Yeah. Well you just it's one extra button. You say programme start, and then type in 'cause you still have the typing you know you'll still have the keypad where you can type 'em in manually. So programme start, zero, one, enter, zero, five, enter, thirty eight, enter, programme end.

Mm-hmm. Mm-hmm. Mm-hmm. Oh well we also have to determine in some manner how to switch between modes, between going through your favourites list and just hitting up one, up two. No because you wanna be able to go up and down through the channels. Right. I think we'll need a we'll need a mode switch, but then if we have a mode switch we're gonna need some kinda indicator to which, an L\_E\_ an L\_E\_D\_ okay. Okay. Okay. Just so you know I think I mean it was my understanding that before we were gonna stay in the mid-market range. It seems we're kind of approaching a higher-end range. I wanna make sure everybody's okay with that. Okay. I just wanna make sure everybody's on board with it. So Right. Well y yeah. Let's let's try and think now, how much would you pay for with all thes

e features how much would you pay if you went to the store, and you were in the market f to replace your T\_V\_ remote, how much would you pay for that? I'm just asking you. If Then you could probably afford this. Oh no no. I would say thirty five to forty. Okay. Right. With a cradle, radio transmitters, and back-lit buttons. And it's gonna look sexy. Or not. It might look like clay. Probably. We'll let you know when we're done, if we can go earlier. Yeah. I don't think so. If we have any questions we'll just email you I guess. Afternoon guys. It's gonna be. Oh. 'Kay. We may do. I dunno, I'm feeling like a big boy. 'Kay, ready to go? 'Kay so we've got our conceptual design meeting. Hopefully we've all got exciting ideas now. Uh k exciting ideas. 'Kay so here's our agenda our agenda. Um I'm gonna open. I'm gonna talk for a bit about what we're gonna do. I'm gonna take some notes. We're gonna all do a presentation, and then hopefully we're gonna make some decisions now. Yep. Well when I say hopefully, we have to. So I'm gonna let you guys talk before we make decisions. And does anyone really want to go first? You p two? What's Components design. Your name is name? Huh hi name. Right. We've all broke a remote control ri um s yeah. You press this and it does th I dunno who and whatnot. 'Kay. Okay. 'Kay. Mm 'kay. Okay so we basically have battery versus cradle here? Okay. So we have battery versus cradle It's actually a novel thing because you could sell it a as a novelty, just to be actually serious for a minute here, you could Mm. Hmm. Wood wood would ge would give us a little bit of a marketing niche, wouldn't it. Nah. Okay. Hmm. Okay. 'Kay. Do you get a good grip on the rubber? Yeah okay. Okay. Okay. Okay. I think it might mean something like that sorta shape because a double curve rather than a yeah that's what. Okay. D do we have actually any concept of what the difference is between a simple chip and an advanced chip? Okay. Okay. Yeah that makes sense. So presentation from I guess design would go best. Next. Technical functions or interface concept? Yeah that's it. Yes, but it has your name on it. But what if you actually had to press a button to make it recognize? So if you pressed it and went, up? Man yeah. But if it's just one thing with a button that you can just go Up. Yeah, okay. Okay. You guys know your stuff. Mm. So we're suggesting doing a sorta scroll wheel thing for the volume? Nah. Oh okay okay. I see. Uh, okay. Okay. 'Kay. So on to Y functional requirements or trend watching? forty six nineteen fifty seven. Yep. Mm. Upper management said yes. Uh e excuse that, that's a bit of spam. It's cool. I'd I'd say though that we if we did make the decision to go with the cradle though, the then we have that as well, but wi with a similar Mm. Course. Yeah 'cause that's. Mm. Mm 'kay. So now So our big questions here really are cradle or not cradle? Do we go basic or do we go for features? Uh d does anyone really wanna do anything with the scroll wheel or should we ditch that off-hand first? Oh but that was in your presentation so wh what would you imagine it doing? Mm 'kay. Yeah. What I understand about scroll wheels is they're they're quite expensive to to make. So I d Well I d I like the idea of basically focusing the my personal preference is focusing the p the product on the idea of the uh the case the the uh dock to put it in to to charge it. We can target like environmentally friendly ideas, that sorta things. It s i m makes it easy to market, it's easy to differentiate the product, yeah so. And if we we

keep the rest in a format that is durable because the whole product's gonna need to be more durable than thus because you're not going to be ditching it as often. It's gonna need to be more expensive because of the cradle. So if we can market it in terms of that and yeah well So our big decision then is like how do we do um like we have to decide on the details and we have to decide on well not exactly the details

, but do we have uh What type of casing? I personally like what you were saying about the plastic with the rubber. Okay. Just a very thin sorta sheet for a grip, sorta thing or for Okay. So then if we do do we want to do anything more basic with the uh more advanced with the user interface in terms of do we want to go for um buttons, or do we want if we're ditching the scroll wheels do we want to go L\_C\_D\_? Do we want to give do we want to have anything else on it? Okay. Okay so the question is now I guess we need to decide on well you guys basically have to now go and figure out the details of this thing. So, what we need to know in terms of marketing and uh project management are are there any other questions that we need to answer now before you guys can go and build this? What what overall things have we not decided on? I think maybe in terms of marketing, is that gonna make enough of a difference to justify the cost? Yeah and I guess the question that that you're being asked right now is whether is the dock enough of a unique feature to be able to go out and sell that as a very different product, or do we really need the scroll wheel as well? Because the scroll wheel comes at quite a cost. That's gonna need a better chip as well? And it's presumably gonna need a little speaker in it or something like that as well to beep. But I guess a little tiny speaker is gonna be quite cheap, it's not gonna need quality, is it? It's Makes your living room more fresh as you watch. Okay we're doing well for time here. Um we've got about another ten minutes. I think that uh Mm per my personal preference is out. I don't think the cost is justified for a little bit more uniqueness when we already have that, and I don't think it's obvious and natural how it would be used. Mm. But then that that surely depends a little on the T\_V\_ because some T\_V\_s are quite slow at changing channels from like so if you've got a scroll wheel and you scroll scroll it really really slowly just so that you're actually keeping in pace with the T\_V\_'s ability to to change channels. Or do you have to go through and you wait for it? You scroll it a bunch of times and you wait for it to Mm. Uh I see I see. That's where you Ah I see I see what you're talking about now. Okay. Yeah if you're just sitting there going That's kinda cool actually. I like that. Well not necessarily. You could basically make it so that it'll I mean it's just gonna be sending a signal to the T\_V\_ yeah the T\_V\_'s go so if you send about five flip channels, if you did that it's gonna flip once. If you do that. Other than click click click. Yeah. And if we're marketing it as a high niche product, then we're gonna be selling it to people who are buying good T\_V\_s as well, yeah, presumably. Primarily. Mm-hmm. Mm-hmm. Oh I see so if maybe if we had an L\_C\_D\_ up the top that just did a number on it, right? And then it that basically Mm. Well that's quite cool. You'd need a display on the thing. Oh yeah yeah no I see what you're talking about. Yeah that's kinda cool. How would you program it though? Okay okay. Okay and yeah and that just basically flips between it and it'll go it sends out zero, five, and then thirty six, and then zero, one again. Yeah that's kinda cool. I like that. That's not gonna be too expensive because that's gonna be you're gonna be able to nab that off of computer mouse manufacturers really. You could basically come up with a partnership to be able to produce that quite cheaply. Might be, but that's not gonna be such a costly feature. The problem we're gonna have is making it robust. Making it last. So if there's a button for each type. Yeah people are gonna have their favourite sorta, whether they do that or whether they Yeah yeah the mode switch. Just the lights behind the buttons. You could have back-lit buttons maybe. Would that work? Is that okay we have five minutes. So right details that we've ta

liked about here are that we want a scroll wheel. We want a mode indicator. We want back-lit buttons. And if we're making back-lit buttons period, do we want that just for the mode indicator or maybe to indicate what button you're pressing at the time, so that you know if it's actually pressed or not. I've seen some remotes do that. I think we are yeah. Yeah well we don't have it's not that we have more money, we can push up the the price. Yeah. 'Kay. Yeah. So we really need to be sure as to what we can push the cost up to, though we haven't got to a stage where we're ready to pin down the price of components. But I'd say what sorta price are we looking to be able to sell something like that, and what sorta price can we make it for? Yeah no I I think that's where we really should be more flexible than anything else because as we said in the last meeting, our management is really looking for us to push our brand. We're entering a new market here, so I think the the profit expectation for this one product is maybe not as important as being able to But th what's our ballpark as to what we'd be able to sell something like this for? But you've gotta think who our target market is because I I'm not our target market. I'm a student, but on the other hand I would think, mm with my Project Manager salary, I would think yeah I could probably afford this uh would I buy it? Maybe. If I had a cool new T\_V\_ and this was r looking really slick and it had the dock and it had the scroll wheel, which I think's a really cool idea, that would sell me on it a little. Then maybe you know. I do I don't think I'd go over a hundred Euro certainly, that would be way too much, but the I would be happy paying over forty for it, I guess, but not much 'Kay. Thirty five to fifty Euros is our sales bracket okay. So the question is what we ca we make it for. Mm. That's why the scroll needs to be really robust. Yep. Okay. The next meeting starts in thirty minutes, although does it? It starts at three twenty one, the next meeting. So we've got more than a thirty minutes. Um we've got more like fifty. The the ne next meeting is three twenty one yeah. Yeah that is. Uh they've they've changed the times from the presentations. Okay so you guys will be getting your modelling done now and uh Okay are there any other questions with regards to what this thing's gonna do, look like, how it's gonna work that need to be addressed before we really look at this in a lot of detail? Okay. Okay. This one was quite easy. Always the optimist. 'Kay thanks guys. Think s Mm. Pro Probably not, 'cause he's 'S been listening to too much. He's getting retarded. Yay. Or not. Yeah. Apparently I'm old as well. Presented by name. My name is Inigo Montoya. You killed my father. Prepare to die. Yeah there's a thingy and a dingy and Nah. I wanna change that. I like the kinetic. Oh interface concept. Very long presentation. Well that doesn't bo bode well for it for it tats as well. Um so, somehow that thing's too big, but um okay um our uh manufacturing division wanted the speech recognition. They say they could put it to work but um we don't think so. No. It it it you'll be you know be affected by the by the other speech and Yeah and and fighting for the remote would not be fun anymore, and I think that's one of the things we wanna keep. That kinda would r d yeah. That would kind of lose it. Yeah so um taking that away, our uh the the the rubber but rubber buttons are the more reliable it's the the ones that would al would allow us to to market our product as being you know less prone to damage and more resistant to things like spillage of liquids over it or you know mistreat misuses as it happens to remote controls. Um as for the point that we making about losing it. Well, we wanna small r remote control one side because uh we want it to be cool and uh designed, but um apparently um market shows that bigger s bigger um remotes get less lost, about But um yeah I think we we need to compromise

between those two and somehow we'll do that. Somehow. Um so the the what I would propose is something more or less in the uh direction of what is to yo the right of that slide uh but without with a l a less complicated um design, so the numbers, the volume control, and channel control, and teletext access. Uh the volume and channel control can just become those the the four button array as in if it

was a round dial. And um if you just think about it as the one to the right but with the numbers and the four buttons plus maybe a centre one with teletext. Ye no it's not i i it's just four buttons that are on a cross, so that you ba basically can control all of the important tasks from that alone. Yeah um yeah so I think we w we go for something mid-sized, so something looks good and uh is not too prone to get lost. That be it.. But would we I dunno. I'll bet first in volume maybe. I dunno. It's only a T\_V\_. Hmm. Mm-hmm. No it's just different. Maybe not. S Yeah. Yeah I think we have like and it's not very usable and it will bring down the robustness of the whole thing, 'cause it's it it breaks down easier. Mm-hmm. Yep. Yeah. Yeah. Okay so we'll come up with something between thirty five and fifty that is rug rubber, robust, with scroll wheel, with the new facilities of the scroll wheel like favourite stuff, favourite channels, and and with a cradle, and yeah and the locator. Or not. Okay so you can market pe depending on that? Cool. Hmm. Yeah I think it pretty much everything's covered. Coulda been worse. Yes I am.

## Executive Summary

Right um this is our conceptual design meeting , I think we're slightly ahead of ourselves This is where we talk about um properties , materials , user-interface and trend-watching . the minutes from the last time . Um we had a couple of um changes in our plans in that we couldn't use teletext , it wasn't gonna be a control for everything um and that we had to incorporate the image of the company into it somehow . we have decided on a leaving out the voice recognition , we've decided on there being a flip design and um a different shape from what's normal . We were thinking a shell , but something along those lines , and we were gonna think about the port and an alarm for getting it lost , and so this feedback from the marketing department is really about trend watching . Um the methods we used to decide on uh current trends and so on , market trends , were that we did our traditional uh our usual market research study uh with a hundred subjects Also with our company um being forerunners in uh putting fashion into technology , we also looked at a fashion update um using our consultants on fashion and design in Paris and Milan . Uh so the general findings from that was uh in the market trends the most important aspect for remote controls were people want a fancy look and feel , rather than the the current functional look and feel of remote controls . They also also want a remote control to be technologically innovative , and of course , as we predicted , that it should be easy to use . Now I should point out that the first of those findings , fancy look and feel , is the most important , is twice as important as the second , technologically innovative , which is in turn twice as important as being easy to use . um we found from our um consultants in Paris and Milan who des attended all the design and fashion fairs there , that fruit and vegetables are going to be the theme for clothes , shoes and furniture . There also seems to be um a trend towards a spongy feel to materials , Um this is uh all about the design of the actual components and the availability of the components we have in stock at the moment . 'cause some of the things that we looked at last time aren't un unfortunately aren't available . This is uh the chip called the T\_A\_ double one eight three five which is what's used in pretty much every remote control 'cause it sends out standard signals , based on your input Um and then we we're loo looking into battery options . There's um actually no rechargeable option available , I saw the um the standard double A\_ and triple A\_ which we thought were a bit bit too bulky at the moment , dynamo charging , I thought that that might be a bit silly to be to be honest , So you wind up your remote control before you use it . like the the solar charging , 'cause most people have the light on in the room anyway so they

could get when when you got T\_V\_ . I'm pretty sure that solar is from the sun . But I I think I think the the next one's the best anyway . The the kinetic charging which is like you get it in r you get it in wrist watches I mean the amount the amount of probably moving around you'd be doing all the time would would charge it up , it like it runs for long time ? well I do I d I'm not entirely sure how long it would last but I've never seen one run out . referring back to solar charging , is that compatible with um standard batteries ? Ye yeah I think I th uh g y you could have a dual um power thing but the the thing with the solar cells is you would need to put them on the case on a calculator they they're qui they're quite big and they all they all look i identical . Yeah the normal batteries would be the cheapest W w which one would last the longest , because we don't want customers to be like you know charging like a mobile phone every day . 'Cause if we're doing the kinetic thing Shouldn't we do some market research on that first before we add it in It's not something that's come up in any of our uh focus groups and market research , But it's something to put on the side to think about maybe . most current remotes use this silicone uh P\_C\_B\_ board which pr printed circuit board , the thing about is um they they can be as big or as small as you want them to be Now what I was thinking about that was 'cause sometimes when y when you have these things , they've got little lights on behind the buttons , so you can see what all the buttons are , but you could you could have lights behind the buttons Um , the case material , I've a been sent what the factory can actually give us , there's the plastic which I think we were gonna go for anyway as the main case case housing well you could go for wood but I think it would be a bit impractical . Titanium um very expensive just to process , so perhaps uh some something made of rubber , If you go for titanium they can only do a standard box shape , whereas if you come to plastic they can they can be a little more they can they can do sort of curved shapes . yeah and second question is like , a mobile you can change the cover , So in this case if you're looking at like a customer can change the colour like from green , parrot green to chilli red or something like that . I was just wondering if we make the basic mould out of plastic but have like a rubber cover that goes over , So instead of the fascia that comes off being plastic , the fascia that comes off would be the rubber , Well that's been really popular with mobile phones so I don't see why not . but I thought that an L\_C\_D\_ type of screen the problem with it basically is that it's flat and so you can't do lots of curve curved things with it , I don't see why the curved thing is a problem , if we for example had a shell , once we open that You could have a flat screen inside , yeah , w or we could have rubber buttons which are made of this material which is anti-R\_S\_I\_ . I think it would be good to have a contrast between , if the whole thing is gonna be this rubber thing it would be good to open it up and see something quite fancy looking inside . Is it possible , just as an option , when we open it up , people can use their fingers to press the button , or we have inside like a small pointer thing when people want to . but I I think they could get a bit easily lost , Is it possible that when we open our flip-top shell it's a little compact mirror and when you press a button it then goes onto the phone display th uh the remote control display thing . We're marketing to guys as much as we are to women . you were sitting watching T\_V\_ are you gonna want to sort of open it and say oh shit I should go and have a shower and do my hair before I put the T\_ we are going to have m maybe a G\_ G\_U\_I\_ interface in the f in the middle of the flip-top we just took the input from the previous meeting , especially from the marketing and industrial design , to check on the customer needs and feasibility . the picture here shows one of the standard models offered by competitors here . So you generally see rectangular shape , very monotonous kind of designs here . And uh second thing is there's too

much of confusion here . basically which is what we do in computer , have icons or touch pad or whatever , so for on the simpler board , on the top we have this button , rubber buttons , to keep frequently changing the channels . Can we swap that round so that the ones that we use all the time are on the bottom part ? So the findings are too many cluttered buttons . Repetition of certain buttons which I already explained , Okay we had a latest finding of voice recognition , there was a mail which mentions that our division has developed a new speech recognition feature . We have to check into the financial feasibility whether we can incorporate it this at a low cost , So it could be like , where is the remote , and the remote answers I am here . so I wouldn't say the design should be like a fruit , but yeah we can take inspiration from fruit colours , like the vibrant colours , uh red chilli uh I think most of the users would now be well acquainted with this central pattern , here , so we we we would not change that particular pattern I'm not sure how long we've got left , but we need to make a decision about the things we've discussed . Do we agree on the battery ? The kinetic . so we could incorporate voice recognition for the finding it . Um , that means that there's no function for the port , I think the only pitfall that we would have would be how much it's going to cost if that means we have to cut down somewhere else , The LCD's not cheap . Maybe we could start with the black and white . did we decide on double A\_ or triple A\_ batteries ? the kinetic ones come with um a sort of watch a battery that goes in a watch . The inside components is pretty standardised across the board isn't it ? Yeah the well I think we're going for the LCD\_ on that one , on the buttons , On the bottom we were gonna have the rubber , the rubber ones , Um , okay on we've got the flip the flip-screen , the top one is gonna be the LCD\_ and the bottom one is gonna be the rubberised buttons . For the body design I think plastic , so we decided on a rubber casing for the plastic shell , a variety of designs , we're not gonna try and make it actually a vegetable or fruit design or anything else , like a shell that we discussed , um the fact the material that we would be using would be cheap , so we could make it red , we could make it um psychedelic , This would definitely be different enough , I just wondered if anybody could come up with something even more you could have um a plain black one , you could have sparkly pink glittery ones for your little So we can if financially voice recognition is not feasible we could go for a whistle . And incorporating the company logo ? 'Cause I took it from the feedback you gave in the last meeting from your report , it's not just a case of having a little R\_R\_ hidden somewhere , they do want it to be obvious that it's our product I think you just address that with um advertising . Obviously it'll have a logo on it just like everything , The point is that it's got to stand out somehow differently I know at the last meeting we spoke about a beeper , have we just rejected that in favour of voice recognition then ? Yeah , depending on the expense of it . Right I'm going to wrap it up there . it says , closing we have forty minutes so I think we've probably got about that time before we come back .

## Complete Meeting Transcript

Oops. Mm. After lunch. Yeah. Mm-hmm. Mm-hmm. 'Kay. Yep. 'Kay. Yep. Fine. It's okay with me. Yep. Regarding those sizes, which one you think will be light because we have to take into consideration

size also, so maybe a standard triple A\_ might take lesser space or and dynamo might take more space. Uh Right. Night. And are these like uh what are the life of the kinetic battery, it like it runs for long time? Mm-hmm. Okay. We c Solar would be slightly expensive. It's twelve point f Another question is like sorry. W w which one would last the longest, because we don't want customers to be like you know charging like a mobile phone every day. A remote control, like, so we have to s look at the life also. Okay. So Mm-hmm. Okay. Second thing is yeah and second question is like, a mobile you can change the cover, you call it a skin or whatever. So in this case if you're looking at like a customer can change the colour like from green, parrot green to chilli red or something like that. So is that feature available in like uh titanium, or it's like only specific to plastic or Mm-hmm. Yeah. Something like Alright. That could be a good idea. It could it would be comfortable to hold on also. Sorry I didn't get the last part, you're talking of Just what you said I I didn't get the uh meaning of it completely, you're saying like Uh-huh. Okay. 'Kay. Absolutely, f for somebody who very often, if he would a person who switches channels very often or does use a particular function very often will find it very irritating to use a and he might spoil the touch-pad very fast compared to a button like, if you keep punching with an pointer or whatever. And just one small question before like you are, regarding the circuit, since we are hav having a flip-top, we can customise the two circuits for different type of buttons like we are keeping the standard buttons on the top and the more complex buttons under this thing, so we can divide the circuit like you know. Mm-hmm. Okay. Okay. Okay, uh would like to share something which I did here. First thing is uh basically on design we just took the input from the previous meeting, especially from the marketing and industrial design, to check on the customer needs and feasibility. Second is we checked into competitors, the picture here shows one of the standard models offered by competitors here. So y you generally see there's not much of variety and like marketing team said uh, people need trendy, they are bored of black and white. So you generally see rectangular shape, very monotonous kind of designs here. And uh second thing is there's too much of confusion here. No particular remote is standard. Like, some some people have a Here you see this? This is on a I I found th that uh only common feature is the ch uh channel control and uh volume control, rest other buttons, they are in a very disorganized and they are not consistent th with other models and all. Okay, and second as already discussed with William, we are going to have m maybe a G\_ G\_U\_I\_ interface in the f in the middle of the flip-top and g graphic user interface basically which is what we d do in computer, have icons or touch pad or whatever, which is Like you have on a I uh icons or something y you have is a good example of G\_U\_I\_ graphic user interface. So basically not point or click Press any particular device, he just has to click on that particular icon to simplify. And on the top m repetitive buttons which are like volume or channel changing and all could be on the pointing device, that means the use of button. So he need not use a pointer to keep changing the channel if a person is frequent surfer. So we are having a combination of boards, so f on the s simpler board, on the top we have this button, rubber buttons, to keep frequently changing the channels. But Mm-hmm. Okay and you mean to the And the lower distance. Oh f perfect. So the findings are too many cluttered buttons. Repetition of certain but buttons which I already exp

lained, example the volume and channel control buttons. All are confusing and in inconsistent. Okay we had a latest finding of voice recognition, there was a mail which mentions that our division has developed a new speech recognition s feature. We have to check into the for financial f feasibility whether we can incorporate it this at a low cost, but for like we had g um s response from the customers that they would like to have the feature of finding it. So it could be like, where is the remote, and the remote answers I am here. Some kind of thing or it gives a b bleep sound or some kind of

sound and if this can be incorporated this would be more uh you can say trendy also? And technologically innovative also. So we we can check into the financial feasibility of incorporating this. My personal preferences would be like, as already uh marketing department, they want something to do with fruit so I wouldn't say the design should be like a fruit, but yeah we can take inspiration from fruit colours, like the vibrant colours, uh red chilli uh tomato red or whatever and second thing is cer certain standard buttons we should have, like for example, i if you see the previous slide uh I think most of the users would now be well acquainted with this cer central pattern, here, so we we we would not change h that particular pattern because i this is the most consistent thing in all remote controls. This is central one, the one you yeah volume and channel. So keep that m that standardised because that's the most common feature across all models, if you look at all the models, it's here. This and voice recognition. The kinetic. Mm-hmm. Maybe we could start with the black and white. That that way we could upgrade later. Mm. Mm. Yeah. And for the sorry. For the body design I think plastic, uh w yeah we could use the body, for the inside and uh rubber as a padding or for the grip, something like to add to the design. Plast right. It's Uh I it's different. Right. Acupressure, you could talk of acupressures. And finally the body should be retouchable, may maybe ch you can change the body or the case casing the case outside, it should be moulded it with the design in such a way you can change it every time. Okay. The rubber. Fine. Yeah. Fine, uh we were talking of voice recognition also because that we are not for how to look it uh remote control if it's lost. So, are we looking at voice? Or maybe like uh William was suggesting in the last thing some devices you put on key chains. For I yeah, the whistle. So we can if financially voice recognition is not feasible we could go for a whistle. Yep. Uh sorry I didn't mention this, but we'll be incorporating in the design. Fine. Mm-hmm. Yeah. Again a questionnaire huh? I think we are pretty going in a clear direction now. Yeah, yeah I was getting that impression as well. Etcetera. Yeah. Yeah. Yeah, okay. That screwed in? Yeah. 'Kay, Okay. Um this is uh all about the design of the actual components and the availability of the components we have in stock at the moment. Okay, first uh the Into the method. The the main idea of the whole thing is just so you sh you just press buttons and it should activate things on the T\_V\_ and we discussed last meeting that it should be easy to find. Um also in this study I've looked into the availability of some of the materials, 'cause some of the things that we looked at last time aren't un unfortunately aren't available. Um, findings, I've got my nice little picture there. This is uh the chip called the T\_A\_ double one eight three five which is what's used in pretty much every remote control 'cause it sends out standard signals, based on your input and um it's pretty much used for all all T\_V\_ remotes at the moment. Um and then we we're loo looking into battery options. There's um actually no rechargeable option available, so we I saw the um the standard double A\_ and triple A\_ which we thought were a bit bit too bulky at the moment, dynamo charging, I thought that

that might be a bit silly to be to be honest, people won't it's it's basically like wind-up radio. So you wind up your remote control before you use it. It might You Yeah, yeah, oh yeah I presu you wouldn't have to wind it for very long, but I don't I don't think it's really sort of necessary when you th you think of the next two options, like the the solar charging, 'cause most people have the light on in the room anyway so they could get when when you got T\_V\_. No. Is it? Alright i Yeah it would the d yeah the dynamo would take more space 'cause you actually need a physical sort of handle to wind up. Yeah, okay. But Yeah and most people most people also watch T\_V\_ in the in the night anyway. But I I think I think the the next one's the best anyway. The the kinetic charging which is like you get it in r you get it in wrist watches and you d you don't even notice it. I mean the amount the amount of probably moving around you'd be doing all the time would would charge it up, I don't think you'd ever need to actually physically

start shaking it up to make it work. Um yeah it's it charges into um some form of it's a smaller cell which it charges into and uh the size sort of a watch a watch battery, 'cause they use them quite frequently in watches. And that'll that would I would last for um well I do I d I'm not entirely sure how long it would last but I've never seen one run out. Yeah. Yeah and Yeah but then again I I think it is because if you think about it, the watch, although it's only a tiny amount it's it's um it's always moving for the whole day and they don't run out over night when you leave them on the side. And th for the same the same reason, you're only using it for a v incredibly short amount of time just to send the signal and then you're finished with it and you put it no no I do I don't think the the draw on it would be Mm. Ye yeah I think I th uh g y you could have a dual um power thing but the the thing with the solar cells is you would need to put them on the case and they because, if you lie on a calculator they they're qui they're quite big and they all they all look i identical. They're they're expensive, they don't Yeah the normal batteries would be the cheapest I'd presume then it would actually be the the solar charging ones, um but the It's i I think they're not very resistant to dropping, 'cause if you drop stuff yeah if you if you have y the size you'd need to charge a remote wouldn't be that big but I mean if remotes always get thrown around and stuff, so. Y I think yeah, practically. I mean calculators you don't really throw around a lot whereas remotes you do, they can t Yeah they do, they yeah they've got dual things, but they're the batteries are smaller I think. Mm. W m yeah so the Yeah the the s if you if you had something du uh using the standard batteries and the solar charging, um, I don't think you'd I think the it would d well you know how long the standard double A\_s would last in or triple A\_s would last. Yeah I think i I think it would, yeah. Yeah. Yeah. Yeah. Yeah. Okay. Okay, well I'll move on. Um, my second part of my findings uh the mo most current remotes use this silicone uh P\_C\_B\_ board which pr printed circuit board, which basically has these contacts that are really close together and then when you press down on the rubber button, it'll connect the circuit and each each switch is connected to two uh different legs on the chip and so sends a different message and that then uh gets translated by the chip into a code and then it's fired out of this L\_E\_D\_ in the sequence of I on and off bursts. Well well this the thi the thing about is um they they can be as big or as small as you want them to be because you can you can print circuit board like that that it's it's simply spaced like that so you can have fit the n the size of the nine buttons in. If you if you see how thin the tracks are, you could you could s you could put them virtually right next to each other and have a

much smaller switch on each one, if you if you wanted to but um the there is an option to do to do it like that, or you could have some sort of array of switches which I'll speak about in the next bit so that And then to uh yeah, so to conserve battery life the remote should be in a standby mode no while not being used. Now what I was thinking about that was 'cause sometimes when y when you have these things, they've got little lights on behind the buttons, so you can see what all the buttons are, like on a mobile phone, they do it more often than on a than on a T\_V\_ remote, but you could you could have lights behind the buttons and um after like five or ten seconds of not being used I'd have that turned off, if we decided to go for buttons that could light up. Um, the case material, I've a been sent what the factory can actually give us, the there's the plastic which I think we were gonna go for anyway as the main case case housing and the the main problems with the well you could go for wood but I think it would be a bit impractical. Titanium um very expensive just to process, which to make it is expensive, and rubber, well you're saying that people like this uh spongy feel this year, so perhaps uh some something made of rubber, but I was thinking more of the buttons, because the buttons which they've they've said that they've they've put across are what is used in some stress ball manufacture and it's meant to be anti R\_S\_I\_. I'm no I'm not sure how that would work because surely your fingers would still be moving

over the short distances but that's what they said. Um the problem with the casing is that uh there's quite um there's quite a few design restrictions that they've got on the shape of the case. If you go for titanium they can only do a standard box shape, whereas if you come to plastic they can they can be a little more they can they can do sort of curved shapes. But whether whether or not because we'd have it in two separate units for the flip phone. Yeah. Yeah I th Uh. Yeah in in titanium I don't I don't think it would be available at all really, the ju just it w well you could make it available in the titanium, it was just it would be so expensive to buy a new case for it, because of the expense of how much titanium is is it's light and strong but I think it should be left for aircraft design rather than for for a remote. Yeah, yeah. Rubber, yeah. And you can peel them off yeah. Yeah. Yeah. Hmm. T Yeah. Also the just just going back to the interface designs with the buttons, the I kno we were planning to do some sort of touch screen. Now what I was saying before about instead of having you could have just a bare P\_C\_B\_ circuit board and I'm sure you could probably get it in different colours and so just by touching it with your finger it'd make the connection over if you had them close enough, that would be one option. Um the second option th they offer rubber buttons, but I thought that an L\_C\_D\_ type of screen 'cause one they're incredibly thin um and don't take up much space, two they you can have them in a sort of array and you can arrange the buttons on the screen in a sort of set thing and you could have them like a touch display. Uh what what Oh on the on the L\_C\_D\_ screen you could becau you could fit it the problem with it basically is that it's flat and so you can't do lots of curve curved things with it, but um you can you wouldn't have with the L\_C\_D\_ you'd have the wires coming off, you wouldn't have that with the with the L\_C\_D\_, you'd only have that with the printed circuit board. With W also with the Yeah. You could have a flat screen inside, yeah, but I'm just wondering whether we want an L\_C\_D\_ screen inside. It wouldn't be like full colour, it would just be black and white, but there'd be touch touch buttons, so you wouldn't be pressing down on 'em, w or we could have rubber buttons which are made of this material which is anti-R\_S\_I\_. Is rubber. Mm. Yeah I hadn't I hadn't really thought of t

hat to be honest. Yeah you could, you could have some sort of stylus that you could pull out but I I think they could get a bit easily lost, 'cause I had Hmm. Yeah. Yeah. Yeah. Yeah okay. Yeah that's yeah that that's the end of m my Yeah. Uh yeah. Yeah yeah that that would be fairly simple, I mean you'd you'd actually have two separate you'd have two separate circuit boards but they'd be joined by wires or like some cabling between them, 'cause in the in the actual flip bit you'd have some linking. Mm. Um. Yeah. I mean you can you could do it, you could have a 'cause if you if you just put the full charge through an L\_C\_D\_ display it'll completely blank it out, but I don't know if you could get any mirror effect on it, I'm not sure about Yeah. Yeah. Yeah. If you if yeah if you have like buttons that appear on the screen in this L\_C\_D\_ screen. Yeah. Yeah. Yeah, yeah but you can do it with your thumb li Yeah. Yeah. Yeah. Yeah. Well, yeah we Yeah. Yeah. Mm. Yeah I think I mean if Yeah it is it is qui it's quite a cool feature to have and also if they've got it if they've got these parts already in stock, then it won't be cheap to re-manufacture them, uh or it will be cheap sorry to re-manufacture them. So do you reckon that's a good idea that, where's the remote, I'm here thing? I think that would be quite fun. Yeah. Yeah. Yeah to s th well it's it's not as expensive as it would be if it was full colour 'cause if we've just got a black and white one, I mean they use them in calculators so. Yeah. Well you cou um. K no the kinetic ones come come with um a sort of w watch a battery that goes in a watch. So it's a lot smaller, so it would Yeah. Yeah the well I think were we're going for the L\_C\_D\_ on that one, on the buttons, on the on the on on the top one we're gonna yeah. On the bottom we were gonna have the rubber, the rubber ones, the anti-R\_S\_I\_ ones. Um, okay on we've got the flip the flip-screen, the top one is gonna be the L\_C\_D\_ and the bottom one is gonna be the rubberised buttons. Plastic, okay. Yeah. Mm no. Mm. You can you

can just Yeah. Yeah. Yeah, yeah j with these rubber these rubberised ca not the actual uh plastic outside case, just the rubber thing that goes round the outside. Oh yeah, yeah the whistle ones, yeah. Yeah. Yeah, depending on the expense of it. And they've got in stock, so yeah. Yeah. Okay. Did it? I'll wait until you're all um hooked up. Okay. Put it on in that way. Thanks. Okay. Welcome back everybody, hope you've had fun. Right um this is our conceptual design meeting, um I think we're slightly ahead of ourselves from the last meeting, I th I I think yeah um. This is where we talk about um properties, materials, user-interface and trend-watching. So I think we've touched on a few things to do with that already, but we'll just go over it. Um the minutes from the last time. Um we had a couple of um changes in our plans in that we couldn't use teletext, it wasn't gonna be a control for everything um and that we had to incorporate the image of the company into it somehow. Um we have decided on a leaving out the voice recognition, we've decided on there being a flip design and um a different shape from what's normal. We were thinking a shell, but something along those lines, just a different shape from what's normal, um. You were going to look into the rechargeable batteries and we were gonna think about the port and an alarm for getting it lost, things like that, um and our market was going to be young, business, kind of range. Okay, so shall we start with the first presentation? Yes if you feel It's okay. Yeah. Okay thank you very much. Um let's start from the inside and work our way out. I don't think so, not yet. Um, yes, thank you. I hate those little things especially if you do them on too tight and you can't get the leverage on them to undo them. Okay. 'Kay.. 'Kay. Wa can you explain that? Like a right, okay. How what kind of how I long can you get out of that, I mean can you pick it up and then w

ind it for two minutes and then that's it for the night? Or That doesn't count though does it? I thought it was U\_V\_ like Any, any I'm pretty sure that solar is from the sun. Uh, I don't think it counts electric lights no, but I mean not many you don't want to limit your market. I mean people who live in basement flats there's not that many people, but there are people. Mm, but then it would be charging through the day, I think the point is that it charges through the day and then you've got it charged for the evening. Okay. Yeah I've seen But then if you think about a watch, it's on your wrist so it's on your whole bod it's on your body the whole time so you're walking around, you're doing things, it is moving a lot of the time. If you'd I mean you switch the T\_V\_ on, then you put it on the side, then you pick it up to change it and then you put it on the side. Is it really gonna be enough? Okay. So it's not the draw on it isn't Okay. Like a dual kind of. Expensive as well. What kind of price are we looking at for I presume the normal batteries are the cheapest? Solar. Well they're not designed Practical-wise okay. You do get a bit of wear but don't calculators have a battery in them as well? Mm. Okay, can we add in uh an attachment to closing feature? Can we think about that? 'Cause if we're doing the kinetic thing and it's Well add it in to think about um because, where am I? If it is the kinetic thing and it is small and it is portable and it is a different shape and the kinetic is something people don't do kind of we're doing something original and different um but if you wore it if it's something you could just clip on your pocket then you would have that less, you you wouldn't lose it so much. But then maybe that's looking at someone who's just sitting on their own rather than the eternal battle for control of the controls. No. Okay. Okay, right. Mm-hmm. What kind of things do we have to consider there? Can we what kind of size, does it come in varying sizes or is it just one size and we would have to fit the design of Mm-hmm. Okay. Okay. Mm-hmm. Mm-hmm. Mm. Mm-hmm. Hinged, yeah. So instead of the fascia that comes off being plastic, the fascia that comes off would be the rubber, like those pens that you get with the grip, that you can you can pull that off. Okay. Mm. Well that's been really popular with mobile phones so I don't see why not. 'Kay. Mm-hmm. Mm-hmm. Oh it would be flat inside. Mm. I think it would be good to have a contrast between, if the whole thing is gonna be this rubber thing it would be good to open it up and see

something quite fancy looking inside. Now how would you distinguish, if you had it bare, how would you distinguish where you had to press, I mean Uh Like one of the palm pop thing. It would have to be attached. Okay, we'll talk about that so if you finish your and we'll come back to that. That's you, right okay. No. We're marketing to guys as much as we are to women. Well it's a remote control, you were sitting watching T\_V\_ are you gonna want to sort of open it and say oh shit I should go and have a shower and do my hair before I put the T\_ Yeah, no, no. Mm. Okay. Okay, okay. Mm. Mm. Okay. Which means Okay. Okay. Mm-hmm. Can we swap that round so th that the ones that we use all the time are on the bottom part? 'Cause if you're thinking about holding it you would be using your thumbs to press, just like a mobile phone. Yeah. That's what I was just saying, and then have the and then have the L\_C\_D\_ at the top and then be able to touch that for the other controls, so have the um the volume and the programme, things like that, on the lower side. Okay. I can't see that, is that play and stop and things? Or is that volume and channel? Okay. Right. Okay. Um I'm not sure how long we've got left, but we need to make a decision about um the things we've discussed. So, we agree on Do we agree on the battery? Yeah. Um, that means that there's no function for li the port, you know that it sits in, then

pressing the button then having so we could incorporate voice recognition for the finding it. It's a bi i it's like a g it's a gadget, it's a selling point. I think the only I think the only pitfall that we would have would be how much it's going to cost if that means we have to cut down somewhere else, but I think pretty much we've used cheap relatively cheap and simple things. The L\_C\_D\_'s not cheap. Yeah, okay. And you could yeah. Okay. Do you want like a back-up? Um, okay so we've got battery. The inside components is pretty standardised across the board isn't it? So there's not a really a decision to be made there, um. The buttons what did you give us as our The bare-board L\_C\_D\_ or On the top one okay you've got the touch okay and then Okay, okay. No, it's fine. For the inside. Mm-hmm. Oh I think so, I think so. No I think I we don't wanna be tacky if we've got a kind of different shape anyway um the fact the m the material that we would be using would be cheap, so we could make it red, we could make it um psychedelic, you know, we could make it black and white zebra stripes, but that's not really what we're focusing on, what we're focusing on is the m you know yes. So we could just pick anything. It's just different it's just different from everything else and I mean, I'm trying to imagine um clean looking houses, sort of beige and black um so you either want something that goes with that, which is what's on the market anyway, or you want something that contrasts as you know like you get clocks now that are more of a talking point than an actual clock because they're so interesting and Mm. And you would just have an across the b you would have so many different options that you could do, you could have um a plain black one, you could have sparkly pink glittery ones for your little Mm. And ones tha ones that have rubbery spikes y you know, you could just go so far with it, like a puffer fish, you could just, you could take it wherever, so I think that's quite a flexible thing. Yes. Mm. Yeah. Okay we've got five minutes, um, or that might've been up for a while. Mm-hmm. Have you Okay. Well they do, but I think we can you could well it is, it is, I think you just address that with um advertising. Um, you associate the name with the individual product that it is and that does the work for you. Obviously it'll have a logo on it just like everything, but everything else has a logo on it. The point is that it's got to stand out somehow differently but I think it does, without that so I'm not worried about that. Depending on how i I mean we've got this memo saying that it's something that the company's looking into, so um that seems to make sense, but if it turns out that it's hugely expensive we'd have to cut down somewhere else, then it's worth thinking about. But I think we'll find out more about cost afterwards. Right I'm going to wrap it up there. I got a end meeting now message on my mo yeah so. Um so I think we've probably got it says, closing we have forty minutes so I um think we've probably got about that

time before we come back. It's either that or we only had forty minutes to discuss what we just discussed and don't know how long that took. Is everyone happy? Okay. Oh good grief. 'Kay. Oh. Mm. Mm-hmm. Shall I? Okay. We just connect up. Thank you. There we go. Okay um so we decided on our market and so this feedback from the marketing department is really about trend watching. Um the methods we used to decide on uh current trends and so on, market trends, were that we did our traditional uh our usual market research study uh with a hundred subjects and the the general feedback from them is that the most im uh w I'm sorry I'm slightly tongue-tied after lunch, sorry Project Manager. Um we decided on the most important aspect i uh required in a remote control device and we'll come to that later. So that was one of the first things we did. Also with our company um being forerunners in uh putting fashion into technology

, we also looked at a fashion update um using our consultants on fashion and design in Paris and Milan. Uh so the general findings from that was uh in the market trends the most important aspect for remote controls were people want a fancy look and feel, rather than the the current functional look and feel of remote controls. They also also want a remote control to be technologically innovative, and of course, as we predicted, that it should be easy to use. Now I should point out that the first of those findings, fancy look and feel, is the most important, is twice as important as the second, technologically innovative, which is in turn twice as important as being easy to use. So possibly that the feature that we put first is actually third is still important, but it's third in order of preference for the the subject group we looked at. Okay, um, now the fashion update which relates to very personal preferences among our subject group, um we found from our um consultants in Paris and Milan who des attended all the design and fashion fairs there, that fruit and vegetables are going to be the theme for clothes, shoes and furniture. So should we be thinking of using something like that in our remote control design too? There also seems to be um a trend towards a spongy feel to materials, uh again in contrast to last year. So a lot of interesting feedback there, both from our market research departments and from our people in Paris and Milan. Be interesting to see what our design people make of that. Unless anyone has any questions about that? Not yet? 'Kay. Okay. I know. Does does light charge as as sunlight does? Artificial light? Has to be solar. Mm. Artificial light, no. That's going to I know, different parts of the world too, if we're if we're marketing internationally. Mm-hmm. Hmm. Mm-hmm. Mm. Could I just ask referring back to solar charging, is that compatible with um standard batteries? I mean, could people put standard batteries in but with a s you know they could leave it in the sunlight for solar charging or the two things not compatible? Mm. So that affects the exterior design. Mm. Again it de Mm. It would just detract from the attractiveness of the of the whole feature, i it's not gonna add anything, okay. Shouldn't we do some market research on that first before we add it in because I I personally right, okay. It's not something that's come up in any of our uh focus groups and market research, it's not a thing that people are looking for when we threw it open to the field yeah. But it's something to put on the side to think about maybe. Mm. Okay. Mm. Mm-hmm. It does mark quite easily too if you let it fall. I've got a mobile phone myself which is titanium and it does mark very easily if you drop it. I was just wondering if we make the basic mould out of plastic but have like a rubber cover that goes over, that would give the spongy feel, that also allows us to kind of have different fasciae for the phone. Like a rubber sleeve almost, yeah. Mm. Mm. Very cheap way of changing the look of it and people can just buy a new one if they want to. Mm. Yeah. Mm. I don't s sorry to interrupt, I don't see why the curved thing is a problem, if we for example had a shell, once we open that yeah, so it'd be f yeah, yeah. Have I misunderstood you? Mm-hmm. Mm-hmm. Yeah. I just had another idea, I don't know if it helps with that, but just to do with the R\_S\_I\_. Is it possible, just as an option, when we open it up, people can use their fingers to

press the button, or we have inside like a small pointer thing when people want to. Mm. Yeah. They're easy to replace as well, cheap. Mm-hmm. Mm. Yeah just a thought they wouldn't actually need one and they could use anything they've got, couldn't they? A pencil or a pen, so they wouldn't really need a Mm-hmm. I'll just raise another point while it occurs to me, it kind of applies to both our designers here, so I'm not sure how it would fit in. If we flip open, now you know how you've got

some mirrors in nightclubs that are mirrors when you turn to them and you turn away and it gives like an advertising display, you seen those? And they kind of respond to the turn of your body. Is it possible that when we open our flip-top shell it's a little compact mirror and when you press a button it then goes onto the phone display th uh the remote control display thing. They don't look at themselves? Just a thought. Yeah. I know what you mean, it's with us using the ideas for a mobile ph it's with us using the ideas for mobile phones I kinda got sidetracked onto that I think, okay. trying to think of other features we can build in that wouldn't cost too much but maybe we'll leave that one on the side. 'Kay. Mm. Oh I think forget about the mirror that was just a very quick passing thought yeah. Sorry what does that stand for? Okay. No you'd hold it you don't if you flip it open then you'd be Wouldn't you? Isn't that the idea? You us if we just use the shell as an example again, you open that, you've got your L\_C\_D\_ display there and you've got the buttons there so you're holding it in the palm of your hand, yeah. Mm-hmm. Mm-hmm. Hmm. Mm. Mm. Kinetic? Mm. Mm. Hmm. Yeah, we talked about kinetic charging, we've deci seem to have decided on that, did we decide on double A\_ or triple A\_ batteries? No, one of the decisions we had to make was whether we had double A\_ or triple A\_ batteries 'cause they've still got to be charged this way haven't they? I oh I see. Right, okay, got you. Got you on that okay, didn't realise. Sorry could you repeat that last part? L\_C\_D\_ screen. Mm-hmm. Okay. Mm-hmm, so we decided on a rubber casing for the plastic shell, a variety of designs, okay. and it is just uh although it's rubberised and spongy, apart from that we're just going to go for sort of vegetable and fruit colours, we're not gonna try and make it actually a vegetable or fruit design or anything else, like a shell that we discussed, just go for the colours. Okay. Mm-hmm. The feel. 'Kay. Mm-hmm. Is that going to be this image I've got in my head of something kind of shaped like that, maybe about that size, made of plastic, fits into the palm of the hand, rubberised cover that's spongy. Is that really going to fit fancy look and feel which was the major thing that people wanted, market research, is that fancy? Mm. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. I'm just kind of pushing at that to see if you came out with anything else, but I mean I totally agree. We looked at those remotes, I mean they are kind of anonymous, very similar looking things. This would definitely be different enough, I just wondered if anybody could come up with something even more Well the thing is the rubberised covers are going to be s relatively cheap to produce, that if in a year's time we we get feedback from the design fairs that show something else is coming I mean it's so easy for us to just produce that and it can be slipped on, which is another beauty of it. Mm, so can I just recap uh Sarah, for the decisions that we've made, kinetic charging, the watch-type batteries, um L\_C\_D\_ display on th the top side of the flip top, rubberised buttons on the bottom side, we're gonna use fruit and vegetable colours for the rubber cover, the case itself is plastic. That's how far we've got, what else do we have to add to our decisions here? Mm. Yes, it was just, there was just a cost issue with that, but it's a good idea we just need to check on the cost, is that right? And incorporating the company logo? Mm. 'Cause I took it from the feedback you gave in the last meeting from y from y your report, it's not just a case of having a little R\_R\_ hidden somewhere, they do want it to be obvious that it's our product don't they? Since it's the only one of its kind on the market it's obviously gonna be ours. Yeah. Okay. Okay. Okay. Did we I know at the last meeting we spoke about a beeper, I think that was you talked about a beeper for a location,

have we just rejected that in  
favour of voice recognition then? You got to go through.

---

# Meeting ID: 120

Data Source: Train

## Executive Summary

So is the agenda ? Opening , acquaintance , tool training and project plan , discussion and then closing . Project aim is a new remote control . It's original , uh trendy and it's user-friendly . Try out the whiteboard , every participant should draw their favourite animal and sum up their favourite characteristics of that animal . so , I guess that was the test to see if this equipment is all working . Okay , project finance , selling price twenty five Euros , profit aim fifty million Euros . Market range internationally sold . it's gotta be can't cost any more than twelve fifty to make . Next meeting starts in thirty minutes . I mean the last slide wanted us to maybe discuss longer what our what our ideas where . Yeah , I think we're I mean before we close the meeting , we're supposed to come up with some ideas for Oh k so we're actually supposed to be doing this discussion like right now are we or Right , who's got experiences with remote controls then ? Is this a T\_V\_ one we are supposed to make ? Yeah . Yeah it's a T\_V\_ remote control . Are we are we going for like like telephones are going little teeny tiny things or we are going for something that's that's big and I mean , you want you want one remote that maybe can work uh all all of the functions of T\_V\_ and if you have whatever associated with T\_V\_ the D\_V\_D\_ player , or something like that , but like at the same time you don't wanna really busy remote with a thousand buttons on it or something . 'Cause I I I mean I was thinking something that's got different like maybe a a an L\_C\_D\_ display on it that's got different pages for different devices , but that would p that would probably be quite expensive . and then after we after we've found out what we can like , some different ideas , we can then go and do the research to find out if these any of these ideas are feasible or not . So would be nice to have something that that controls lots of different things . Couldn't we have like one that comes out ? you actually just putting three or four different remotes together but making them thinner , and um into one basically . Um have uh one very complicated one on one side with all the D\_V\_D\_ and V\_C\_R\_ access and stuff , and then on the other side o one uh a remote control that would be very very simple with just the channel , program plus and minus , and the just the mute button , for example . I'm not sure if it's a good idea to have a two sided remote though , 'cause it would be very hard to use in the way that you mani manipulate it . No , but you would slide it into uh someth like something on the back would hold or something like a flip telephone , something like that maybe . Okay . Um so I mean we still have time in our next meeting to come up with the actual concept for the user interface , I guess by the end of this meeting we should have at least a a rough conception I think we should also have a back-up

plan of I but also devices connected to the to the T\_V\_ , I mean , be able to operate D\_V\_D\_ players , things like that . 'cause I I I just think that it might be expensive to make something that but the the functions that we're sure that we want are that it can control the T\_V\_ , We should have a back-up plan of just a really good television remote control , that just that is just for a T\_V\_ , but it's just a really good , nice one . But what'll make it what'll make it interesting for people to buy though ? have it be like ergonomic so it's comfortable to use , Or maybe even so something that's for disabled people or big buttons for touchy buttons for I think a flip up thing , like a lock f like a lock functs function on it like you have on your telephones , User Interface Designer , that's that's so you gotta you go , you're you're gonna be the one that's working out what what buttons we need . Um . Industrial Designer , you are the one , you know , you're gonna be working out kind of box it goes in , I guess so , um Mm . Har how it works an And in marketing User requirements specifications . Do you think our two kind of overlap , because Yeah , it does seem like our our responsibilities have some overlap . You two you two are gonna be just , I think , you just double up , you know , you working together . You're the one that's gotta go and find out do th do the research ,

## Complete Meeting Transcript

So we're 'kay? On the or No. I dunno where to put it 'cause the Okay. Could you s take it off?. Okay. Are we free to take notes uh Okay. Okay. So are we supposed to bring the little things for the Mm. Yeah. okay. So my favourite animal 'Kay um Um okay, it's big, it's got a great memory. Supposed to have a great memory, we say an elephant never forgets. And uh dunno know why but looks like nice to me. Nice animal. Okay. No. Really? Oh that's a Not bad I would say. Very good. Mm. Yeah. Is this a T\_V\_ one we are supposed to make? Okay. T But how do we know how much uh, I mean, how much do we have per how much? Twelve fifty. So do we have to be realistic within the budget or Close pr I don't know how much it would cost. Yeah. Right. Yeah. Um have uh one very complicated one on one side with all the D\_V\_D\_ and V\_C\_R\_ access and stuff, and then on the other side o one uh a remote control that would be very very simple with just the channel, program plus and minus, and the just the mute button, for example. I can real keep it really really simple on one side and the other side be very complicated. Yeah. Or grandma as well, you know it's like what is the mute button. No, but you would slide it into uh someth like something on the back would hold like you wouldn't be able to press the buttons, but Start breaking up. Yeah. Yeah. Could be really light or, I dunno, something special. Yeah, 'cause at the end of the day if it says just T\_V\_ remote, doesn't say com combination with all all the r Mm. Okay. That's Mm. Mm. Har how it works an Bu Do you think our two kind of overlap, because Yeah. I don't Yeah. The back end of an elephant. Aesthetic yep, sure. 'Kay, my favourite animal, uh let's see. Dunno if any of you have seen Napoleon Dynamite before. It's a liger, a combination of a lion and tiger. Have you not seen Napoleon Dynamite? Oh it's a hilarious movie. You have to see it. And and it's best characteristic is it's pretty much the awesomest animal. But you have to see the movie to fully appreciate it. There go. A prairie dog? Oh a squirrel? Yeah, that's pretty good. Alright. So I think before we close uh, we are expected I mean the last slide wanted us to maybe discuss longer what our what our ideas where. I mean if you wanna go back to the last slide. Uh S Yeah, I think we're I mean before we close the meeting, we're supposed to come up with some ideas for Yeah. Yeah. Yeah, I think

this is just the preliminary, get some rough ideas for what our experiences with remote controls have been and and what we would roughly what we would incorporate into a new one maybe. Yeah, I think we've all got Mm. Yeah it seems like there's like there's sort of a tension between two ideas, I mean, you want you want one remote that maybe can work uh all all of the functions of T\_V\_ and if you have whatever associated with T\_V\_ the D\_V\_D\_ player, or something like that, but like at the same time you don't wanna really busy remote with a thousand buttons on it or something. Mm. Yeah. It g can't be more than twelve fifty per unit. Cost. Yeah. Yeah. I'm not sure if that's like I'm not sure if it's a good idea to have a two sided remote though, 'cause it would be very hard to use in the way that you mani manipulate it. Oh. Oh okay. Yeah. Okay. Mm-hmm. Yeah, we should uh I guess by the end of this meeting we should have at least a a rough conception you know stage one was technical functions design, what effect the apparatus should have. Okay. Um so I mean we still have time in our next meeting to come up with the actual concept for the user interface, but the the functions that we're sure that we want are that it can control the T\_V\_, but also devices connected to the to the T\_V\_, I mean, be able to operate D\_V\_D\_ players, things like that. Yeah. Okay. Right. Yeah, I mean. Yeah, that's true, maybe we should just concentrate on having a a good T\_V\_ remote, and have it be um have it be like ergonomic so it's comfortable to use, uh simple to use, and looks decen

t and Sorta find a niche for our remote, like market it to a certain kind of p kind of people, certain certain demographic Yeah, no I think you're right. Yeah, rathe rather than focus on Y Yeah. Yeah. Remotes spinning out from other remotes and having little nested remotes inside. Yeah, that's true what you were saying, I mean it doesn't have to have a flip function, it can just have a lock function, so that it's not uh not usable when you don't want it to be usable. I guess that's good good for now. That's me. Okay. Right. Right. Yeah, it does seem like our our responsibilities have some overlap. Yeah. Alright, see you in thirty minutes. Is that alright? or Okay. Keeps coming off. 'S fiddly. Right. Oh, another one. Ah. Very nice. 'Kay. Okay. Clip. Ah. It's an elephant. Oh my gosh, I'm never gonna be able to draw that well. Does it? Oh. Mm. I have no idea what my favourite animal is. Oh. It's A what? Alright. How. No. Great. Me? Okay. Not quite sure how this is gonna work. Cool. Uh well I'll try my best to draw. Can I just draw the face? Ooh. It's a cat. Which also has what? A big fat body and big and a long tail. Why? Because um cuddly. And usually cats are very friendly. Usually. And they're healing as well. They heal. And they can feel when a human's got problems so So, that's why I like cats. There we are, that's me. Mm. Mm-hmm. Ah. Market range internationally sold. Ah right okay. Yeah. Yeah. Uh. Yeah. Yeah it's a T\_V\_ remote control. Well. A new remote control for T\_V\_. What would I like? Um. Medium. Mm. Twelve fifty. Each. Guess Couldn't we have like one that comes out? Like so you have one in like mm it doesn't have to be really thick. I mean remote controls can be thin bits. And then you have one for your D\_V\_D\_ and you sort of slide it out, and then you have another one, you slide it out. have slides. And then it all comes compact into one. So it's not you actually just putting three or four different remotes together but making them thinner, and um into one basically. So you just flip them out. That would be cool. I was thinking that like a flip. Okay. Um.. But what'll make it what'll make it interesting for people to buy though? I mean if it's if it's just like Mm-hmm. Mm. I think a flip up thing, 'cause you always have this problem of like if it's on this well I did anyway, like we had five or six remotes and they would be lying on the c on the coach, and you'd come and sit down and ooh, the telephone's the television switched on or something. So maybe something that like does have a lid or closes, so you don't accidentally press a button or record button for something. Yeah. But make it like really snazzy and cool people will want it. So make it Yeah. Yeah. Mm. Yeah. And even for kids as well. It's um it's safer for them, I guess. Like they don't flick onto channels and all that sl flick onto. Mm. W What does

I\_D\_V\_I\_D\_N\_M\_E\_ stand for? Ah ri okay. these are requirement specification. And I'm marketing. These are requirement specification. So what the user requires in a remote. I guess that's what it says. Mm. So, do we take these off? Mm-hmm? Okay. Ooh. Hmm. How do we sta wa how do we start? Does anybody know? So that's this Oh okay, right. Uh.. Hmm. Okay, just hang on a second everybody. I haven't actually looked at this yet. um I haven't looked at it, but let's just start it off and we'll see what happens. If you're all ready. So is the agenda? Opening, acquaintance, tool training and project plan, discussion and then closing. Project aim is a new remote control. It's original, uh trendy and it's user-friendly. Project method, functional design, individual work, another meeting, conceptual design, individual work, and a meeting of details design, individual work and a meeting. Tool training. Try out the whiteboard, every participant should draw their favourite animal and sum up their favourite characteristics of that animal. Um. Uh Miss Industrial Designer, would you like to go first? Yeah, why don't you just

c, I think just clip on clip do you have a belt? Or put 'em in your pocket, yeah. Yeah, what's your favourite animal? Is it rude? That's a very good elephant. 'Kay, and you want to write up on there, it says you've gotta sum up your f f your favourite characteristics of that animal. Mm. Okay. Wonderful, well done. Do you want to use the wipe the m the wiper and wipe it off? And Mister aesthetics designer do you wanna go next? No. No. Okay, well done. Yeah. Miss mar Miss Marketing? Um yeah, I think you can just draw the face, but then you'll have to describe in writing how the rest of it looks. That's a very pr pretty cat. Okay, do y do you wanna do some write you wanna just write some words about it? Wow, so they're kinda spiritual. Well done. Okay. Um, I don't actually have a favourite animal, but for the for th for this meeting I'll s draw a little Uh. I honestly can't draw for toffee. Uh. Yeah. no no uh That's exactly what it is. Uh not a very good one Okay, well, you got it's a s It's a squirrel, and I like them, because they're cute and stupid. Right. Okay, so, I guess that was the test to see if this equipment is all working. Mm. Let's move on to the next page. Okay, project finance, selling price twenty five Euros, profit aim fifty million Euros. Yeah. Production cost, ah right it's gotta be can't cost any more than twelve fifty to make. experience with with remote control, so talk about who who's used what. Any ideas? Stuff like that. Next meeting starts in thirty minutes. At quarter to twelve. Yeah. Oh k so we're actually supposed to be doing this discussion like right now are we or oh okay. I thought this was just t giving us instructions for the re to do next, but Okay. Right, who's got experiences with remote controls then? Pretty much everybody. Um. 'Kay um. W what You want it big do you want it small. Are we are we going for like like telephones are going little teeny tiny things or we are going for something that's that's big and Video and ts hi-fi and stuff. Maybe you yeah now th that's the other thing is it's gotta be cheap. 'Cause I I I mean I was thinking something that's got different like maybe a a an L\_C\_D\_ display on it that's got different pages for different devices, but that would p that would probably be quite expensive. Per unit, yeah. Well at the moment we could, wa I mean we 'cause we this is what we th what we're doing at the moment is just saying what what we'd like, and then after we after we've found out what we can like, some different ideas, we can then go and do the research to find out if these any of these ideas are feasible or not. So would be nice to have something that that controls lots of different things. Um. 'Kay. Okay, that's. Th that's an idea. Okay. One side for kids, one side for adults. Like it or something like a flip telephone, something like that maybe. F flip it open and you've got all the buttons, or you flip it closed and you've just got the basic buttons on the outside maybe. Um, oh we've got five minutes left. But okay. Well we've got a k we've got a few ideas there. Yeah. I have got I think we should also have a back-up plan of I 'cause I I I just think that it might be expensive to make something that I mean we don't, we haven't been told it has to be something that will control everything. We should

have a back-up plan of just a really good television remote control, that just that is just for a T\_V\_, but it's just a really good, nice one. What do you reckon? See 'cause, I'm just thinking bearing in mind that we've gotta we have to have something that's cheap to make. I think we'll be able to come up with ideas and stuff a lot quicker. Yeah. May w you know, maybe even Or maybe even so something that's for disabled people or so people that uh b don't see very well or big buttons for touchy buttons for Yeah. Or just one that looks really fucking cool. Otherwise we'll be we'll be here all day talking about do this let's do that n I think we sh I think we should Yeah. I m

ean obviously everyone we're uh you know uh sounds like we're all a bit sort of gadget heads and we like things that do everything at once, but you know, that's Yeah. Yeah, that's right. Yeah. I mean I'd like one that makes tea as well, but that's not gonna happen. Okay, like a lock f like a lock functs function on it like you have on your telephones, yeah. Yeah, it's gotta be sellable. Yeah. Yeah. Okay. No porn channel for children. Okay. Um alright, so we've got some ideas, we've got um Let's move on. Oops, let's close that. Next meeting, uh okay. Industrial Designer um which is Um. Yeah, there you go. So User Interface Designer, that's that's that's you, so you gotta you go, you're you're gonna be the one that's working out what what buttons we need. Um. Industrial Designer, you are the one, you know, you're gonna be working out kind of box it goes in, I guess so, um whether it's what goes into the box, somehow. And in marketing User requirements specifications. Yeah, what Right, okay, yeah. You two you two are gonna be just, I think, you just double up, you know, you working together. You're the one that's gotta go and find out do th do the research, see what people want in a remote, what buttons are used more often, and s stuff like that. Oh, we've been warned to finish the meeting now. Okay. Okay everyone, well done. Good meeting. Yeah.

## Executive Summary

The project manager introduced the upcoming project to the team and then the team members participated in an exercise in which they drew their favorite animals and discussed why they liked those particular animals. The project manager discussed the project finances and the team engaged in a brainstorming session about various features to consider in designing a remote. The project manager then further discussed the roles of the team members.

## Complete Meeting Transcript

So we're 'kay? On the or No. I dunno where to put it 'cause the Okay. Could you s take it off?. Okay. Are we free to take notes uh Okay. Okay. So are we supposed to bring the little things for the Mm. Yeah. okay. So my favourite animal 'Kay um Um okay, it's big, it's got a great memory. Supposed to have a great memory, we say an elephant never forgets. And uh dunno know why but looks like nice to me. Nice animal. Okay. No. Really? Oh that's a Not bad I would say. Very good. Mm. Yeah. Is this a T\_V\_ one we are supposed to make? Okay. T But how do we know how much uh, I mean, how much do we have per how much? Twelve fifty. So do we have to be realistic within the budget or Close pr I don't know how much it would cost. Yeah. Right. Yeah. Um have uh one very complicated one on one side with all the D\_V\_D\_ and V\_C\_R\_ access and stuff, and then on the other side o one uh a remote control that would be very very simple with just the channel, program plus and minus, and the just the mute button, for example. I can real keep it really really simple on one side and the other side be very complicated. Yeah. Or grandma as well, you know it's like what is the mute button. No, but you would slide it into uh someth like something on the back would hold like you wouldn't be able to press the buttons, but Start breaking up. Yeah. Yeah. Could be really light or, I dunno, something special. Yeah, 'cause at the end of the day if it says just T\_V\_ remote, doesn't say com combination with all all the r Mm. Okay. That's Mm. Mm. Har how it works an Bu Do you think our two kind of overlap, because Yeah. I don't Yeah. The back end of an elephant. Aesthetic yep, sure. 'Kay, my favourite animal, uh let's see. Dunno if any of you have seen Napoleon Dynamite before. It's a liger, a combination of a lion and tiger. Have you not seen Napoleon Dynamite? Oh it's a hilarious movie. You have to see it. And

and it's best characteristic is it's pretty much the awesomest animal. But you have to see the movie to fully appreciate it. There go. A prairie dog? Oh a squirrel? Yeah, that's pretty good. Alright. So I think before we close uh, we are expected I mean the last slide wanted us to maybe discuss longer what our what our ideas where. I mean if you wanna go back to the last slide. Uh S Yeah, I think we're I mean before we close the meeting, we're supposed to come up with some ideas for Yeah. Yeah. Yeah, I think this is just the preliminary, get some rough ideas for what our experiences with remote controls have been and and what we would roughly what we would incorporate into a new one maybe. Yeah, I think we've all got Mm. Yeah it seems like there's like there's sort of a tension between two ideas, I mean, you want you want one remote that maybe can work uh all all of the functions of T\_V\_ and if you have whatever associated with T\_V\_ the D\_V\_D\_ player, or something like that, but like at the same time you don't wanna really busy remote with a thousand buttons on it or something. Mm. Yeah. It g can't be more than twelve fifty per unit. Cost. Yeah. Yeah. I'm not sure if that's like I'm not sure if it's a good idea to have a two sided remote though, 'cause it would be very hard to use in the way that you mani manipulate it. Oh. Oh okay. Yeah. Okay. Mm-hmm. Yeah, we should uh I guess by the end of this meeting we should have at least a a rough conception you know stage one was technical functions design, what effect the apparatus should have. Okay. Um so I mean we still have time in our next meeting to come up with the actual concept for the user interface, but the the functions that we're sure that we want are that it can control the T\_V\_, but also devices connected to the to the T\_V\_, I mean, be able to operate D\_V\_D\_ players, things like that. Yeah. Okay. Right. Yeah, I mean. Yeah, that's true, maybe we should just concentrate on having a a good T\_V\_ remote, and have it be um have it be like ergonomic so it's comfortable to use, uh simple to use, and looks decen

t and Sorta find a niche for our remote, like market it to a certain kind of p kind of people, certain certain demographic Yeah, no I think you're right. Yeah, rathe rather than focus on Y Yeah. Yeah. Remotes spinning out from other remotes and having little nested remotes inside. Yeah, that's true what you were saying, I mean it doesn't have to have a flip function, it can just have a lock function, so that it's not uh not usable when you don't want it to be usable. I guess that's good good for now. That's me. Okay. Right. Right. Yeah, it does seem like our our responsibilities have some overlap. Yeah. Alright, see you in thirty minutes. Is that alright? or Okay. Keeps coming off. 'S fiddly. Right. Oh, another one. Ah. Very nice. 'Kay. Okay. Clip. Ah. It's an elephant. Oh my gosh, I'm never gonna be able to draw that well. Does it? Oh. Mm. I have no idea what my favourite animal is. Oh. It's A what? Alright. How. No. Great. Me? Okay. Not quite sure how this is gonna work. Cool. Uh well I'll try my best to draw. Can I just draw the face? Ooh. It's a cat. Which also has what? A big fat body and big and a long tail. Why? Because um cuddly. And usually cats are very friendly. Usually. And they're healing as well. They heal. And they can feel when a human's got problems so So, that's why I like cats. There we are, that's me. Mm. Mm-hmm. Ah. Market range internationally sold. Ah right okay. Yeah. Yeah. Uh. Yeah. Yeah it's a T\_V\_ remote control. Well. A new remote control for T\_V\_. What would I like? Um. Medium. Mm. Twelve fifty. Each. Guess Couldn't we have like one that comes out? Like so you have one in like mm it doesn't have to be really thick. I mean remote controls can be thin bits. And then you have one for your D\_V\_D\_ and you sort of slide it out, and then you have another one, you slide it out. have slides. And then it all comes compact into one. So it's not you actually just putting three or four different remotes together but making them thinner, and um into one basically. So you just flip them out. That would be cool. I was thinking that like a flip. Okay. Um.. But what'll make it what'll make it interesting for people to buy though? I mean if it's if it's just like Mm-hmm. Mm. I think a flip up thing, 'cause you always have this problem of like if it's on this well I did anyway, like we had five or six remotes and they would be

lying on the c on the coach, and you'd come and sit down and ooh, the telephone's the television switched on or something. So maybe something that like does have a lid or closes, so you don't accidentally press a button or record button for something. Yeah. But make it like really snazzy and cool people will want it. So make it Yeah. Yeah. Mm. Yeah. And even for kids as well. It's um it's safer for them, I guess. Like they don't flick onto channels and all that sl flick onto. Mm. W What does I\_D\_V\_I\_D\_N\_M\_E\_ stand for? Ah ri okay. these are requirement specification. And I'm marketing. These are requirement specification. So what the user requires in a remote. I guess that's what it says. Mm. So, do we take these off? Mm-hmm? Okay. Ooh. Hmm. How do we sta wa how do we start? Does anybody know? So that's this Oh okay, right. Uh.. Hmm. Okay, just hang on a second everybody. I haven't actually looked at this yet. um I haven't looked at it, but let's just start it off and we'll see what happens. If you're all ready. So is the agenda? Opening, acquaintance, tool training and project plan, discussion and then closing. Project aim is a new remote control. It's original, uh trendy and it's user-friendly. Project method, functional design, individual work, another meeting, conceptual design, individual work, and a meeting of details design, individual work and a meeting. Tool training. Try out the whiteboard, every participant should draw their favourite animal and sum up their favourite characteristics of that animal. Um. Uh Miss Industrial Designer, would you like to go first? Yeah, why don't you just

c, I think just clip on clip do you have a belt? Or put 'em in your pocket, yeah. Yeah, what's your favourite animal? Is it rude? That's a very good elephant. 'Kay, and you want to write up on there, it says you've gotta sum up your f f your favourite characteristics of that animal. Mm. Okay. Wonderful, well done. Do you want to use the wipe the m the wiper and wipe it off? And Mister aesthetics designer do you wanna go next? No. No. Okay, well done. Yeah. Miss mar Miss Marketing? Um yeah, I think you can just draw the face, but then you'll have to describe in writing how the rest of it looks. That's a very pr pretty cat. Okay, do y do you wanna do some write you wanna just write some words about it? Wow, so they're kinda spiritual. Well done. Okay. Um, I don't actually have a favourite animal, but for the for th for this meeting I'll s draw a little Uh. I honestly can't draw for toffee. Uh. Yeah. no no uh That's exactly what it is. Uh not a very good one Okay, well, you got it's a s It's a squirrel, and I like them, because they're cute and stupid. Right. Okay, so, I guess that was the test to see if this equipment is all working. Mm. Let's move on to the next page. ## Executive Summary

The group introduced themselves to each other and discussed their roles in the project. The Project Manager opened a discussion about the project plan and asked the Marketing Expert to prepare an overall plan for the project. The Marketing Expert presented the initial aim of the project: the creation of a fresh, user-friendly remote control device. The Project Manager asked the Industrial Designer to create a functional design plan for the device, then asked the Marketing Expert about ideas for the sales strategy. The Marketing Expert presented an initial sales plan: to analyze the competition and to pinpoint the target marketing group. The Project Manager instructed all participants to work together on their respective design plans. The Project Manager decided that the design plans will be discussed at the next meeting, and that the next step will be to come up with a functional design of the device.

## Complete Meeting Transcript

Uh sure my name is Agnes and I'm an user usability user interface designer. Um I was wondering Mm-hmm. Mm. Mm. Well, no, not exactly. I mean my job from what I understood was to look at the usability requirements and make sure that the product is usable, it's acceptable to the people who are gonna use it and look at the best ways to do that. So I think I'll have to interact with Christine and discuss with her, so that she's not designing something that my studies will show right off the bat that it's not going to work, and so it's sort of it's a loop that feeds in, but I don't think necessarily that I'm in a coordinating position for it. Yeah. Mm-hmm. Which will also feed into the marketing, because depending on what users want, depends on how you sell it, what tag lines you attach to it, how you try to make it more attractive to users. So I think all three groups will need to interact quite a bit. Um, and then I guess build the plan based on all of that, because I think you need to take all the factors into account. Yeah, of course. Yeah, we can C\_C\_ him on any discussions or documents that are passed around. Sure. No problem. So, the immediate next step is to start determining the functional design, or okay. Mm-hmm. Okay. Mm-hmm. Mm-hmm, yeah, that would be useful. Sure. Okay. Thanks. Thank you. Oops. That's as far as it goes. Do you also do marketing? And I'm Christine, and my role in this uh scenario is to be the industrial designer. But I'm not really one. What is the goal of the project? Um no, I

I have not begun working on the design, and um I uh I actually didn't know we were designing a remote control, I thought we were designing a new monitor. Um the website I went to look at had some announcements about an introduction of a um uh some sort of a seven inch um monitor, and um I understood that that was the project goal. So um I'm glad I didn't do any work um ahead of time because uh I clearly didn't understand the project goal. Um I just did see that we were starting a new project together and there was going to be a four member team composed of these people, and um that's about uh that's and I I read through the different steps, and what my responsibilities were relative to the steps. Uh for the industrial design? Um well, I would think that depends on how much money you give us. Um because uh, you know, you can uh you can make it uh you have different choices with different financial models. Well, you know um, I kind of think that in general you have to do uh um y you have to have something that's very fashionable, that's uh very attractive that um people see and recognize uh its goal, and uh they immediately wanna have it uh have one of their own. So it would really would need to um something like the iPod would be good, seems to have caught on fairly well, so um d uh you know, I don't care what it does, just so it looks cool. Well, uh I've got a lot of other projects I'm doing right now um and so I'll have to wait and see how those uh how those go. If they uh go quickly then uh it could be a month. If um if I run into any problems in my other projects it might be six months. Mm-hmm. Mm-hmm. And when would you like that? Uh well if uh if we have enough time uh then d do you think um two weeks is a is close enough? Uh are there other people who will be contributing to the plan? Okay, I'll get back to you on that. Would you mind um at the conclusion of our meeting could you send us a copy of your slides? Thank you. My name is Ed and I do accounting. E\_D\_. Mm. No. Accounting, yes. Marketing is uh, is me. Well I think that we'll see that throughout the day in how we're going to put this together as a marketing to to market the product. We'll have to see on a through discussion on where we're gonna go from here and from with this. Uh for the moment not yet. Good question. No, this is like I said that we have to be discussed between all of us and we'll go from there. We'll have to simply we'll have to work o

n it together. Certainly by the next meeting. I'm in the sales I'm supposed to explain them what to do. We have to define exactly what our product is, from uh From what I had in mind we're supposed to be marketing coffee, is that right? Remote controls, 'cause I had two different things. I had a first part of mine was to make a remote control for a new f remote control for television, and afterward I had a discussion about coffee so we'll start with the remote control for television then. So we're have to design something that is very user friendly. Something uh visual that has something that will draw people to buy the product, because I think everybody's experienced with uh remote controls, and some remote controls are are worth uh throwing out the window. Uh th most of them ar I don't know we're have to come up with a new idea on how to make it a lot easier to use, 'cause a lot of times uh spend uh half a day through the instruction book trying to figure out how to use it. Well not yet other than uh doing research and taking remote controls and looking what other companies have to do uh, what they're building, their designs, their ideas, uh also have to pinpoint which market we're gonna go into. It should be a fairly large market because uh the number of people that uh the competition, uh th I agree it has to be something it has to be something new, it has to be something that that draws people saying eh, I like this. Whether it works or not, they have to first say I like this, I like the design, and then it's gotta be simple to use. Yeah. Mm-hmm. Mm-hmm. Do we already have a cost limit on this, th an idea of how much uh we want to market this for, how much it's gonna sell for, that's up that's up to us to decide, eh? Very good. Very good. No. Hi guys uh good morning everybody here. And uh I want to introduce myself, uh my name is uh Shrida Daseri and uh I'm a project manager for this new project

which we are going to discuss now. So I want to introduce first of all uh the names and the colleagues here. And what you're uh drawing? Uh how you spell your name uh? E\_D\_ okay. And? So only accounting? Okay. And? Mm-hmm. Industrial designer. So who is uh marketing, nobody in the market It's you, okay. So thanks for coming for the meeting first of all, and uh we have a long time, just twenty-five minutes to discuss about uh this project and the the project initiation. First of all I want to ask uh Mister Ed about your uh marketing plan and your product plan and uh Mm-hmm but uh do you already have like a functional design or a technical design or Oh for the moment not yet, okay, but uh what's what's your uh do you have some project plan, something with you or Mm-hmm. Okay, so uh by when you think you can uh give me some kind of uh project plan, okay, a discussion with uh By next meeting, okay that will be great. Uh Okay, so there's any questions or uh first of all about uh this project? Uh the goal of the project I think maybe I'll uh hand out to the Ed, okay, so to explain uh what is the project because he's in the sales and the accounting. Yes, so can you explain uh what exactly the product is? Oh I think uh, if I'm not wrong, we're making the remote control. Yes. Mm-hmm. Mm-hmm. Mm-hmm. And uh what abo uh Christine, what about your uh the industrial design plan? Are you have a design already on this product or uh you're still working on the design? Mm-hmm. Okay. Mm-hmm. So uh you'll be leading the team for your design team or how many members is working in the team, for the design? Yes. Okay. That's Yeah, but uh before we talk about uh the finance, okay, uh do you have some idea how we can uh sell this product or project in the market and how much is going to benefit to the company and uh of course it's to the individual also. Mm-hmm. Okay, but uh uh when you think you can give me like a kind of design on the functional design or the technical design? Yeah, but uh I need something in the writing, so like uh what's

your functional design, what's your technical design, and uh how many people you need for this project, and what's the time frame you're looking, okay, and what is the budget, maybe uh initial budget you're looking, okay, and uh how is going to the market, okay, so you've you've had to meet with the marketing team and how they're going to market and what are the marketing strategic plan, okay, when are you going to introduce, okay, and by the time you introduce the product and uh you know there there would be a competition, okay, so I need some kind of uh uh the plan in the writing from you. Okay, and it's po B as soon as possible. Yes I think uh that would be good, because I need to go to the management and uh tell them what we are going to do, and uh what cost is, okay, and what's the time frame and what's the project plan, because uh without any uh documentations, I cannot go to the management and say, so we are going to do this and we need this much money, okay, so then it's it's difficult for me to say, okay, that's the reason I need uh some kind of plan from you, initially, okay, then we can have the further discussion again. Yes, of course, if you need some help, uh so let me know. So, who are the people you need uh from the marketing or uh the technical side or uh the administration point of view, okay, to add in any documentation, or some technical point of view, so just let me know so I can uh coordinate all the teams. Yes. Thank you. Okay. And uh Ed uh so what's what do you think about uh this uh project for the remote control and d do you have some already planned something for your marketing strategy or uh the sales strategy? Hmm. Mm-hmm. Mm-hmm. Yes, so what I uh prefer maybe uh you need to interact uh more with the Christine, okay, because you know what she is going to do it, okay, and you know how to sell it. Okay, because uh she is doing the design, but you are the core because you are in the marketing, okay, so because you need to sell and you're the responsible for the all the money, the finance, okay, tomorrow. So, what I prefer, okay, so you need to interact with the Christine more and uh within her team, okay, who is using the functional design or technical design, okay, and uh you need to come up with some kind of plan, okay, how we are going to

do the your sales plan, okay, th Th That that's Yes, that's you have to decide, okay, so the best thing is you uh both of uh the Christine and you discuss with yourself, okay, and come up with the cost, and how we are going to compete in the market, okay, in the the technically, or in the sales wise, okay, the commercial wise, okay. Then uh we have to design, okay, how long it will take the whole project, okay, how much is going to cost us, and how much we are going to benefit for the company. Okay, of course it's it's uh of benefit for everybody individually. Okay, so I think it's uh maybe if we can uh give me some kind of your uh the sales plan, okay, including the technical what uh she's going to talk to you within the team, okay, then it will help me to discuss with the management for further, okay, and put it in the the proper project plan. Okay, and if you need uh any coordination in between uh compared to the maybe the some technical vendors or commercial vendors, okay, depends if you want to have some uh uh marketing plan or technical plan, okay, so you let me know. Okay, I can coordinate, or maybe uh, you are my coordinator, am I right? Between uh all the coor Yeah. Th Christine, yeah. Which is Yes. Yeah, so basically you need to interact with Christine more, okay, for the user acceptability, okay, and the testing, okay, then you will Yes. Yes. Yeah. Yeah. Yeah. Yep. But what I request, okay, keep Ed in the loop, okay, in between your uh meeting and Christine meeting, because uh he should know what's happening. Yes. Okay and please please copy all the mails, okay, all the discussions to me, okay, so I need to submit to the management. So any questions fo

r uh time being? Yes. Okay. To come up with the functional design and uh to discuss with Ed, okay, and how it's going to be work, and uh first of all with your user acceptance, okay, how it looks like and how it's going to be work in the market, okay, so then we can discuss about uh further things. So, we'll meet when the we'll discuss on the further meeting. It's okay? Thanks for coming. Yes, I will. Yes. I'll copy, uh le let us keep all the emails and all the copies, okay, share each other, okay, so you know everybody what's happening, okay? And if anything you need anytime so please either you can call me, or just send me email, or uh just come and uh knock my door, okay, so I'm available here. It's good? Okay, thanks for coming and uh I wish you a nice time then. Okay, see you later. Bye.

---

# Meeting ID: 87

Data Source: Train

## Executive Summary

The marketing expert reported on research which shows that users think most remotes are ugly, easily lost and bad for RSI. Audio settings are rarely used, and the power, channel and volume buttons are used most often. The remote should be user-friendly and have a good look and feel. The marketing expert and project manager described the new requirements that the target group is users under 40, the remote should not include teletext, should be only for TV, and should feature the corporate logo. The user interface designer showed examples of two contrasting remotes, recommending that they should use the best features of both. The group decided to use an LCD screen and speech recognition. The industrial designer described how a remote works, and explained that his presentation was incomplete because he had not received the necessary information in time. The group discussed what functions to include and the layout of the remote, and the marketing expert drew a possible design on the board. They decided to have buttons for the basic functions and make the advanced functions accessible through the screen. They also discussed what buttons would be needed to navigate the menu on the LCD screen.

## Complete Meeting Transcript

You all saw the newflash? Or you got the same message? Yeah sorry. Yeah. Yeah I received an email so I thought I I can't mail you so I thought I'd just drop it in the folder, but Is it unlocked? Woah. I uh kind of opened it. Uh Okay. 'Kay. Everybody ready? No no no. Yes yes yes. Okay. 'Kay. Can we get started or is there some pressing issue? Oh no pressing. Did you plug in the power cable when you come back? Yeah. That's difficult. Yeah. Yeah. Format save. Yeah. Oh yeah sure. You have Playstation also? Huh. Okay. So there we are again. Yeah. Okay this is the agenda. Um we have three presentations, I heard. Yeah really. So who wants to start? Yeah. Uh this is you? 'Kay. Yeah. often. Next generation does. N not used anymore. Yeah. Yeah. Not by mail. I receiv the mail but you don't. So That's in the presentation, so Uh below I believe. Yeah below forty. Mm-hmm. Our current customers are in the age group forty plus. And the new product should reach new markets, which is the customers below forty. That's in a newflash. Yeah. But it also needs to have corporate identity. Present and the

colours. So we can't change much of that. Mm-hmm. Mm-hmm. Yeah. Yeah. Okay. 'Kay. It's open already so you can use to find yours. F\_ five. Go Jurgen. You pressed alt F\_ four? Oh great. Yeah. Uh maybe you can do it from your computer so talk us through it. Yeah. That's nice. F\_ five. Yeah. Mm-hmm. Mm-hmm. Mm-hmm. Yeah. The mm yeah. Yeah. Mm-hmm. Yeah. So n it's very easy. Now yeah it's okay. Okay. Yeah. Yeah so maybe you can hide them or something. Yeah you make a screen menu or something. Mm-hmm. Yeah and the other oth other uh functionality is the screen. What does the screen do? Yeah. It's low power. So what does the screen do? They said they needed it but what does it do? What do they want with the screen? Yeah that's what we make it up. So but what did the marketing No. Yeah okay it's handy. With no predefined uh We're back online. Okay. Mm-hmm. Content and form. Yeah. That was the end. Okay. Uh which one is it? Technical functions? This one? Functional requirements? No. You didn't put it in? Or it's not really English. Uh kick off. Oh working design I got it. Here you go. Just uh press uh yeah. Yeah. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm. Design yeah. Mm-hmm. Mm-hmm. Yeah decoder. Blank. Yeah okay. Work harder. Yeah. Uh 'Kay. Um for those that didn't see yet um the basic new requirements of the management were no teletext, only for T\_V\_. Uh it should be designed for a use g uh group below forty, but I don't think it's w wrong if we can uh target the current customer group as well. And uh the corporate identity should be clear in the design of the remote control. And we have to decide on the functions, and on the, let's see what was it, uh the target group. We have to make be clear what that is. Yeah users. Yeah so I think it's easy but Yeah it's below forty so we can decide where to Okay. So below forty is okay. But we need an lower level which to s uh focus. So is it from sixteen to forty? Is it from twenty to forty? Is it from thirty? Yeah? 'Kay. Yeah. Mm-hmm. Design. Mm. Mm-hmm. And maybe y Yeah. Yeah. Yeah. So is you should have a menu for all the the functions you don't use regular and which are Yeah. Aye yeah. Shall I uh Yeah. It's okay. no, it doesn't have line control, so Yeah we get the The remote, yeah? Basic. Is on top. Which should be easy, easily reached with the thumb. T I s should said right. Because yeah. Mm-hmm. Do the also with the thumb. So it should be a little bit longer so that you can put your uh thumb, also reach the middle. Or you should screen at the bottom and then you can see it very clearly. You you need to be able to hold it so Yeah. Yeah okay that's true. Layout. That's for the I can't help it. Yeah. Man. Yeah okay. You want the normal piece of paper? And you have a pen? Yeah? Mm-hmm. Uh. And the for flipping up and down. Yeah. And left to right. And those can also be used for the menu. Yeah. Yeah okay but this is f

unction so if you can use them for multiple things For the menu. Yeah. Mm-hmm. Yeah. Yeah. Yeah. Yeah. Yeah but that depends on where you put the screen. But it's essential that there is a screen. Yeah. And for the speech uh recognition part, if we want to incorporate that, we need a microphone. Yeah. This would be uh No that's not s sure so uh we need a display. Yeah. Yeah they're used to it. Mm-hmm. Yeah but then it's possible that you cover it with your hand so I think that top is the best option. Yeah okay. Depends on the sensitivity of the microphone, but I think that's okay. Volume. Up. Channel up and down, and the control of the advanced options. So maybe it, we should decide what advanced options we want to put in the L\_C\_D\_ screen. Yeah so sounds? Yeah and they're They're not used often so Yeah just Yeah sounds. Yeah. Of course. I'm just a secretary. Coffee? Treble bass. Uh Pitch I believe, yeah. Yeah. Yeah and mono stereo. Mm. And also the tuning part? Yeah programming. So channel programming? Mm. Yeah. Contrast yeah. Mm. No. Uh, so contrast, bright, uh And the others were in your presentation right? So I can just copy those? Okay. It's easy. Yeah the button options and the L\_C\_D\_ options. Indeed. Yeah. Yeah you have basically a button menu, which you can use directly, uh according to the old principle. And the L\_C\_D\_ options are activated by some

some software options, that's communicates with the infrared uh decoder yeah. So you You have an additional processor and and software part. Compared to o Mm-hmm. L\_ s Yeah. Colour. Yeah I I call it contrast. Yeah I make it c colour. Yeah. Yeah and automatically um Mm-hmm. Yeah so I've g channel program is autoseek? Uh name a channel, or Oh they get automatic names, okay.. Yeah. Yeah but can you also say I want f uh Veronica on the channel number uh five or Yeah. Yeah. How do you call that? Channels? Yeah. Ninety nine or something. Yeah. S swap channels? Can I call it that? Swap's good option. Okay. Uh other functions? Mm-hmm. Okay. Well that's 's up to uh Mister User Interface Designer. Also. That's you're Yeah but also, which buttons you have to press to get a certain result? And the working design was to specify how ph the physical interaction between the components was, as I believe. No I don't think so. But I think the communication with the television is difficult. But that's not our part. We don't have to design a protocol so No that's the Yeah. So but Um The User Interface Designer can design a menu for all these function I put them on the. Yeah. Yeah I can. I'll just try to reorganise uh things. Um So you design the basic function menu for the L\_C\_D\_ screen? Uh um I think th I think the yeah the layout of the screen and I think you can concentrate more on the button placement and the placement of the uh screen itself on the. No I d I think that's more in. Yeah. Okay. So he's layout and you're function. Form function okay. Yeah. I think i that's your department yes, because w he already knows what Yeah. But we're not allowed. Yeah. Yeah. Yeah and also make clear which buttons to press to get certain result, because that's always the difficulty. Every device has its own Menu okay. Yeah. Mm. Back. Yeah. Yeah but they're incorporated? Up and down is Smart? Put it on top. Mm-hmm. Well But that's uh J Jurgen's department. You just make the layout. You do we do the extra two buttons or not? Yeah. Yeah okay. That's true. And to, okay and back, also. And of course the four arrows. But those are still y doubly used. Both the L\_C\_D\_ Yeah. Menu button access the menu in the L\_C\_D\_ screen. You can navigate. But you can also navigate the channels. And the volume. Those are both both yeah. Oh five minutes. Light uh Yeah sure. Okay. Um Anything else? I've Volume. Well we have those buttons. We use all four. Yeah okay go ahead. Yeah that was already decided. Okay that's what we decided earlier on. Right okay. So yeah I wanna close down. I have to, sorry. it's not because I don't like

you but yh we have lunch break, and then we can work for thirty minutes, and I have to write very fast to make the minich min minutes. And then uh we'll see I don't know. Nobody told me. No I th believe there's first lunch break. Yeah. Or you can just Yeah? 'Kay. I think you can put uh the laptop back in the room and 'Kay. Yeah it's a lot of pressure. That's okay. Oh yeah. I don't know if it works but it should be saved. Yeah. It's uh Should be here. Smart board. Don't know if you can use it but Yeah. I try to organise it by these three. Yeah yeah yeah. I don't really mind. I just put the minutes here and we'll see. Yeah that's in the functional design uh folder. Yeah. Yeah that's just basically what I just showed. Yeah. Yeah I got it by yeah. I'm gonna get kicked if I don't do it so Make me proud. Yeah. I believe so. just ask. Hello. 'Kay. Newsflash? D did I miss something? Okay. No. Mm. I think you have to uh change your desktop uh size. computer is uh not functioning? Uh display. And then uh settings? Mm I'm not sure I. No. Okay. Format. I made uh uh my own map. It's a Yeah. Yeah. Yeah wa wa you actually Yeah. But it's not clear what you have to to type uh type in your presentation. Yeah. Really. Okay. Yeah. I was wondering uh But you you've got more information than uh. But where did you get uh that information? Okay. Yeah. Yeah. Okay. Mm. It's F\_ five. Okay. Oh. What is this? Oh no. How do I uh No no no. I pressed the mouse button. Yeah. Okay. Okay. Um if you all go stand around uh Computer Um No. Okay. I uh had uh two examples. Um this one is the the yeah the advanced one with a lot of options and functions and buttons. This the easy one I think we have to to combine them. And uh yeah merge

the best functions of all examples. Um but yeah the the age is uh under forty? So we Okay so so we have the option for more functions. Um yeah. Yeah. Uh yeah this this one we can remove for kids. It's just only for adults so uh we can uh use some advanced options. But Yeah but I prefer we we uh use the the basic options uh yeah. We have to to make them very easy so for just uh zapping around the channels you can just push one button. But if you want to to use your your video recorder or something else, you should use use an uh an advanced option. Okay one device. Okay. I didn't see. Okay and I also uh yeah. W yeah. We have to make it fashionable. Like you uh said uh before. Uh yeah the basic functions. Um yeah only use a extra function if they are really needed. Yeah. Yeah. Yeah. Did I uh did I break it? For for the advanced functions I think. Like searching for channels and Yeah. Okay. That's uh I'm al I'm almost finished so Um the we have to to to watch out for the i if we make it f very fashionable, it it the functional functionality will go down. So we have to make uh a compromise between functionality and fashional fashionable yeah content and form. Now that that was uh was the end. Yes. Yeah. Okay shou should we make a list of the of all the functions we want uh Yeah. But uh it's it's also for children or just uh Okay. Okay. Yeah. We we have to And if we have a larger public we have uh yeah more options to to uh sell our product. Yeah that's that's why uh I wanted to to make yeah two uh different uh yeah groups of functions. The the simple functions for for the the whole public, and the the advanced options for the younger people yeah who are more yeah experienced with uh Na I w I should uh put uh the the yeah the extra advanced options on the onto the onscreen display. Yeah. Yeah. Yeah. L left top or right uh top? Yeah, right. Okay. Yeah but if you are using the the normal functions, the the basic functions, you normally press them on the u yeah. Yeah. You broke it. Yeah yeah. And volume control. Yeah. Yeah. And do we need a a logo on our uh remote control, or On the left uh top yeah. Okay. Yeah may maybe because you're Yeah okay but only for the basic functi if you're going to use the advanced option, you're going to pr

ess the the menu button and then yeah. Yeah. Okay the yeah. That's possible. Yeah, okay. Okay we put it on top. Yeah. Yeah. Yeah. If we Yeah it it's just a remote control so Yeah. Television uh itself uh Mm. We we could make an option for it, but uh you can disable s Yeah. But uh the the television itself has also the the options brightness and uh screen colour etcetera. So yeah. Okay. Yeah. No that's Okay On the uh yeah can you i make a a map with with all the yeah 'cause it's now there are lots and lots of documents and The the layout of the remote control? Isn't that more the the u uh the user interface part? Yeah. But do I have to to uh to yeah to make the the menu layout also? Or Are you going to do that? Yeah? I I'm going to make yeah o okay. Yeah. Yeah. Okay. Y you you are going to make a list of what functions are uh are going to to be on the the screen, the menu screen. And I'm going to make a a nice menu uh with with pages and yeah. Yeah. Yeah. W we Uh I think we have to to group, to make two groups. Um the one group for the for the display, and one group for the basic functions, and Yeah okay but we we have a m yeah but maybe that's that's not uh yeah if you're if you're z zapping uh with your uh yeah remote control, you can press the the menu button, and then you are suddenly into the the yeah the display. Yeah. Yeah j just just group group the yeah we make these the advanced functions and these the basic functions. So we make a yeah a line between them. F oh yeah. Okay yeah we swap uh Okay. Yeah. So we make it a Okay. Uh Yeah. So we have a a menu button and a s Okay. Okay and back button. Yeah I'm I'm not s clear about uh the the extra two buttons. We have a menu button and That's the the one with the yeah okay. Okay. Okay so that that's not uh Yeah that Those are multifunctional. Yeah. Yeah. Yeah. No Yeah. So maybe make one uh one okay button and and one navigation button. Yeah the with with the the channel and the volume uh yeah m a multifunctional navigation button. Yeah okay. Yeah. But do we have to write uh to write down uh the our

stuff now? Or first lunchbreak? Because I I've everything in my head now so Okay. Yeah. 'Kay. Yeah. Yes sir. Oh no no. Okay. And uh we have to make uh some maps with uh with the all the the data we uh gathered.. It's it's just my own map so I put everything into the But you got some extra information uh Okay. But where do you did you get the newflash? You're the only one uh okay. Okay. Yeah. . It's I don't know. I didn't see it yet I think. Hey what's wrong with my computer?. Huh? What the Not really. Sorry. Okay. Where do I find this? I'm not so g display huh? Appearance? No what was it about? Yeah my computer is not functioning properly. Yeah yeah. No but my screen is reduced in size. Yeah. Feedback. Okay. This is dreadful. No not this, but the task. Yeah. No that's okay. No I just flapped it, closed it, took it here and then this happened. Ah. Uh where was it? In settings? Okay. Alright. Thank you. Do you guys like your tasks? I spent a lot of time thinking about what I was gonna do and then a couple of minutes before this I get my function you know the information that I need. So frustrating. So Yeah Yeah exactly. This presentation is mainly based on my own ideas 'cause I hadn't time to intergrate tha the information yet so Really annoying. Yeah. Ts So they do need to be in the Alright. By the way my T\_V\_ doesn't have an equ equaliser but okay. No. Alright. By the way where did you guys get that newflash from? I didn't get anything. Alright. Do we have uh yeah. Alright. It's th that's the self-destruct button. Alright. Mm-hmm. And we do have to integrate the screen and the the speech alright. Mm-hmm. Yeah. Alright. Ah look. We have your uh oh never mind.. Okay. Well my presentation is a bit uh sucky. Yeah a little bit. Uh no. No no. Yeah I think that would be it then. I have no idea. That w. Let me check. I know. Yeah. Alright how do I uh skip pages? The keys yeah? Alright. U

m yeah well I was working on this before I got my information. So I was just working off the top of my head and using my colin common knowledge about uh remote controls. And well the info on the website which came too late. Um so I didn't really know what kind of functions we had to put into it yet. So uh uh this is basically an overview of what we discussed in our last uh meeting. Those were my uh starting points. Uh I was working on a s yeah on a schedule, and I was supposed to do it like this. But um yeah then uh the information came and it was kind of exact with all the steps in the remote control that I had to follow, so I was trying to organise them for myself. And then make the the design, a the actual design, but I never came around to do that. So I'm not really sure what I'm supposed to say about it. I mean everything speaks for itself I guess. Mean you press a button um the it tru goes, it sends a signal to a chip, which uh translates it into infrared signal of certin spatial frequencies. And uh or temporal fr frequencies actually. And then uh through a uh transformer, it the signal gets boosted and then sent to the to the receiver on the T\_V\_ and the T\_V\_ will translate it into a function. Um Yeah well this was actually all I got around to do. I mean I dunno if I'm too slow for this stuff, but uh Yeah. Whatever. Yeah so what we might wanna do is uh yeah cust I have customised the screen functions, if you know what I mean. The uh younger users are more acquainted with these kind of machines so they can use more advanced functions. But maybe elderly people don't understand it so well, so they need a simpler remote. And yeah that you can choose what the design displays, or wha whatever. Yeah. Experienced yeah. The remote? Right top. Yeah definitely.. And might be easier huh? Yeah I Yeah exactly. I thought but this is really your department, that we need just the functional display and four cursors. And Yeah okay. Yeah. Mm-hmm. Why did we wanna put the display in the bottom? Okay. Because yeah if you use the functions your hand will block the display. Normal for logical t Yeah. On once it's on it's on. You don't need the power button. Yeah. Maybe on the top or even on the side. True. But if you uh if you hold the ma the remote like this, if you put it on the top on the side I dunno. Should be able to work. Never mind. Can we leave this up to you? Yeah so we we needed to integrate the sound and uh and image options right? Like uh bass uh so we need kind of an equaliser. If you Yeah

treble, middle, bass or something. Ah as.. Yes please. the mono stereo option? And there there was something else also. And then pitch. The frequency of the tones, yeah. Yeah isn't that that depends on the signal of the of what program you're watching. And yeah in the functionality of the no no of the remote uh do do we want uh the buttons to make sound when you press them? As a confirmation or whatever you know? I dunno. Under the a yeah advanced option menu you can put those things. Yeah. But so we have we have T\_V\_ options, which is all this. The sound, sound and image. And you have in that uh the indeed the remote control options. So we need two menus kind of thing. Uh-huh. Alright. Help. working design. Doch. He only has to figure out how it has to look. And how to use Yeah okay. But You did your homework. But um yeah. Okay. No no. It should be able to do any remote. No. Thank god. Uh all the functional uh aspects of the remote I think are in my department. I have to know what it has to do, so if you wanna you know the changing the channels kind of s thing is, I have to integrate that in the design. Yeah. I think that's a that's a good separation. Mm. Yeah we have to kind of work together. If if I make the the the yeah the menu like, I have to state which function has to be in the menu, and then you have to decide, it's, in a in a way that b is user-friendly. Yeah. I think yeah. Mm-hmm. Yeah. You wanna separate uh

. I think you should. It's easier. If you put too many functions in one button it gets confusing. No. Hey is it interesting for users if we put LED lights under the buttons? So that if you uh press on the menu function that only the buttons that are used for the menu are light up. N Yeah and then it's also easier to integrate several functions in one button. I think not. Yeah keep it optional 'cause maybe you can you know go left to right and up and down in a in one menu. The problem with the okay button in the middle is, sorry sorry, uh is uh if you're pressing up and down, you can easily press the okay once you, when you're not already at your choice. You wanna close down huh? That's okay. Already. Alright. How m how long is the lunchbreak? Okay. Mm. This is Yeah. Sorry for my uh not finished presentation uh. Bring it on. Alright. I'll try to. So first we have a lunchbreak now? Alright. Mm-hmm. I dunno where she. Yeah I I just saw it one minute ago. When I uh Yeah. Yeah pretty much. Mm. Yeah that's my presentation. Mm? Oh right. Ooh. Well Alright. Huh. You read the newsflash? Hmm. What? Hmm. alt delete.. So it doesn't draw the attention away. Yeah. Yeah. Yeah. I I had a whole idea and then just was typing it and then oh. I have to do that so switch. Mm. By your humble P\_M\_. Yeah that's fine. We have to start it right away? Functional? Yeah functional requirements. Alright. I'm gonna talk about functional requirements. Um Well uh some research has been done uh has been done. Uh observing of one hundred uh subjects in the usability lab using a remote control. Uh and they also filled in a questionnaire. The findings were um, well you can see them for yourself. They disliked the look-and-feel of current remotes controls. Users think they're ugly. Um they do not match the the operating behaviour of the users. So they they d they don't match what they want to have on it. Um they are often lost somewhere in the room. Um it takes too much time to learn how to use a new remote control. And they're bad for R\_S\_I\_. I don't know uh how a user can reach that but okay. Um there is also uh was also some research on uh the most relevant and and and irrelevant uh f functions. Uh most irrelevant and less used were audio settings, mono, stereo, uh pitch, bass. Um screen settings for brightness and colour and stuff like that. Um but they are used. I mean the Yeah they do need to be on the on the remote control. I mean if you can't control the the sound settings I mean if you dislike a very uh loud bass or something, you you need to change that. So um yeah we have to. We c we c Yeah I mean w we can't my my T\_V\_ has, but we we can leave them uh away. Uh most relevant, uh most used functions, uh they speak for themselves I guess. Uh power button, uh channel, volume selection. Uh teletext but we can skip that because I saw the newsflash, and teletext is so outdated that it it's i

should not be used uh any more in the future. So forget this one. Uh channel settings, so for programming uh your channels in in the right order. Yeah, on on the project uh No so it's a text file n in the project folder. So teletext can be skipped. Um there was some research on new features in a remote control. Uh about an L\_C\_D\_ screen uh and speech recognition. Well we got an update for the for the audience. Or the the the targeted group. So it's above forty I guess. The new product? Or below because that's pretty relevant. I thought I read a Yeah? Below? Okay well that's that's in the newsfla okay that's a good to know. Um because you see see a clear distinction between the age groups, concerning the features. I mean uh above forty people are not so interested uh not so interested in a screen or speech recognition. Uh but below that age they uh they pretty much are. So I think we can build that in. Um Yeah well we can skip this part as well, because I thought I read above forty so we could skip the features, but we just have to build them in because uh they

find it very interesting. Um well we have to keep all the classic functions but make the buttons as user-friendly as possible. Um and and also there's so not only the design of the bus uh buttons but o how you can push them, and stuff like that. So the physical uh aspect of it. Um And I think and certainly for for the for the lower age groups, uh nice design, which uh does not make the remote control in your room. It's it's actually a part of your interior, of of your design in your room. So it's the people can say, well what's that, well that's my remote control, so it's d it has to look nice and feel nice, and and have all the functions that uh Yeah so the the logo has to be uh present yeah, and the colours as well. Yeah so but I I don't think that's that's a problem because the thing has to have a colour anyway, and most of the times there is a brand present on it. So I think that's not gonna gonna affect it very uh very much. Well that are the the consequences uh on a marketing uh part. Yes.. Yeah. Just yeah. Sure. Yeah. Alright. Yeah. Yeah. Yeah and and and marketing research stated that that that kind of users are not afraid of of a lot of functions. So not not too much but yeah. And the speech recognition yeah. Yeah from age of sixteen so yeah. Mm. Yeah but uh the the newsflash also stated that it should control only one device, only your television. So w So there are not extra options in this case, but uh Yeah. Yeah. Yeah well what what we can do with the screen is is all the the configuration options, you can put that in the screen. And the and the yeah screen menu to to to uh to do that, and then the basic function just on the device itself. So it looks very simple and all the advanced features are hidden in the screen, uh with a clear menu. Uh. What are wh What. Yeah well it yeah it didn't it didn't say what they want to do with the screen. Well I, my guess is it's it's pretty handy for advanced uh advanced functions. Yeah searching for channels, programming them. Yeah. Yeah. Well you can improvise right? So we we can go for So we can go for the look-and-feel of the the left example, and then a screen on top of it. Yeah. Design? Yeah. Okay. Yeah frequency. Yeah. Yeah. Yeah we want to incorporate in uh into it. Mm. group of users, or because it says below forty I mean. I guess that's that's the tar yeah uh or male and female Uh six the marketing research started on s on the age of sixteen. Sixteen to twenty five, twenty five to thirty five, thirty five to forty five, something like that. So um How do you mean? Uh sixteen to forty. Well I I guess people of sixteen are are quite used to technology. So they they adapt to it pretty soon I guess. Yeah. But uh all incorporated in the screen or or just on the remote itself? Yeah like like you have a visual of the of the brightness with with a kind of sliding bar and a bus and and stuff like that for sound and and vis and and visuals? Uh you can make a if you make a drawing. Uh Uh. Uh black's okay. And draw it very big. Oh. Yeah. Yeah. Yeah well, this is basically uh it's alright the remote? Um well usually the power button is on top I guess. Yeah so it should fit right in into your hand. Right. Right. I most people are right-handed so maybe left-handed special addition, but okay. If you put it like like here. Or something. I dunno. Um then you could put a screen, like on a mobile phone, also on top I

guess. Okay so y yeah you have you have it in your hand, and the screen is below, and the buttons are in the middle. Okay for example if you put the screen here, it's more about the functions now than the layout. Doesn't work too well. It's uh it's bent.. Yeah. Right. Okay you get it. Uh for example if y if you put all the Right. Yeah. Maybe this. kind of works. Like if you have like uh ten buttons for for all the for all the channels, um and here one for for Yeah that that usually uh like here, here, here, here. So you have up and down for the for the channels, and I

eft and right for the volume uh Yeah. Yeah. And you you have most of the time you have one button in the middle. It says menu, and then if you press it you the screen gets activated and then you can use these buttons to scroll up and down and left and right to go into functon and then just mo most of the time this menu button is also like okay, to to confirm a a kind of action. So you scroll into it, okay. You select a function like v like uh bass. You just adjust it with these two buttons. Then okay to confirm, and then uh on on each on each screen there's there should be an option to go back to a to a upper level. And then finally say okay, exit. Or or one button to exit it. Uh in one time I dunno, that's not really my department. That's more your uh your department to to uh to Yeah. But it should be if the screen is here then the logo should be like on on top, yeah. I mean it's uh Yeah. Yeah I mean the position of the screen is also more essential than I mean we we look where we have space left and then put the logo over there. But um Yeah so it should be I mean if you have it in your hand here, should be on top somewhere, maybe. I mean i That's not sure but it's Yeah I mean a screen on top looks more lo logical to me. Also because people use m mobile phones and they also have the screen on top. So you you just have to reach a little bit for the power button. I mean if you grab it. But most most of the times if a if a T\_V\_'s on standby people just press a channel to put it on. So we put this on top, and then make the corporate logo like over here. R\_R\_. And j and the microphone, I mean it can be very small. If you look at your mobile phones are some stripes, little little holes. Yeah maybe on the side. I mean if the if the microphone is good. Yeah okay. So on the on the top is better. Yeah.. Yeah it doesn't matter that much. So but um the screen is on top? Which functions did we have left? I mean this is basically numbers, volume, uh channel up and down. Screen is over there. Yeah. Yeah. That's uh that's a good one. Yeah. Sound? Yeah. Equaliser. So if you have sound But not too advanced. I mean most T\_V\_s use only treble and bass. Yeah. It's uh pretty hard to write. Mm. Okay but you have sound? Yeah just oh y you have digital uh better write it down over there yeah. So you have sound. Yeah. Uh yeah sound and then within sound I guess treble and bass? Yeah. Also. Pitch. Yeah. But pitch, isn't that yeah that's the the height of the tone. Yeah okay, wh why would you use that? If people like talk like uh Yeah. Programming part. Uh so we have sound, yeah? Channel programming. Mm. I think it g it gets annoying. I mean most mobile phones used that in the beginning but Yeah. Yeah but people don't want to sit on their knees on their knees in front of their television with only three buttons then it's very hard to y yeah contrast and brightness? Yeah those are the most used I guess. If you look at your monitor. Well yeah well I guess that these were the only ones, I guess. Yeah. I will look it up. Yeah with the chip and then I mean Uh yeah. Well yeah we have power button, whether that's present. Channel volume selection present. Uh numbers present. Yeah a audio settings, mono, stereo, pitch, bass, treble. Screen settings, brightness and colour. Yeah con contrast is Yeah okay, colour and brightness. Um and what you say, channel settings or channel programming? So you you have an option to to start scanning all the frequencies, and when it encounters one, well it shows on your T\_V\_. And then you can um Uh and then you can select uh a number in your remote on which you want to save it. Yeah, autoseek. Well most T\_V\_s automatically display the name, which they get through the cable. Yeah. So you only have to choose the position on your It only has to match the the channel frequency on your

T\_V\_, with with the with the position on your T\_V\_ and and so your remote. If you already programmed it. If you want to move it. Yeah that should b

e possible too. Yeah how do you call that? Mm? Wait you you should be able to to browse through a list or something, which w displays all the all the values, all the channels which are possible. I mean like one to f thirty of or ninety or whatever. Just browse through it and then um in some kind of way see if it if it if it is programmed. Yeah. Swap channels. So you most of the time if you if you swap it S uh let's say for example you have uh R\_T\_L\_ five on on channel five. And Veronica on channel eight and you want to move Veronica to channel five, um most of the times you override the previous uh the previous one. Yeah. It's it's pretty uh yeah I mean you have to look on on the menu on the T\_V\_. Yeah. Or or is it too hard to to ju to just do it all on your remote? To programme the channels? Uh. Yeah. No. That's true. That's true. Yeah. So we have a figure a figure out a way to to do that easily. I mean th the autoseek is is not a problem. I mean you uh you uh current channel and then then it just says, uh on which number do you want to save this, and you just press a number on your remote, and then say confirm, okay, and then it's it's saved. It's easier, it's it's it's harder to, if you have already programmed it, to to swap. So we have to think of something for that. Yeah k kind of structure into layers. So And and the layout of of the thing itself.. Maybe more on Okay. Yeah. Yeah I guess so. Yeah. Yeah. With with some I with some layers in it. So some menus. Yeah. Yeah. Well I guess this this button, the the okay, menu okay. Or you can incorporate two uh difference uh different buttons. Uh like uh for your mobile phone. Um so this is only for to get in the menu, or to exit it. And then one to confirm, and one to go one step back. So it's like the the save button on your your mobile phone, if you have a Nokia or like that. Or the or the no button. To go one step back you it's only two extra buttons, but if it if it's very clear that they are for the screen Yeah because this this is used for both. Into your screen. Okay. So you I should leave the menu button out of here. And and just put it under the screen, the screen Yeah. But we should place the screen on top, right? Yeah. Yeah. You just you just find out and. Yeah. Yeah. Yeah, or confirm and back. Whatever. Yeah. Should we save this picture, or or you know what it looks like? Yeah. That that just to to activate the screen. So And then with these buttons, woa, y you navigate. Yeah. L I litten up yeah. That's very good idea. Alright. Yeah that's a good idea because then it becomes clear which buttons are active now, which you can use. Yeah. So Those buttons are are lit up. But just one thing. Should we use those two? Them? Or only this to to scroll? And then use the two functional buttons to confirm, to go into something? Oh no we have to use this to adjust some some bars? Yeah. And maybe we should use this also as an okay button, still. And then just only a back button. Yeah? Yeah. And one back. Yeah. Yeah. Yeah. Yeah. We have to ask. Yes. Yeah. Time pressure. Yeah we'll kick your ass later. No. Uh. Aye Y you saved it? Does it save automatically in the project folder? Or Okay. We'll see. Just put back my laptop. Alright. Yeah you can open it with the picture preview or stuff like that. internet. Alright.

# Meeting ID: 124

Data Source: Train

## Executive Summary

I take it you all have received instructions as to what you were supposed to do I think the Marketing Manager probably should go first , addressing the needs and desires . Um I thought that the method I should follow would be gather suggestions from everybody , um and then as we go on what we'll have to do is accept and eliminate these suggestions according to um design and budget feasibility . So I'll be coming to you um frequently as the Industrial Expert to tell me how hard it's gonna be to add a feature or how expensive it's gonna be or if your time , if it takes five years to develop this it's just something we can't do . because if we're gonna sell this thing , I think the best time to sell it is as a Christmas present . So it's gotta be really attractive Um and then I'll be coming to you as the User Interface person to try to tell me from your point of view what are the most friendly features that we could put on it what what's what's gonna really be what they call a sizzle , A lot of times the thing that works the best from an engineering point of view isn't the thing that somebody's really just gonna take out their wallet and buy for Christmas for for their child or for their husband or whatever . Alright I I already did a little bit of research after our first meeting where we threw out some ideas and it looks to me that within the budget that we're looking at the uh the whole house idea really isn't gonna be possible . And then I found on the internet from from my research that some extended electronic entertainment control should be possible . At the budget that we're looking at and at the price point we're looking at , we should be able to make it work the T\_V\_ , the V\_C\_R\_ , the stereo set um maybe something else cute like a coffee pot or one other appliance or maybe a lamp . Uh okay , can can I at this point interject um something ? Um we have received instruction from higher up that certain things should not be uh considered . Um the one thing for example something to eliminate maybe that's the teletext , and according to to higher management the it should only control the T\_V\_ , and the third thing that they wanna make sure um that their that the corporate image is being maintained , and that the corporate colour and design are being used on the product , Um alright now other things that I found out on in my research is that the complaints that people have about the remote controls that are out there now . 'Cause a lot of them take too much time to learn how to use , but even more important the thing that we did address in our last meeting that frequently it's lost somewhere in the room . uh we wanna s make it as simple as possible , we wanna make it um obvious and intuitive to use , we talked about the a light emitting thing as well as uh maybe a beep , Okay , so , my personal preferences in this um project are really have to concentrate on the

sizzle . We have to have as few buttons as possible , because more buttons is more confusion , So we've gotta concentrate on the features that help you find it , Um and then maybe a motto , like we put fashion in electronics might be something we can use in our marketing campaign . Uh so today I'm going to talk about the working design of the remote controller . in a remote controller you have a chip integrated circuit which is like a brain of the remote controller . It takes the power from a battery and it takes the input and it transforms into an infrared signal and it sends it into the device , like a T\_V\_ or an air conditioner , something like that so . and uh so uh I think it's hard to design a remote controller for multiple uh devices . Yeah well that's already been eliminated by management , so we're off the hook . So uh user interface controls the chip and accordingly the messages it's like the text or buttons which uh which are there on the uh remote controller they those we can make uh um like fluorescent if suppose a child is playing with the remote controller and a and she she or he is pressing the buttons all at the time then there should be a beep saying that it's this this is not a a you know a a action , there can be no action taking to that so . like uh uh you should be able to lock your remote controller so that uh um whatever buttons are pressed by a child they can't be like y you i you if you have ki kids and all then they'll be pl playing with the remote controllers so can lock the remote controller . And uh different shapes that we can do like uh we can have you know a all animals shapes or you know comfortable uh whi which can fit into your hands you you say that won't add too much to the budget ? No no no , it won't uh I don't think it will be like , Do you think there's any chance of um having ser in having basically the same machine with the same buttons but maybe several different shapes ? Because we had something sort of sexy for adults and we could have something sort of Silly for children . so I think uh we need to make some buttons which are which are like um uh f in uh in intended for two or three operations , And and the butto buttons also I think if you want to have more features in your remote controller then there should be more buttons . because I think there's a lot of argument to be made for one button for one feature . So um maybe having buttons be various shapes might be a help too . You know , like the a triangle is for the volume and a square is for changing channels , so that people can uh develop a tactile sense of it . And uh display clock i if you want more features then we can display a clock And uh uh of course there should be a case where we can keep all the things As uh User Interface Designer I did a little research to find out what are the features which a user would like to have on their remote . uh something like a radio wave or an infrared light or a LED which can be used to change the different functionalities in the television Now there should be some timer to set for viewing a particular a particular programme or switching on and off a uh a particular programme according to the user choice . and then there should be a child lock system if a particular channel is not to be viewed by a particular uh for a certain age , then the parents can lock that particular channel so that the ch children cannot view that channel . one of the feature a user would like to have is the compactness of the co remote . and it should ha it should have as many buttons as possible for controlling different functionalities of the T\_V\_ television . And it should have an uh it can have an alarm clock and then to save electricity uh there should not be uh much s move uh lots of circuits and all that . And um uh as uh uh this is my personal preference that it should be in the shape of a T\_ in alphabet for more compactability . However uh the decision we have to take in this meeting is who is our target group . And uh what function , working design , how how does it work . Now , talking about the target group which is in a sense everybody , but I think within the target group we have subgroups . we have earlier it was

mentioned about um for example elderly people who have limited function with their fingers and hands , And uh I don't know how much we want to cater to children's use . and um I dunno what you feel about whether we can just say we have one target group and for this one target group we're gonna design this one thing So if you've designed something that's very attractive to children um the mummy please mummy please um you know we want it now we wanna go to the store and see it um that has uh a lot of marketing pull . I think the children issue can be addressed with the shape and with colours . The question is only whether our budget will allow to have more than one design in a sense . but uh the target group as a whole is basically everybody with a T\_V\_ . can we is it even feasible to make one one remote control with something for everyone , or would we have to use the same electronics and make three different shapes ? They have like removable plastic cases , so you can have a striped one or you can have a fluorescent blue one , or whatever , that in each package you know you have you have you have for example uh you have let's say a fluorescent blue on it but then you have uh another colour or stripe whatever that already comes in a package . Well we may have to come back to one or two of these points at our next meeting but um If we do some more research , maybe we . If money permits we can address some features for some subgroups within that . Do we agree on on that in principle , like money will tell whether we will be able to do that or not . So now I understand it's lunch break . I I think to sum it up the target group is basically everybody .

## Complete Meeting Transcript

Okay, is everybody ready? Mm-hmm. Um I take it you all have received instructions as to what you were supposed to do and um I think the Marketing Manager probably should go first, addressing the needs and desires. Yeah, mm-hmm. Okay. You're participant four. Okay, and now I can uh full screen. Uh, okay, okay. Uh okay, can can I at this point interject um something? Um we have received instruction from higher up that certain things should not be uh considered. Um the one thing for example something to eliminate maybe that's the teletext, because that's sort of outdated with the internet, and according to to higher management the it should only control the T\_V\_, mostly because they feel that it's too comp complex a task to um to to include other things, and they are concerned with the time to market. Okay. Um and the and the third thing that they wanna make sure um that their that the corporate image is being maintained, and that the corporate colour and design are being used on the product, so that it's easy that that that they can be easily identified as a product of of of the company, and that there's no mistake that it could be somebody else who is bringing this out. So I just wanted to interject this here so we're not getting too much off track here with uh with the things we wanna look at. These were instructions from higher up so we have to eliminate uh these things, so it's only gonna be T\_V\_, but the one thing maybe that could be um eliminated is the teletext uh idea. Mm 'kay. Okay. And uh who would be next, uh, I guess that would be you. Mm-hmm. You want me to get your slide show up? Mm-hmm. And you are number three? Number two. Okay. Okay. Mm-hmm. Yep. Yeah yeah, uh-huh. There, mm-hmm. Mm-hmm. Mm-hmm. Yo and it's yeah but it's so. Yep. Yeah well yeah well that has been e that has been eliminated, so that's that's unfortunately a moot point now. Mm-hmm. Yeah I It just build a mould basically and uh you know. As the budget we're looking at if you

build one mould I don't think that's going to make a big difference whether it's gonna be square or Oh yes. I think I think we will have to look at the budget on that but I think in principle that that would be that would be kind of fun, you know. Yeah. Silly for children. Like an animal or Yeah. Yeah, a little elderly, a little arthritic hand you know, and and it's a small button and and it they don't press it exactly you know something else happens n not their favourite channel comes up but something else and they're very frustrated you know. Mm, mm-hmm. Mm-hmm, mm-hmm. Yes. Yes. Yeah you're sitting there already or maybe you have no other uh Mm-hmm. Yeah, mm-hmm. Mm-hmm. Yeah. Holder, yeah, mm-hmm. Mm-hmm. Okay. Well, you don't have to. This one? And Francine? You are number two? You're three. Would you want it full full screen? Mm-hmm? Okay. Mm-hmm. Mm-hmm. Mm-hmm. On the on on the remote. Yeah, mm-hmm. Mm-hmm. Mm-hmm. Right. Mm-hmm. Yes. By your child, mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Timer, yeah, mm-hmm, mm-hmm. Uh okay, now I have On my slide show basically we already we have already done the agenda, and uh on the closing uh basically there will be lunch break and all that. However uh the decision we have to take in this meeting is who is our target group. And uh what function, working design, how how does it work. So these are the two things we should come up wit with. So uh the first thing is pro maybe a little easier on uh who is our target group. Um. I guess in many ways everybody. Everybody who has a T\_V\_. Yeah, and I think today there are probably not many people who don't have a T\_V\_. There are a few but in general not. Now, talking about the target group which is in a sense everybody, but I think within the target group we have subgroups. We have we have earlier it was mentioned about um for example elderly people who have limited function with their fingers and hands, so I think that's uh one group that's certainly importan

t. Um then we have just the nervous people who can never press a little button on anything um unless it's really very clear. And uh I don't know how much we want to cater to children's use. I mean that's a question um whether that's important that children can really use it or not. So this these are just some thoughts I have on it, and um I dunno what you feel about whether we can just say we have one target group and for this one target group we're gonna design this one thing or whether we're looking at what we like we we talking about different shapes, whether that different shape also includes maybe different uh buttons uh for different groups. Mm-hmm. That has a lot of that has a lot of appeal but I think uh I'm I'm talking about the functionality now on it whether we're looking at different groups. I think the children issue can be addressed with the shape and with colours. You know, like you make it nice and pink, fluorescent, banana colour or whatever you know yeah, for example you know. But the question is really, who is our target group. Do we look at one target group? And with the twenty five Euros you know can we can we afford to have uh I'm asking the technical people here whether um to look at sort of subgroups with maybe different buttons for each group how much would that throw us out of the cost we are supposed to respect? Right. With with Mm-hmm. Well that's that's Yeah. No The the quest the question to be addressed here is only who is the target group and how will it function, and I think the how will it function is probably the question of the buttons you know, within the target group or subgroups. The question is only whether our budget will allow to have more than one design in a sense. I mean the basic design I understand will be the same, but the question is how much will that set us back if let's say uh forty percent we make large buttons and the rest we make regular buttons for example. So that remains to s to be seen but uh the target group as a whole is is basically everybody with a T\_V\_. Yeah, well that's that's the question. Well maybe there's there's an idea you know t the new for example new portable phones? They have like removable plastic cases, so you can have a striped one or you can have a fluorescent blue one, or whatever, and maybe something like that, that in

each package you know you have you you have you have for example uh you have let's say a fluorescent blue on it but then you have uh another colour or stripe whatever that already comes in a package. And then if people really want more colours they can buy it separately. You know, yes. That's right, and but like if if then everybody is is is tired of the fluorescent blue and of the striped or whatever they have as another one in the package, then they can go to the store and for a few uh Francs or Euros whatever they can buy an alternate package with another two colours in it you know for example you know. Well I think I think the idea here is to uh to to d design one remote and what the only change is gonna be um the funct d t yeah uh the functional functional cosmetics if you want to put it that way, um having maybe larger buttons or buttons that light up or buttons that are slightly differently shaped for people uh either for children um Five minutes that was I guess tha that's the old message. Finish meeting now. Um um. But I think I I think to sum it up the target group is basically everybody. If money permits we can address some features for some subgroups within that. Do we agree, do we? Do we agree on on that in principle, like money will tell whether we will be able to do that or not. Okay? So now I understand it's lunch break. And um. So that's what we will do. So hank you very much. And we'll see you after lunch. Yeah I'd to just put on my microphone here and I'll be right with you. Okay? Okay you want me to start right now? Okay. Well, could you um put my slides up 'cause I think it might be helpful if uh we looked at the

slides at the same time. I'm participant four I believe. Yes uh-huh. 'Kay. There we go. Okay well I think we have introduced ourselves, so the functional requirements are is is part of my goal but why don't we pass right to the second slide. Cause that's where m my discussion starts. Right well um since I'm in charge of trying to figure out what we should put on this thing since I have to try to sell it. Um I thought that the method I should follow would be gather suggestions from everybody, and th the reason I just put that there like that is that uh in the init in the initial stage I think I should just be open to lots of suggestions. You know you can say anything you want no matter how silly it sounds you know it should run your car, it should heat up your motor if should um turn on your C\_D\_ whatever you want it to do um and then as we go on what we'll have to do is accept and eliminate these suggestions according to um design and budget feasibility. So I'll be coming to you um frequently as the Industrial Expert to tell me how hard it's gonna be to add a feature or how expensive it's gonna be or if your time, if it takes five years to develop this it's just something we can't do. So in the beginning just have a big puddle of things that we anybody can th throw anything in and then just weed things out that can't be done for one reason or another, and then the things that seem the most attractive that to uh to a customer we'll try to then prioritise those. So that was um what I meant there, and as I said on the slide there consulting the Industrial Engineer about that and the other thing is timing is really gonna be as important as money, because if we're gonna sell this thing, I think the best time to sell it is as a Christmas present. Twenty five Euros makes a nice little present, and we want it to be an impulse purchase, we want somebody to see it and think it's, gee I just gotta have that. And take out their wallet and buy it. So it's gotta be really attractive and it but it's gotta go to market by September, 'cause anything that you don't already have out there in September showing it around, isn't gonna sell for Christmas. Um and then I'll be coming to you as the User Interface person to try to tell me from your point of view what are the most friendly features that we could put on it and try to prior help me with that prioritising of uh of the features and of the the look and the colour and I'll be coming back to you to help weed out those suggestions from that point of view. So I'll be coming to you for how much is it gonna cost us and how long is it gonna take you, and I'll be coming to you to tell me what's gonna make somebody take out their wallet you know, what what's what's gonna really be what they call a sizzle, 'cause we gotta sell this sizzle. A lot of times

the thing that works the best from an engineering point of view isn't the thing that somebody's really just gonna take out their wallet and buy for Christmas for for their child or for their husband or whatever. Okay can we go to the next slide please? Alright I I already did a little bit of research after our first meeting where we threw out some ideas and it looks to me that within the budget that we're looking at the uh the whole house idea really isn't gonna be possible. So I'd like your suggestions to come back to the other slide where I was saying we we could suggest anything. I'd like the suggestions to be really specific, so that we'll have a list of things we can cross off, not something like you know whole house control what'll be And then I found on the internet from from my research that some extended electronic entertainment control should be possible. At the budget that we're looking at and at the price point we're looking at, we should be able to make it work the T\_V\_, the V\_C\_R\_, the stereo set um maybe something else cute like a coffee pot or one other appliance or maybe a lamp. I have to wind up? Yeah, sure. Okay. Okay. Of course, ye

ah. Okay, so that's something Okay so Okay. Alright, thanks for that. Um alright now other things that I found out on in my research is that the complaints that people have about the remote controls that are out there now. 'Cause a lot of them take too much time to learn how to use, and that was thirty four percent but even more important the thing that we did address in our last meeting that frequently it's lost somewhere in the room. Um so those are two things that we definitely do wanna address, uh we wanna s make it as simple as possible, we wanna make it um obvious and intuitive to use, and then the things about finding it we talked about the a light emitting thing as well as uh maybe a beep, and I think that those are things after my research that we definitely wanna try to incorporate. 'Kay can we go to the next slide please? Okay, so, my personal preferences in this um project are really have to concentrate on the sizzle. That is the selling point, the thing that's gonna make it an impulse purchase. Uh because once there's no be-back, well in sales they always say you know, be-backs don't come back. If somebody says, oh I'll come back and get it next week you're dead. They're never gonna come back and buy it. You've gotta make it attractive enough so they buy it now now now w now is a big word in in my book for selling this thing. And, in order to make it really sellable we've gotta shorten the learning curve, make sure it's really intuitive and easy to use. We have to have as few buttons as possible, because more buttons is more confusion, so that's why I'm saying, simplicity is good. Finding it's important, obviously you can't use it if you can't find it. So we've gotta concentrate on the features that help you find it, and I've already said this several times but I put it down in writing here, it should be an attractive impulse purchase at twenty five Euros. So it has to have enough value that when somebody looks at it they say, uh twenty five Euros I'm not gonna take that. Has to be so great that they're gonna say, uh twenty five Euros isn't much. Um and then maybe a motto, like we put fashion in electronics might be something we can use in our marketing campaign. Okay that's uh about it for me right now. Okay. Mm-hmm. Signal. Mm-hmm. Yeah well that's already been eliminated by management, so we're off the hook. Mm okay. Okay. Mm-hmm. Mm-hmm. Well we already eliminated that. Now that's good from a marketing point of view, the fun the fun shape. And that you you say that won't add too much to the budget? To d the shape is uh Do you think there's any chance of um having ser in having basically the same machine with the same buttons but maybe several different shapes? Is that gonna be a possible? 'Cause that might help with the marketing. Because we had something sort of sexy for adults and we could have something sort of silly for children or a little animal shape or in a or a little elephant so they can remember where it is. Mm. Well, I think I think that that's something that we'll have to discuss um with the User Interface person because I think there's a lot of argument to be made for one button for one feature. Because I think one of the things were complaining about in my

what I found out in my research is when they complained about how hard it is to learn a new one. The changing modes was something I mean you and I, all four of us we work with computers all the time, changing modes is nothing for us, but people who N and And that's and that's the kind of thing people learn by feel, and um you don't feel the mode change. So um maybe having buttons be various shapes might be a help too. You know, like the a triangle is for the volume and a square is for changing channels, so that people can uh develop a tactile sense of it. But we'll get to that with you. That's right, yeah. Now that's a good point. Yeah. Yeah, that's that's a good that's a good one, because the clock would be really friendly, and and when

is your favourite show coming on and Yeah, and a lot of time there's not a clock on the screen, and you have to go somewhere but you just wanna look at the news for a minute. Yeah that's that's good, the clock is good. Okay. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Case. So it um we should visit this site and have a look at uh what's up there? Or Okay. Okay. So it might be helpful if we had a look at that. Okay, thank you. Could you go back to that slide where she had that uh s slide up Betsy? Yeah, okay, thank you. Mm-hmm. Mm-hmm. Mm-hmm. Mm, 'kay. And an alarm clock, yeah that should that should be okay. Mm-hmm. Mm-hmm. Mm-hmm. Well you know there's the old motto, children under six never shop alone. So if you've designed something that's very attractive to children um the mummy please mummy please um you know we want it now we wanna go to the store and see it um that has uh a lot of marketing pull. Mm-hmm. That's right. You can make a banana shaped one. Mm-hmm. Respect. Mm. What about the electronics? That's not really gonna change much, is it? That that w that won't change much, will it uh? I d I wouldn't think so. Mm-hmm. Yeah. Yeah. Yeah. That's right, and can we can we is it even feasible to make one one remote control with something for everyone, or would we have to use the same electronics and make three different shapes? Um the same electronics and basically all that's gonna be different is the plastic case. And in that case we could probabl moulded plastic isn't all that expensive is it? Um you as an industrial person? Mm-hmm. Yeah. Mm-hmm. Well there's a real idea yeah. Mm-hmm. Yeah. Right. Mm-hmm. Uh yeah. An alternate package. Yeah. Okay. Well I think we can only aff, yeah. Cosmetic. Warning, finish meeting now. Well we may have to come back to one or two of these points at our next meeting but um Mm-hmm. Okay but we have to I Okay, fair enough. Okay. Yes. Okay. Okay. What features. S sellable. Yes. Yes. Okay. Okay. Receive. Multi-purpose. Eliminated. Mm-hmm colours. Yes exactly. Yes. Like a doll, or Yes. Yes. Okay. Something else. Channels. Yes. Yes. Mm yeah. Yes. Hmm. Okay. To keep the remote? Yeah. A case holder. A holder remote holder. Participant two. Yes. No no, I'm three. I can make it full? Yes yes yes. Okay. As uh User Interface Designer I did a little research to find out what are the features which a user would like to have on their remote. Yeah can you please go onto the next slide? So I found out that uh but uh the main purpose of a remote is to uh f control the function of a television at a far off distance at remote distance. Now for that, uh a remote controller should have a switch on off button by which a user can sit anywhere in the room in front of the T\_V\_ and he can control the functionalities different functionalities of the T\_V\_. There should be a signal uh something like a radio wave or a infrared light or a LED which can be used to change the different functionalities in the television if the user wants to uh change the channels or increase the volume he can change it. Now there should be some timer to set for viewing a particular a particular programme or switching on and off a uh a particular programme according to the user choice. Yes. Yes. So if he want to view a particular programme at say nine o'clock he can set the time, and the T\_V\_ will automatically it will switch on at that particular time. So he can use that kind of uh uh properties of features and then there should be a child lock system if a particular channel is not to be viewed by a particular uh for a certain

age, then the parents can lock that particular channel so that the children cannot view that channel. And uh the uh the uh and the one of the feature a user would like to have is the compactness of the remote. Uh the remote should be compact and it should have as many buttons as possible for controlling different functionalities of the T\_V\_ television. And um uh as uh uh this is my personal preference that it should be in the shape of a T\_ in alphabet for more compactability. And uh and uh and it is one more point which I noted it down, like uh the material which which which is used for remotes should be human friendly it should not cause any skin disease or something some allergy to either children or to um an adult person. And it should have an uh it can have an alarm clock a person if some if somebody wants to get up at around eight eight P\_M\_ then he can set the time and it can be used as an alarm clock, and I don't think it will cost much to set an alarm clock inside a remote. Yes, and as John Reece said the buttons can be, uh can we use the fluorescence to light up the buttons so different uh buttons will glow differently. So in even in the dark the user can know what buttons to use to switch on a particular channel. And uh uh the design of the uh um remote should be in such a way that there should not be any sharp projections so that if a child plays with a remote, he uh he should not be harmed in any way. And findings, uh I found out uh y um on different sites that uh there are different remotes which can be used, there are remotes which use the infrared for controlling the different functionalities, there are remotes which use the radio waves to control the functions and there are uh So uh there you have different uh types of remotes for different light source which are used which can be used for controlling the different functionalities of a television. Next slide. And these are my few personal preferences like it can be used for a multipurpose use. Not, uh no uh like it can be used as a T\_V\_ control as plus an alarm clock to set an alarm a timing and it should have a child lock, and then to save electricity uh there should not be uh much s move uh lots of circuits and all that. And if a person if if parents wants the television to be switched off by ten o'clock then it should be switched off ten o at ten o'clock automatically, so that nobody else comes later and use it. Timer. Yeah and then you can use a timer as well. Yes. Yeah that's it. Okay. T\_V\_ television we was. Mm-hmm. Different colours. Yes. Okay. No uh generally we can we can design a remote which is mainly for people with uh f age from ten to um forty and and then we can add on uh specific functional buttons for children as well as the elderly people or the people with who have nervous problems, yes. But in a family in a family there will be a aged person, children and a middle aged but they cannot buy three different remotes. They would like to buy just one and um just one which can be used all the three uh Cost effective. Okay. Yes. Okay. Um Yes. But uh yeah I I have a doubt like will it be cost wise effective if we if we design a remote having all the uh different features for different people or designing three different um remotes for three different categories of people. Okay. Of th okay. Okay. Mm-hmm. Okay, mm-hmm. Yes. Okay. Yeah? Mm? Open. And then full screen. Mm-hmm. 'Kay. Mm-hmm. Yeah. Yeah. Yeah. Hmm hmm. Mm. Yeah. Mm-hmm. Yeah. Mm. Yeah. Mm mm-hmm. Mm-hmm. Complicated, yeah, of course. Yeah. Mm-hmm. Yeah. Yeah 'kay. Yeah yeah sure. Thank you. Number two, yeah. Yeah exactly. Uh can you make it uh full screen please? No, it's like a well you you have to press here. The cup cup shape here? The thir third. Yeah exactly. Uh so today I'm going to talk about the working design of the remote controller. Um can you go to the next sli slide please? The metal is like uh in a remote controller you have a chip integrated circuit which is like a brain of the remote controller. It takes the power from a battery say a battery it can be a elec an electric supply like you have to uh like uh switch connec connect connect your remote controller to uh power supply from the you know electricity or something like that. It should be a battery because uh uh remote controller should be like you you you should take it t

to wherever you want and then um uh th this integrated circuitry takes energy from the power source and whatever like if you press a button it's like a input for the remote controller and it takes the input and it it transforms into a info infrared bits and it sends it into the device, like a T\_V\_ or a air conditioner, something like that so. Uh a remote controller is specifically designed to a single device. If you want to design it for multiple devices then you should make all the devices compatible with the frequency like uh th the remote controller it sends some bits some uh waves like with a particular frequency the device should know what the frequency is. It should re re recognise the uh waves which are coming from the remote controller and it should take the action like if you press a button channel or something like that then uh the remote uh remote controller will send a send a se send a signal, and the T\_V\_ it should translate that into like change the channel or something like that, change the volume control and uh so uh I think it's hard to design a remote controller for multiple uh devices. Uh yeah. Um. So uh user interface controls the chip and accordingly the messages like there should be a user user in interface like you know switch pad or something like that buttons should be there. So uh you can control whatever you want, you want to change the channel you want to control the volume you you want to uh mute uh mute the uh T\_V\_ or you want to have a child lock or you want to do some operations there's a there should be some device to tell what to do to the uh in uh integrated circuit so that the integrated circuit can s send the signals and T\_V\_ can perform the actions. So can you go to the next slide please? So I I just would like to uh add some extra features to the remote controller um I think these are the very simple features and uh they don't take much uh uh much of the um um investment also, it's like el the text or buttons which uh which are there on the uh remote controller they those we can make uh um like fluorescent uh they'll be like light emitting if it is dark so that you can find your remote controller if it is dark. And ther there should be a beep if many buttons are pressed if suppose a child is playing with the remote controller and a and she she or he is pressing the buttons all at the time then there should be a beep saying that it's this this is not a a you know a a action, there can be no action taking to that so. And there should be a child lock, like uh uh you should be able to lock your remote controller so that uh um whatever buttons are pressed by a child they can't be like y you i you if you have ki kids and all then they'll be pl playing with the remote controllers so can lock the remote controller. If make it useable for more than one device it's a it's hard but I think it's possible but it uh yeah yeah yeah so it's it's okay, yeah, yeah. And uh different shapes that we can do like uh we can have you know a all animals shapes or you know comfortable uh whi which can fit into your hands and um so that uh Yeah, yeah, yeah and colours also, different colours, and No no no, it won't uh I don't think it will be like, you can have you know for uh if you want ther there to be more Yeah yeah. It's it's just a s shape so it doesn't matter. Yeah. Yeah that is also possible I uh yeah I I yeah. Yeah that will be Yeah yeah. Mm-hmm. Yeah, for children, yeah exactly. Yeah, that's what, yeah. Yeah, exactly. Yeah. And and the butto buttons also I think if you want to have more features in your remote controller then there should be more buttons. If there are more buttons then it will be more complicated. If you have less features then your remote controller won't be attractive, so I think uh we need to make some buttons which are which are like um uh f in uh in intended for two or three operations, like if you press one button in one mode then it will change the channel, if you press the other

button in another mode it will change the colour. So if you want to have less buttons we can have that option but I think it will complicate the matter more I think so. Yep, yeah. Mm-hmm. Yeah, it's like you know yeah. Yeah. Yeah, yeah. Mm-hmm. Yeah. Yeah, yes. Yeah, yeah you don't us yeah yeah, usually. Yeah. Yeah shapes also, different shapes. Yeah that will Mm-hmm. Yeah. Yeah. Yeah, yeah, and also text should be very clear so that there there won't be any ambiguities and uh So yeah. And uh

display clock i if you want more features then we can display a clock it I I don't think it will take any money extra money because anyway we have an integrated circuit I think we can just definitely fit that feature into the circuit so it's Yeah, and we display a clock. Yeah. Yeah, and then you can just see your remote controller yeah yeah yeah so Yeah. Yeah. Uh can you go to the next slide please? Uh components uh the main components we need for uh it ha like buttons and uh underneath that there should be switch. And uh bulbs. Like uh we can have a bulb like whenever we are operating a remote controller or uh whenever the T\_V\_ is on suppose, then the remote controller should automatically have a b s light. Then it will be like if you switch on your T\_V\_ through anoth another source, not from through a remote remote controller and you you lost your remote controller maybe you can find with the light. Maybe we can have that. Whenever the T\_V\_ is on, remote controller will have a light. And then uh infrared bulbs. Um this is like uh when it is dark. And battery, there should be a battery for power supply, and a chip, chip which is like a brain to the remote controller which does all the operations, and wires connecting all chips, which is uh lights, everything, so there should be wires. And uh uh of course there should be a case where we can keep all the things and, you know different shapes or whatever it is there should be a case to put to give a shape. Yeah. Yeah, holder. Um uh can you move onto the next slide. Um next sli slide please. Um I have referred the site uh the homepage of the um our website, uh from where I have uh uh I got s few points. That's it, that's it from me now. Um. Uh it's not like that, I have referred the page to get new ideas or like what can be the working design to how it works and all and so and so. Yeah if you want. Yeah, it's okay. Uh, it's actually there now, there on the screen. Mm. Yeah, sure. If there is a clock then there can be a alarm clock. Hmm. It's like a t okay, it's like a timer it's like a lock to the television. Mm, T\_V\_, yeah. Don't T\_V\_, yeah. Hmm. Yeah. Mm. Yeah. Mm-hmm. Mm. Yeah. Yeah. Mm. We can design different remotes for different people, like for aged people there will be big buttons and you know. yeah. Children and everybody, yeah. Yeah of course that we can do, but specifically if y if like elderly people want big buttons then you can't really make a bi big remote controller so maybe specifically you can design a big con remote controller for elderly and for children, like in a different you know. No, it it doesn't cost, yeah. Yeah. Doesn't doesn't doesn't matter. Yeah. Hmm hmm. Uh no. Mm, I I I don't think no. It's not. Hmm. Yeah, like for mobile phones we have uh different you know covers, like designs and all so that w we can have that. Yeah. Yeah, but uh Yeah. Yeah, maybe, yeah, yeah. If we do some more research, maybe we. Hmm yeah, I think maybe seventy percent is a unique uh uh remote controller and thirty percent is yeah it's sort of like yeah. Yeah, yeah, of course, yeah. Mm-hmm. Thank you.

---

# Meeting ID: 37

Data Source: Train

## Executive Summary

The project manager opened the meeting and recapped the decisions made in the previous meeting. The marketing expert discussed his personal preferences for the design of the remote and presented the results of trend-watching reports, which indicated that there is a need for products which are fancy, innovative, easy to use, in dark colors, in recognizable shapes, and in a familiar material like wood. The user interface designer discussed the option to include speech recognition and which functions to include on the remote. The industrial designer discussed which options he preferred for the remote in terms of energy sources, casing, case supplements, buttons, and chips. The team then discussed and made decisions regarding energy sources, speech recognition, LCD screens, chips, case materials and colors, case shape and orientation, and button orientation.

## Complete Meeting Transcript

Okay. Uh good afternoon. This is our third meeting already. I hope you enjoyed your lunch. I did anyway. Um let's see. Presentation three. Okay this is um the second phase uh we're going to discuss today. It's the conceptual design meeting. And a few points of interest in this meeting um are the conceptual specification of components. Uh conceptual specification of design. And also trend-watching. Um these are hopefully the points you addressed in uh your pre uh presentations you're going to show me in a few minutes. Um but first I'll show you the agenda. Uh first the opening. Then we have three presentations. Uh after that we have to come to a decision on remote control concepts. How we're going to make it. And then we're closing. We have about forty minutes. Uh so I suggest let's get started. Uh did someone encounter any problems during the preparation? No? Everything fine? That's nice. Then a little uh thing about the last meeting. Uh these are the points um we agreed on. The requirements and the target market. Uh requirements are uh teletext, docking station, audio signal, small screen, with some extras that uh button information. And we are going to use default materials. Um does somebody have any comments on these requirements? Maybe? No? These are just the the things we thought of, so maybe if you figured something else or thought of something else, just let me know. And maybe we can uh work it out. And we're going to target uh sixty

to to eighty year old customers. So now everybody knows what we're do we're doing, um I suggest let's get started with the presentations. So shall we keep the same uh line-up as uh last time? Okay. Good luck. Okay. Thank you. Any questions about the the trends? Mayb No? Okay, we go on to the next one. Okay. Uh thank you. Okay. Thank you. So that brings us to the discussion about our concepts. Mm. 'Kay. So these are the points we have to discuss. Um first I think we can talk about the energy source, since that's um has a pretty big influence on production price, uh and image. Uh so uh f I think first of all we have to see uh it is possible to introduce kinetic energy in our budget, I think. Yeah. Okay. Yeah. No. Yeah. Okay. Yeah. Yeah. Uh Uh well I think uh elderly people just like to have everything in place. And I don't think they they like uh remotes just laying everywhere in their rooms. So maybe a docking station will help them give the remote a place. And also what you said. Um you can introduce voice recognition by uh finding back your remote. But I think it's um more efficient and cheaper to put it in the docking station. So you have a but button on your docking station which you can push, and then it starts beeping. And then we can we can still use the voice recognition, but maybe then for only the the channels. That's safe. Yeah. That's a good point. Yeah, sure. Go ahead. No. Yeah. Yeah. Yeah. Easier to use? No, I think that's a good point. Yeah. I personally think the L\_C\_D\_ screen we wanna use, with the extra information, I think nobody has anything against it. Because it's just uh some extra information, and it's easy to ignore as well. So if you don't wanna use it you just don't use it. And um yeah I think the um Maybe we have to uh discard the voice recognition. Because it will increase cost uh signifi uh significantly. And I don't think the I don't think it will be a lot easier to use, as well. So that brings us back to the energy. If we don't have the voice recognition, it will it won't use a lot of energy to use. Um So in that case we could use kinetic uh energy, but I think just a simple battery which you can reload on a docking station is just as good. And much cheaper as well. So Okay let me just choose for the battery. That brings us to the chip. Just the advanced. Okay, advanced chip. And then we get to the point of the case. Um which brings us a little bit back to marketing as well. Uh if we wanna choose for wood or the black and grey. Or both? Um as we saw there is n

ot Yeah wood is a lot more expensive to produce. Um but I think it will attract elderly people who wanna have something exclusive, which they can show off to their grandkids. Look I've got a new remote control, and uh Yeah. That's right. But with colour was a lot more expensive? Or? You don't know? I think so because Yeah. It's a lot more difficult to to handle and to to get in the right shape. Yeah. Change the cases. Yeah. You can sell the cases. Yeah. I think that's a very good option. Because um then you can advertise as well with the Give your grandfather a new case for his remote control, or whatever. Because that's a it's something extra, it's something other remotes don't have, which we can get a great advantage point. So and then you can make them with colour. Black and grey, other colours as well. Costs. Yeah. Yeah. So you suggest we should design two different telephones on which you can apply, yeah remote controls, on which you can apply different case covers, for example. Remote. Yeah. Okay. So everybody's okay with the changing covers? I think that's a good uh good option. Changing case covers. Yeah. Mm. Okay. Uh but the form has to be um It has to It's has to be possible to stand up? Or just only to lie down? And the the cover of the the docking station is also on top of the television then? Or not? And you can just yeah then click it in. That's okay. Um so the interface. What type of interface do we want to use? Um maybe you can make a little drawing of it on the on the the board. Does somebody have ideas for a form or Yep. Mm. Usabili Yeah ease of use will be a lot more difficult, and then it's But you have extra buttons. So people can get confused. Especially if they have the same writings on it. Can't we make uh Can't we make a remote which you can flip over and use on the same functions as the normal one? Then you have to Let's see if I ca A blank one. And then you get

Here's a little L\_C\_D\_ screen. Uh now I have to think. It's a plus and a min. No it's not very handy I think. Because the plus and the min will be opposite and all kinds of No that's not gonna work. I guess. Maybe we should Yeah. But is it a problem that left-handed persons use a different hand? I think the functions are that basic that nobody should have any problems with uh choosing a channel or Y yeah. Yeah. I think we could just uh leave it a normal shape. Uh but maybe we have to make it a l a bit more fancy. In one or another way. Yeah. Um yeah just Yeah. Easier? 'Kay. I suggest um the single curved, because maybe the curve is pretty good to put the the screen in. Uh so that elderly people can uh use the remote control and at the same time look easily at the screen, because it's a bit, it has a bit of a angle. Yeah. I think so. Yeah. But now it's Do you have it upside down or Do you have it this that's top? Okay. Yeah. So get your mouse. Yeah. Yeah. That's a good one. But I think it's better to put the screen uh on top. So just flip it a hundred and eighty degrees around then you get here. If you can have this one, you turn it like this. And then flip it upside down. Because uh maybe your hand is in the way, if you have the display here. I think i On top. Yeah.. So then we get Here's That's the curve. Here the display, and then buttons. Yeah and then we can have a little bit off here and here maybe. Just that's for left hand and right hand users. And then h the rest of the buttons over here. Yeah still here jus That's Yeah. Should be more bit more friendly, yeah. 'Kay. Supplements. That's okay. Where's my mouse? Then We've got a general idea of the concepts and the materials we're going to use. So now for the next meeting uh we'll have to look at the look-and-feel design. It's important that the corporate design image uh is going to be in the remote. So check out the corporate website maybe. The user interface design, it's the same story. And product evaluation. So the Industrial Designer and User Interface Designer are going to work

together on this one. But you're going to get your instructions I think sended by the coach. So just um I will put these um minutes on the in the folder. And then we're going to uh try to finish our project, and uh make a good design for all the grandfathers and grandmothers, I think. Which are Uh let's see. I'm not sure if you're going to start right away to work together or I think you're going to fill in the questionnaires first. And then you'll get a message. So that's uh basically it. Maybe this one? Then we can save this one in the folders group. Uh yes, it's here. SMARTboard, there it it. So if you wanna have a look at it, it's over there in the projects folder. And then I guess we'll start in thirty minutes again. Thank you. Good afternoon. Sure. I'll start off then. Doh. 'Kay I'm uh gonna inform you about the trend-watching I've done over the past few days. Um we've done some market research. We distributed some more enquetes, questionnaires. And um besides that um I deployed some trend-watchers to Milan and Paris to well get all of the newest trends. And I've consulted some additional trend-watch trend-watchers, after the original trend-watchers return, about what the the best design would be. Um okay these are some overall findings. Um most important thing is the fancy design. Um the research indicated that that was by far the most important factor. Um innovativeness was about half as important as the fancy design. By innovativeness this means um functions which are not featured in other remote controls. Um about half of, half as important as the innovativeness was the was easy to use. Um for our um group, we're focusing on the people of sixty to eighty y years old, this is um, these factors are slightly more equal. 'Kay these are some more group specific findings. Uh the older people prefer dark colours. Uh they like recognisable shapes, and familiar material. And our surveys have indicated that especially wood is pretty much the material for older people. Um this is, this image will give you a little bit of an impression about um the look-and-feel that um the remote should have. Um this leads us to some personal preferences. Uh the remote control and the docking station should uh blend in in the in the room. Um so this would mean no uh eye-catching designs. Just keep it simple and Well the docking

station and small screen would be our main points of interest, because this would be the These would uh be the innovativeness in the remote control. So this would be very important that we at least include these features. Um well the trend-watchers I consulted advised that it b should be, the remote control and the docking station should be telephone-shaped. So you could imagine that uh the remote control will be standing up straight in the docking station. This is not really This is pretty much a new shape to uh older people. So they would prefer uh a design where the remote control just lies flat in the docking station. So it would be kinda more telephone-shaped. Um besides that we would advise um to bring two editions, one with a wood-like colour and maybe feel, and one with a grey-black colour. The wood-like for the more uh exclusive people. People with more money. Uh the grey-black colour for well people with less means. That would be all. Any questions? And how exactly does the kinetic energy work? You just You use it and it works. Okay. Well personally I don't think that older people like to shake their remote control before they use it. And besides that you mentioned it would make the docking station obsolete. And I think our docking station could be one of the marketing issues with which we can um get great popularity for our product. Um wel Yeah you could load up the batteries, you could um insert the find the lost remote control function in there. That's true. I'm wondering um what will the voice recognition mean for the production price? 'Cause in our earlier um market research, if you'd allow me to go to the

flat board, SMARTboard. Um so it was open here. Um we also um asked if w they would, if people would pay more for speech recognition in a remote control. Well you can see here, our target group would not do that. So if that would increase the price for which we're selling our remote control I would greatly advise not to do it. I think that would be better to uh insert in our other product, that is meant for the younger people. Um well this is Yeah but this is here the question was, would you prefer it. So that doesn't really mean they wouldn't pay extra for it. And on top of that the L\_C\_D\_ screen would um help in making the remote control easier to use. And I think a voice recognition function would not make the remote control much easier to use. Um well this was for like an L\_C\_D\_ screen like you would have on a on the the most advanced mobile phones. So pretty large. 'Kay. Mm-hmm. Mm-hmm. Well And I think most important factor there is the wooden colour. So it wouldn't actually have to be wood, if it's just wood-coloured. Probably. Yeah that is true. Yeah. We would have to look carefully into the design though. 'Cause we would have to make one w uh control which would fit in with a wooden cover and a plastic cover. The more original one, or the more standard one. So that would Well I wouldn't design a telephone but Well no I think w we should just, we should then just design one um one remote, but it would have to be fancy with either the wood cover or the plastic one. So, but that shouldn't be too much of a problem. Um I heard our Industrial Designer talk about uh flat, single and double curved. Could you explain that a little more? Mm-hmm. And what would single curved and double curved mean? Okay. So we can pretty much just do whatever we want. 'Kay. That's good. No just to lie down. We'll go for that. Well or besides it. Mm-hmm. Um you uh said you wanted to put the um changing channels button on the right side, so you could, so your thumb would be easily Well uh I think that was a very good point 'cause I pointed out earlier that a lot of remotes cause R\_S\_I\_. So that would be great for that. Um I thought maybe we could just make one of those buttons on both the left and the right side. For left-handed users also. For the volume. Um well that could Yeah we could do that but I'm not sure if that would be very good for the easy, ease of use. But if we would make um a changing channels and changing volume button on both sides, that would certainly yield great options for the design of the remote. 'Cause it could be made all symmetrical and stuff. That is true. Yeah. Yeah. That is true. Yeah. Mm-hmm. Mm. Mm-hmm. Mm-hmm. Yeah. Yeah. Mm-hmm. And I'd prefer the corners to be round.

Think that would be better. Friendly on the eye. Yeah. Yeah. Very good. No. Mm no. Um 'kay um yeah. uh some uh research uh a about um designing of an interface. Um the uh last meeting uh we had a about um uh using a f few buttons. So uh um uh that's w what I what I want to uh uh to do in uh our design. So um finding an attractive uh way to control uh the remote control. Um the uh I found some uh something about uh speech uh recognition. So maybe uh we can uh use uh that. Um Uh and uh using a little uh display. So um findings. Um yeah just um we have just to focus on the primary um functions. So uh only uh buttons uh for uh sound, um for uh on-off, um uh shifting u up uh sa uh ca channel or uh down shifting down. Um uh let's see. Um yeah and Uh we uh need some uh new a attractive functions uh uh which attract uh uh people for using it. So uh it's uh like a speak uh speech uh recognition and um a special button for selecting uh subtitles. Just uh what we uh mentioned uh last uh meeting. Um and yeah overall um user-friendly. So uh using uh large large buttons. Um It's uh possible to uh uh to make um quite cheap uh system for uh speech uh recognition. Um you can think about um uh when you lost your um remote control, you can uh call it and um it gives a

n um sig signal. So uh uh yeah. And and uh for uh shifting up a sen uh c ch channel or uh for um uh putting out uh sound or something, you can uh just give a sign uh say um sound off or A and uh yeah. Television uh put the sound off uh put the sound off uh. Um Let's see. Uh yeah. I was thinking about the special uh button for uh subtitles, um just one button to keep it uh simple. Uh one push on the button uh you get uh uh small uh subtitles. Um double push push um, if double click, um so uh you get uh big uh subtitles, for uh people uh um uh which c f uh who can't uh read small uh subtitles. So uh Um Yeah and w we have to keep uh in general buttons uh so um we've got um the buttons we have to use. The on-off, sound on-off, sound higher or lower, um the numbers, uh zero to uh uh nine. Um the general buttons m more general b one button for shifting up and shifting down uh channel. Um also we want to uh use a little d display uh for um for displaying the uh the functions of the buttons. And um we can uh build in a function f which uh shows the channel or some uh which the t television is on. So um made a little uh picture of uh it. Um See. Um yeah. Just um we can put uh the on-off button uh over in this uh corner, um almost uh e all uh remote controls uh are using a on-off button on that place. Um so uh people uh will uh recognise uh um the button. So um D display uh of it, it's uh just a small display. Uh um you can put it uh on top. Um it's uh most uh uh place where people uh, most of looks at. So uh um and a special uh button for shifting up uh and uh shifting down uh channel, um it's uh on place where um the thumb of of the So you you can uh easily uh shift up or shift down. Um it's uh quite uh handy place. So um and uh all the f functions for subtitle uh one button, uh for sound uh Uh and uh for our design, um uh we have to discuss about it uh I think uh so uh the form of it so And that's it. Mm. Nah. But what's the function? Yeah f for loading up uh the batteries. B b Okay but uh it won't use uh much e energy uh I I believe. Uh it's uh just a small display so I believe uh it will run on one battery for um six months or f or or more. So I believe one battery uh is just enough. Uh so Okay. Yeah. That's true. Yeah. Mm-hmm. Yeah. Okay. Yeah. Uh. Mm. Mm. 'Kay. Yeah. But uh is uh our uh research um about um bi large uh L\_C\_D\_ sh uh display, or uh just a small one uh we want to uh use? Okay. Yeah. No. Yeah. Yeah. Mm-hmm. Yeah. Uh I dunno. Mm. Mm. Uh is it possible uh to make um changeable uh case. So um uh you 'cause uh Yeah with uh mobile phones uh uh so uh like the Nokia mobile phones, uh when you can change the case of it. So maybe it's possible uh possibility. So um um you have just to make one um standard um remote control, and um yeah you can sell uh few uh Yeah. Yeah. Yeah. Yeah. Yeah. okay. Mm. Uh we can just use the regular form of it, but it's um not quite uh fancy. So um Yeah. Yeah. Yeah. For uh Uh for Yeah yeah. Mm. Yeah we um Is it possible to um program it s so uh you got on the left side uh or on the right side uh buttons for for shifting u up and shifting up? And on the uh

other uh uh o other side uh buttons for uh shifting, uh for for the sound? Or Or isn't it? Yeah okay. Uh. Mm. Yeah but Yeah. Yeah. Yeah. See um yeah. Or we have to make a left uh For lefties and Um You mean um Yeah if Mm no. Yeah. Um Yeah. It's just uh u using uh your thumb. So um it's Yeah. Yeah. Um Yeah yeah. Mm-hmm. Mm. So um Do you say this um S uh Uh you got like uh sort of a I believe There? So um you want to put a display over here? Or not? Yeah. Um Yeah. Uh we can make it um Mm? That's the top. So uh this top. This down. Um maybe it's possible to uh make this side like um Let's see. Um Colour uh okay. Uh to make this side um like mm the right colour. Um bit like so uh um in the form of your hand. So um Uh it's an So so the remote control have to um lay in your hand. So uh it's possib um yeah for s so and And to put uh the the buttons for

um changing uh the channel uh over here uh Yeah. Uh rem Yeah but this place um Uh it's Yeah I dunno um Yeah. Yeah so So Five minutes. Yeah. Yeah. But um the on-off button, um still on the top uh Yeah. Yeah. Yeah. 'Kay. Yeah. Yeah. Yeah. Okay. Okay. About the components design. Um for the energy source we can use a basic battery or, a as an optional thing, a kinetic energy, like in a watch, which you just shake and it produces energy. But if we choose for that option, the docking station would c become obsolete. So I don't think it's really an option. Uh for the casing, uh the uh manufacturing department can deliver uh a flat casing, single or double curved casing. It's really up the the design that we're gonna use. It's uh doesn't uh imply any technical restrictions. Uh as a case supplement, we could um, I thought of that I later, uh a rubber uh belt, like a anti-slip. Uh for the b buttons, we can use plastic or rubber. And the chip-set, um it says simple here, but it should be advanced, because we're using an L\_C\_D\_ uh screen. And as uh the trend-watcher presentation showed, um people like wood, but it raises the price and it doesn't really fit the image, unless we would start two product lines. Form should follow function overall. Um well the kinetic energy source is rather fancy. But depends on what we want. I think we should disc discuss that. Um for the case, uh the supplement and the buttons, it really depends on the designer. And the chip-set uh really should be advanced because otherwise uh it would really be a simple uh remote control. And that's it. Yes w there there are four options. We could use the basic normal battery. Uh a hand dynamo. But I don't think that's really an option. You don't wanna swing before you can watch television. Uh solar cells. But not every room is very light so it's not a very good option. Or the kinetic energy. Well y you basically shake your remote, and then it powers up. Yeah. Yeah. That's true. Oh. Mm I don't have any information on pricing. So I'll have to ask the manufacturing department. But that would also go for the L\_C\_D\_ screen then I guess. It's a bit higher percentage, but Okay. And that's the best choice. Well there isn't any choice there because we're using the the the the display. So it's gotta be advanced. Mm I dunno. I'll have to uh research. Yes. Yes. Well the the general like most older remotes are flat, just straight. And uh our d manufacturing department can also deliver single curved or double curved ca curved cases. Um it would just only affect the form, for as far as I know. So it's j really just up to the design department what we're gonna use. It doesn't really matter for the price or the functionality. Pick one you like, yes. Yeah. I think we should start by by choosing a case. Because that's the basis you're building on. So I could draw them out. Let's look at the flat case. Oh. It's from the side so it's rather normal. The the single curved so I'm not really sure what they're gonna look like, but I think it's something like this. So this type should be better for you or better Should prevent repetitive strain injury a bit. And the double curved s looks something like this I guess. So th those are the three options we have. Yeah. It's more logical to have it on top as well because, like on your mobile phone, it's always above. Oh maybe you should just s start on a blank page. Okay. Okay.

---

# Meeting ID: 141

Data Source: Train

## Executive Summary

The project manager opened the meeting and stated the agenda. The marketing expert discussed user preferences in terms of the appearance and use of remotes, finding that users wanted fancier looking remotes, disliked losing their remotes, wanted remotes with fewer buttons, frequently use the channel changing and volume buttons, and that younger users wanted speech recognition. The user interface designer described how a remote works and how to go about designing one. He presented two remotes currently on the market and the advantages and disadvantages to each design. The industrial designer described the interior workings of a remote. The project manager briefed the team on some new requirements and led them in a discussion about their target group, the option to include speech recognition, how to find a remote when lost, and batteries.

## Complete Meeting Transcript

Yep. Well there's a wee a wee plug just just that one there Ah that's it, yep. And then you have to press function F\_ eight I think it is on your laptop. That's it. Repetitive strain injury. Repetitive strain injury. So if you Cheers. Here we go. Right so I'm gonna talk about the technical technical functions design of the remote control um. We need to start by considering what a remote control actually is. It's a device that allows us to produce certain effects on our television, so i it's basically a communication device. We we tell the remote control what we want to do, it sends a message to the television saying change the channel, change the volume, uh yeah, adjust these settings, adjust the brightness. Um how do we actually go about designing a new television remote control? First thing to do is to come up with the design specifications. We need to know what our final product is gonna be like, so we need a a clear idea of exactly what this product does, uh how it works, and what the end-user is gonna want from this product. Um. Oh, a way I'd suggest that we could go about this is by designing uh several different prototypes of user interfaces for this product, um and then uh trying to get some feedback uh about h how well these particular prototypes work, uh sorta find out what people think of 'em. Um using a remote control is quite a subjective experience. Um, and different different people sort of prefer different things. Um we should remember that remote controls are a fairly standard piece of

equipment. When a user is using a remote control, he or she expects the buttons to be in certain places. So in some sense we're gonna have to aim for a device which is fairly conventional in design uh so that we're not completely shocking people. But I think within that there is also room for us to introduce novel ideas uh and to make something that's perhaps a little bit different, something that stands out. Um also in designing the user interface we need to consider practicalities. Uh the first of these is technological ye uh what can we do with the current state of technology as it is. The second is economic, uh we need to find a balance between features and price. So as you mentioned things like voice recognition would add to the price uh but it would also improve the design of the product. So I had a look on the web uh to see if I could find a few examples of existing television remote controls. In analysing these we can consider what things what's good about them, uh what things do they get right, what's bad about them, what's wrong with 'em, um how we can improve on the designs that that I found and what can we do to make our product stand out from the large majority of remote controls. Here's two examples uh probably at the extreme ends of the spectrum. Um on the left here we've got uh an engineering-based design for a remote control, so it's one that's got lots of buttons, it's fully featured, everything you might possibly want to do is there, you know, it's got forward, backwards, up, down, channel numbers, volume, uh freeze frame. Yeah, it's fully featured and it might take a while to get to learn to use it, but once you've learned it you can do whatever you want with your T\_V\_. The one on the right is a lot more basic. It's just got the essential functions of the T\_V\_ changing the channel, play, stop, volume. It would be a lot quicker to learn to use it, but again it's swings and roundabouts. There are disadvantages, you can't use it to freeze the television picture. Uh there's a lot of features that are missing from that remote control. So we've got to find a way of striking a balance between the two. Um as I said before, remote controls are subjective, different people want different things. Um personally what I want from a remote control is a device that's simple, it's easy to use, uh it's got big

buttons for doing the things I do most often, changing the volume, changing the channel. It does everything that I need it to uh, as I said before, I'm quite lazy, I don't wanna walk across the room just to adjust my television. I also want something that looks cool, um and that feels good, that's ergonomically designed. I think there's certainly a market for technology that looks cool. And I think that's why companies like Apple've made a lot of progress. Uh that was just on the company web site, yeah. What's up? Lefty loosey. Uh. Never heard that before, that's good. I'll think of that every time now. You don't have it in the States? Oh, I didn't realise. Um yeah, it's like a I suppose it's kind of similar to a very very basic web browser. Um you have like you have uh numbers on your remote control, uh y and you type in the page number you want, so like you type a hundred on your remote control and this kind of index appears on the television screen with just some text and some very blocky looking graphics on it. And you just type numbers to go to different pages and it gives you information, mostly rather boring stuff like what's on T\_V\_ next and share prices and that kind of thing. Yep, news headlines. It's early it's pretty old technology. It's like nineteen eighties. Right. So what's our corporate image like? It's kind of yellow colour with uh we put fashion in electronics. It's like double R\_. Yeah. Is it something that's gonna be sold separately from the television or is it something that comes with a television? 'Cause that would affect the way that we market it. Right. Right, okay. Yeah. Um. I would say no, because it's gonna add too much to the price. Especially if we are marketing it as a separate product, people are gonna be paying uh, well, uh we've got a price limit of was it twelve and a half Euros for to produce it? And I wonder if we can get voice recognition into that twelve and a half Euros without having to make too many other

compromises. Yeah. Yeah. Yeah. The remote There are remote controls like that, yeah. Like some T\_V\_s they have a sort of uh a sliding screen on the remote control of it that hides all the complicated buttons. So if you wanna do something complicated like programme your television or re-tune it, then you you open up this little hatch or or slide the screen down and there's all the all the special buttons. Yeah. Yeah. I think that's a good idea, yeah. Yeah. Si simplicity and fashion. Yeah. Yeah. Yeah. It's, yeah, it's pretty it's pretty high-tech. It's for, like, the ultimately lazy people, who can't even be bothered to pick up the remote. Yep. I think the product appeals across a quite a broad range of ages. I mean, we we said simplicity is is one of the features, so it's going to appeal to people, maybe people who have problems with technology, you know, people who get scared by having lots of buttons, and that might be older people, but then we've also got fashion, which is something that definitely appeals to younger people. Yeah. Yeah aim for a an income group. Yeah. Yeah. Yep. Yeah. Yeah. Which are kind of hidden away in some way or well not hidden but they're uh they're not as prominent as the main features. We should maybe investigate whether it needs a battery at all. I suspect the remote control does need a battery, but I dunno if you can Yeah. Yeah, without the energy, yeah. Yeah, that's that's possible. Yeah. Yeah. Yep. Mm shall we go in the order that you just did it? I dunno. How do I hook my screen up? Where does it go? Mm-hmm. Hmm, I'm not supposed to move this, but Where's function? No signal. Ah, wait, 's screw in. Push the screw. Mm alright I've never attached to anything. Alright, so, I don't know if you guys are able to get access to um the report that was online or if I'm the only one who is. But, I don't even know how to play this. No. Alright. So we're just gonna talk a little bit about

the functional requirements that people specified when they were asked. Um I guess Real Reaction did some market research. They had a hundred subjects and their usability lab and they watched them watch T\_V\_ and recorded the frequency that they used particular buttons and the relevance that those buttons had. What they found was they analysed people's desires and needs. Focusing on their desires, um people specifically said that they thought remotes were ugly, seventy five per cent of the a hundred subjects noted that and that they more importantly though, eighty per cent said that they would be willing to pay more for a fancier looking remote. I don't know anything beyond what fancy means, but that's particularly of use to us, I think. Um also they did some questions on voice recognition and found that the desire for voice recognition was inversely related to age, so younger people were more inclined to want something with voice recognition, whereas the older people in the like sixty and above segment or so did not really think that they would pay more money for voice recognitions. Um people also had certain frustrations, that I think that we could try to take into consideration with our design. That being people k um frustrated with losing their remotes. I think, over fifty percent of the people mentioned that that was their biggest frustration. People are also frustrated with the difficulty it is to learn how to use a remote and I think that ties back to what you were saying before just that there's too many buttons, it just needs to be easy to use. It also mentioned something called R\_S\_I\_ and I was hoping someone might be able to inform me as to what R\_S\_I\_ is, because I don't know. What? Ah. There we go. Wow. People do not like that. So I guess sort of the carpal tunnel type thing, people do not like that, um the repetitive use, I guess, caused a strain. Um looking at the needs people specified, the problem right now is that people's remotes are not matching their operating behaviour. People are only using ten per cent of the buttons that they have offered to them on their remote. And what people do most often is changing the channel and changing the volume. People also zap like to change the channel, about um sixty five per cent during an hour of use. So we really just need to focus in on those volumes and channel changers rather than things like the audio settings, the screen settings and the channel settings, because they're used much more infrequently and probably just complicate what's going on.

So I think that some things that we might wanna think about, the idea of an L\_C\_D\_ screen was brought up although they didn't have any details on what people's preferences on that were, so I dunno know if that's coming to me later, or something like that. But something for us to consider also just the phenomenon that less is more when it comes to the buttons on the remote or what we wanna make easiest to use, make sure that, you know, something like an audio setting isn't given as much importance and visibility on the remote as something like channel changing that's used a lot more often. And basically in order for us to win over to the consumer we just need to focus on what it looks like, that it has a fancy appeal and that it's not ugly and that it feels like the way they're gonna use it, so it doesn't give them any hand injuries or things like that. Hmm. Yeah, have I unscrewed it? Here we go. Mm-hmm. And I think that's in the shared, if I did it right, if anyone wants to look at it. No. A fashion fashion remote. Mm-hmm. Yeah. So wait, did it let you go on the Internet or was that just what it let you see? Okay. 'Cause I was like googling and then I'm like wait it won't let me google. Yeah, that's a good one it'll stick with you. What's teletext? Oh. Oh, so Mm-hmm. Oh. That explains a lot. That's good. Mm-hmm. Mm-hmm. Yes, I do think, who's gonna have the money to buy that also, that one? The only break-down that I was giv

en in terms of age was the voice activation and basically there's a big jump, after thirty five people don't really care if it has voice, so it's like basically fifteen to thirty five that think that that's a good idea. I dunno I'm gonna be given any other numbers broken down in terms of age later, but if that's sort of the only quality that we have that is divided into age then we would wanna stick between the fifteen and thirty five range. But what else are we gonna put, I mean not that I'm really gung-ho about it, I don't know what else you can put in a remote to make it technologically advanced though. So like other than just making it look good, how is it I mean it can look really great and still have the same up-n-down buttons and why's anyone gonna buy a new remote? Mm-hmm. If someone's looking to buy a new remote, don't they want like an upgrade? I dunno. Mm-hmm. Mm-hmm. Can you like I mean this may be too complicated, but, I wish I had something to explain it, like if it was just a simple, either this way or this way, that had like the main buttons and then you could like pull something out, kind of and like you got the rest the buttons, but the rest of them like went in. Do you know what I'm saying? Mm-hmm. 'Cause then 's like people who don't wanna ever look at them, never even have to see them and if you like get the instruction manual that comes with it and you just don't even read it then you'll never even know that those things can pull out. And you're a happy person and everyone else doesn't have to have like two remotes, one that has the easy ones and one that has more complicated ones, but 's all still in one. Yeah. I think simplicity, fashion. Mm-hmm. What can you do to like make the infra-red more functional, like why would it not be? I'm just wondering. Okay. So 's just the quality of the chip. Okay. Well, I dunno how useful that number is if we're not doing Yeah. Yeah. I don't. And if the whole idea is you're using a remote then why would you have voice, like you know what I mean and then it's like you wouldn't need a remote you'd just talk to your T\_V\_. Mm yeah. Maybe I mean if I get m more numbers, I'll e-mail you before the next meeting in terms of ages. But this doesn't divide up anything and there was only a hundred subjects also, which isn't, I mean, really isn't that representative, especially if it's a hundred subjects that th they then can subdivide into age groups that means there's very few in each age group, so Twenty to like fifty five. I dunno. Well maybe we don't have to defi define the target group by the demographic of age, maybe we can define it by like the demographic of like h t how much money they have to spend or something like that, like, well obviously it has to be someone who owns a television, and like how recently have they bought their television like that sort of thing. Yeah. H I mean, like I said before, fifty per cent of of the fru f like frustration someone can have that was the biggest one

and half the people said that happened and we all mentioned it before we knew about it. And if we're talking about making something easy that sort of goes along with it so it wouldn't be like a random thing to sort of add in. It would be relevant to like the overall goal I think, so Hmm. on your coffee table, it's not like an eye sore, that kind of thing. Yeah. So you never have to change the battery. Mm. It's good. Did you um were you able to like put yours in the group folder? Okay. Yep. Where is that? Yours is I only have three, I just have like our three. Yeah. No, but that's 'cause I think yours is in the e-mail separate, like it's not on the server. But if I open it and then save it, probably will be there. Oh wait, never mind you can't save it to the Okay. Right. I think, you might have to disconnect Rose. Yeah. I I think you just have to push it in really hard. Oh, got it. Mm, neither have I. Alright. Hmm. 'Kay. Hmm. Hmm. Mm 'kay. Okay, great. Hmm. Yeah. I think that could be our

selling point. Right. Hmm. Right, I really can't see what I'm doing, so does anyone have a Ah-ha, look at that, showing up already. Yeah. Alright um No, how do I play again? Ah. Okay. So this is our working design presentation. Um I had a bit of some issues with this, because I wasn't able to find everything I needed, but I guess that's we're still in early stages. Um so, yeah, this is this. Though th the thing about working design is the what we're trying to do as a working design is figure out how the aparata apparatus can fulfil its function. Um one of the examples that kept coming up for me is that a coffee grinder. It works because it converts electrical energy to grinding the beans and then you put the bean through a filter and that filters out, and then you get coffee at the end that's nice and hot because of the combination of electrical energy and then the other things that are brought in to make it work. Don't know if I'm explaining that very well, but how do I get to the next s ah. So h the method as um working designers figure out what you need to make it fulfil this practical function, what what needs to be done and how do we convert all the elements to make that done. So wha the easiest thing to do is to break down all the points at which you need something to happen. So you make a schematic of the way that the the energy is converted tsh towards this practical function. And then I think the easiest thing to do is gonna be work on each task separately. So um Uh. Uh. So the findings that I got uh very just very briefly is that you have a choice of the way that the information is projected to the receiver and in my opinion infra-red is the best way to do that 'cause you don't need a sight line. So that's one thing we're gonna work on. Um the user interface is critical here, because a lot of the things that happen in a remote control happen through the chip that controls that converts the electrical energy into data, which then goes through the infra-red, so the the chip that uh I think Ian is designing, is gonna be crucial. And really it all comes down to the to the user, because they're the one that's controlling most of the working design. So the components that we find here are the energy source, you know the battery or whatever that's gonna m make it work, then the chip, which converts the data, the user that's controlling the chip, and the infra-red bulb that's gonna let us move the data to the receiver. So you have four main components and they are designed sort of like this. You have your energy source right there which then um brings uh energy or information to the chip, which is also controlled by the users. You have energy going to the user who's controlling the chip ooh 's not what I wanted to do uh uh. Previous. Sorry about that, guys. Oh. No, no, no, no, no. Okay, let's just get back to my schematic here. W yeah, yeah. I think it's frozen. Here. Don't show me that tip again. There we are. Sorry about this, guys. I'm kind of pathetic with things like this. Um alright. So you have your energy source, your user interface who's controlling the chip, the chip also uses the energy, and the chip through the use of the user interface is gonna control the switch which will work your infra-red bulb, which will then bring the data to the receiver. So hopefully that makes sense for everyone in my kind of garbled way. This is the the parts of the working design that need to be figured out. And personal preferences, besides the fact that I can't spell, we

need a long-lasting energy source, people don't wanna be changing it a lot. We need a chip that works well with the user interface, that isn't too complicated. We need a straightforward interface, like Ian was saying, simple, not overwhelming it with information and we need a reliable and clear infra-red signal, so that you're not waving your remote around and having to get frustrated and go do it by hands. So that's pretty much it for the working design. Rose, do

you think you can give me a hand with this? Yeah. Yeah. It's gonna stick in your head. Mm. Ooh, no signal. Okay. Uh, it's a British thing. No. S Lottery numbers and sport scores. But if you ever see the T\_V\_ saying like go to page one sixty on Ceefax now, that's what they're talking about. I have no idea why we don't have it, but 'Kay. Mm. Okay, so we want something that looks good and is yellow. Okay. Well if we're gonna say that function um fashion we put the fashion in in electronics then you automatically, I think, a sort of younger group that that's who's gonna be attracted to this. Mm-hmm. Mm-hmm. Yeah, that's probably uh a population w quite a little bit of disposable income for use on technology anyway, so that might be a fairly good target group for us. Mm. To produce it, yeah. Hmm. But right. Well but why are we why are we aiming for a technological advancement? Everything we're talking about is ease of use and simple and that doesn't necessarily mean more technology, in fact it could use it could mean, not. If they might be overwhelmed with with remotes that have too many buttons and too much technology. Yeah, simplification. They could have a crap remote that came with their T\_V\_ that's just impossible to use, or maybe it broke, or maybe they're just missing it. Hmm. Ooh. Ooh. Mm-hmm. Yeah, that's a good idea. Mm. Good point. Yeah. Yeah mm. The battery and that I think that the chip takes the data and presents it well, without sort of scattering. Yeah. I think so. The quality uh quality of all the components really, I mean, we can't really do anything shoddy work, 'cause it's gonna be visible down the line. Mm-mm. Yeah. Ooh. Yeah. I Mm-hmm. Yeah, but I th I think regardless we're we're aiming for the under sixty five or something. Or like single professionals or something. Yeah. It's really hard to figure out right now. Yeah. That's a good point. Yeah. Mm. Yeah, t probably. Mm. Mm. Yeah, that'll probably be good. Yeah. Yeah. Mm-hmm. Yeah. Alright. Battery battery use. Yeah, but I think that goes in with simplicity and ease of use really. Yeah. Yeah. Mm. It I think it does. I don't I don't think of a way you can operate a chip and convert that much data without without one. But you could maybe have it in a little charging station like a mobile phone, or like a little cradle for your iPod. You could we could maybe do that instead. So you don't ha you got like a rechargeable battery. I dunno, that might contribute to less people losing it too if it stays in one place. Mm. Yeah. That's just off the top of my head. Yeah, who knows. Okay Sounds good. Yes, I just did that. Hopefully it is there for people. Yeah? Yeah. Okay. Technical. So in there we have technical functions presentation, working design presentation and the functional requirements. At least that's what I have in. Yeah, that's what I have as well, R Rose So. Yeah. Okay. Good to see you all again. Let's see if that comes up. This is our functional design meeting. Um. Just a sec while my PowerPoint comes up. Et voila. Okay. Mm um we put the fashion in electronics. Let's start. Okay, our agenda today um just check the time, it's twelve thirteen. Um. I'm gonna do an opening, talk about um did you all get the minutes? I e-mailed them to you. I'm also putting 'em them in the shared folder. So um then I we'll talk about our general objectives and have your three presentations. Um I'll talk about the new project requirements I've just received, and then we have to make a decision on our remote control functions. Finally we'll just close. We're starting this meeting at approximately twelve thirteen and we have forty minutes. So First of all the functional design objectives. Uh we need to keep in mind the user requirement specification, what needs and desires are to be fulfilled, the functions design, what effects the apparatus should have, and the working design, how the apparatus actually works to fulfil its function. Okay, three presentations,

um you can go in

any order you choose um. Sure, please do. Yes I do. Yeah. Function, F\_ eight, yeah. The blue one, F\_N\_. Is it plugged in all the way and you screwed it in and Mm 'kay. It's taking it a little bit 'Kay there you go. Press the little presentation. It's the um it looks like a Y\_ kind of over there above Draw. There, that one, there you go. Thank you very much. That was that was great. Um 's move on to the next presentation um on effects. Was that you? Great. Push. User interface, right. Interface. Mm 'kay, thank you. Okay. Hmm. Hmm. Mm 'kay. Thank you very much. That was very useful. It's funny to see the drastic difference between those two remotes. Um. And neither of them were very pretty, you know? Mm. Mm. You there it is. Lovely. Hmm. Um the it's right above Draw. There are three thingy if it's way at the bottom. Under three icons and it's the one that looks like a desk. Yeah, that one. There are Y\_s. You just press yeah, just click. That'll be fine. Um yeah use that thing you can go back, previous. Pardon. Oh, well. Okay. Ye Double click on it. With the right with the left hand one. There we are. Mm-hmm. Mm-hmm. Excellent. So, um. Yes, absolutely. Ah I can never tell which way to turn these things. Lefty loosey, righty tighty, right? Lefty loosey, righty tighty. Oh yes. Mm 'kay. Um I have nothing on my screen. Just a sec. Here we are. Okay, yeah, it's fine. Okay, requirements. We have a couple new requirements that I was just e-mailed right before the meeting and that we have to keep in in um in mind as we're creating this. We didn't bring it up yet, or at all in the meetings so far, but we're not gonna work with teletext because um well it that's been taken over by the internet, so we're not gonna worry about um we're not gonna worry about that. Um. It no. W d could would you care to explain it? How? Okay. Interesting. Okay um, well, we're not gonna the management has decided we're not gonna work with that. Um Okay um and we're also gonna w like your question earlier um whether this is going to be t for television, video, or etcetera. Just for television. That's what we're focused on. Um otherwise becomes to complex, we wanna get this out um very quickly. We only have a a short amount of time. Um and finally there's more marketing, I think, um, our corporate image has to be recognisable. So while we're gonna make it look pretty we need to use our colour and our slogan i in the new design. Looks like, yeah, kind of a yellow and black and we have that the emphasis on the R\_s in um mm-hmm. But it's, yeah, we put the um fashion in electronics. So we gotta keep that in that in mind. Yep. Yep. Yeah, or ha maybe some buttons could be yellow. Like, we can we can play around with it a little bit. Um. Okay, we need to talk about our functions and our target group. We need to decide who our target group is. You um in your analysis of different market um of the marketing, you identified that different groups wanted different things or had certain preferences, for example that um that older people didn't really care for um voice recognition, but younger people did. Um and so who are we aiming this at? Mm-hmm. It's gonna be twenty five Euro remember, so um it has to be avai marketable to um whomever it is. Well at least right now what we're doing is um deciding on just the remote itself, so it will probably be sold separately, twenty five Euro by itself. Now, those are that's all specific for speech recognition. Are we gonna use that as one of our functions? Mm-hmm. Mm. To produce it, yes. Mm. That's a good thing to keep in mind. Upgrade? Well, we can look for we can look at upgrade or we can look at um user-friendly. Simplification, so Uh-huh, mm. And we also need to talk about if we're only gonna have the very simple ones or also have the other ones just separate somehow or Kind of pull out of the side. Mm. Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Um we have to be careful that that that doesn't impede um the chip transmitting information, but

um that's gonna be mostly technological thing. Um. Okay um, so what are we emphasising? I what in this project? Simplicity and fashion. Okay, those are very good goals, I think, um that we have to keep in mind in with everything we do. Simplicity and fashion and, yeah, or usability speci however you

wanna say that, which includes um an emphasis on making the infra-red very functional, so that you don't have to travel around a lot. Um. I think it's a lot to do with battery, but that's just my Mm-hmm. So our target group, we're saying, fifteen to thirty five? S voice recognition, which I kind of I kind of feel like voice recognition is not necessary in a remote control, like it might be necessary for a T\_V\_ but not for the remote c, you know. Seems a little bit Mm-hmm. Yeah, and it might be too expensive. Mm-hmm. Yeah. Mm-hmm. Under sixty five, okay, that's a good start. Um. I'd say we're uh can we narrow it down to maybe um teenagers and families? 'Cause that would go up to like fifty? Okay, single It's it's hard to narrow it down. Mm-hmm. Okay. Mm-hmm. Right. Mm-hmm. Mm-hmm. So maybe it's more useful to d d to define objectives like fashion and simplicity than to find specific target group as far as age is because, yeah, things so different will appeal to different people, but Okay. Um oh, there're a couple functions do we want something so that do we want some kind of thing to find it if it's lost? Like a button on a T\_V\_ you can press and it'll ring or something, I don't know like or beep? Mm-hmm. Mm. Okay, we have to we have about four minutes left to define our functions. So let's do that quickly. Um so we want something to keep it from getting lost. And we want um we want large buttons for the essential things. Large, accessible buttons for the essentials. We want a possibility to um to get um a possibility to get the extra functions. Mm-hmm. Um, yeah, hidden way. And we also want it to be fashionable, which I'm not sure if that's a function so much as a um yeah Mm-hmm. Okay, do it. Any other essential functions that we need? Battery? Do we need a long-life battery? But we might as well. Yeah, I would imagine. Just 'cause it is an electronic device, the Charging. Mm-hmm. We have to think about um space in living-rooms, too, like 'cause they're I mean, would you put it on top of the T\_V\_? I don't know, just think okay, that's that's a good idea, we'll keep it. Think it's And maybe fun. Okay. Um 'kay we're gonna conclude now, has everyone said their functions and 'kay. Um after the meeting we're gonna each complete a sks um a questionnaire and a summaries summary. I don't know what summarisation. Um and then we'll have our lunch break. After that we have thirty minutes of individual work. Um I'll make sure to put up um the minutes and the project documentation and including these PowerPoint slides. If everyone could do that as well, that'd be great. Um you each have individual actions, I\_ um I\_D\_ Industrial Design you've your components concept, User Interface, the user interface concept, market trend wa watching. And as as per last time you'll get specific incrat instructions from your personal coach e-mailed to you. And hopefully, I hope, next time you'll be able to access more of the web site that they they seem to tell you that you could. It's kinda frustrating, but um Be sure to note any frustrations or any um issues that come up in your um in your um summary. Mm 'kay? Great seeing y'all. Looks like there are um looks like there's a second one kind of of mine that's that I didn't do, it's from like an earlier project, I think so um Under the shared folder, I don't know it might not even be under yours as well. Projects. Okay. You don't have mine? S Mm. Okay. Well I'll figure that out in the meantime. Okay.

---

# Meeting ID: 16

Data Source: Train

## Executive Summary

The project manager had the team members re-introduce themselves and then briefed the team on his own duties and on the meeting agenda. The industrial designer discussed the interior workings of a remote and the team discussed options for batteries and infra-red signals. The user interface designer discussed what features the remote was required to have and presented two existing products which were based on different concepts. The project manager then introduced some new requirements to bear in mind when designing the remote. The marketing expert presented research on consumer preferences on remotes in general and on voice recognition and the team discussed the option to have an ergonomically designed remote. The project manager briefed the team on the decisions made so far and the team discussed color options for the remote.

## Complete Meeting Transcript

Think we can first. Right. I just wanna 'cause basically I can't re I've really crap at remembering everyone's name so I just wanna rather than going uh Miss Marketing and Miss this and Miss that wanted to know your names again. just gonna leave this up here 'cause I'll you know. So Okay, and Gabriel. E\_L\_ is it? 'Kay. And you're s r R\_E\_I\_S\_S\_ Okay. 'S just a bit nicer calling people by their names I think. Uh, right. Okay, right, welcome to meeting B\_. Um this is gonna go a lot better than the last meeting, basically, uh 'cause I know what I'm supposed to be doing now. I am your Project Manager, and, uh yeah, I'm just here to sort of liaise between the three of you and get things going, get people talking and and I'm gonna be making notes and sending them off to the powers that be and stuff basically. Um right, this for the purposes of this meeting what this meeting is all about is um I'm gonna have some presentations from all three of you, what you've been working on for the last wee while, when you haven't been getting hit with spam on your computers and and, you know, filling out silly questionnaires and things. But hopefully you've been actually been doing something productive. So we're gonna each of you gonna give us a litt a little presentation. Um. Then we're gonna work, you know, from each of your presentations. We'll we'll uh talk about what we actually need as a final coming together of it all. Um and then we'll, yeah, we'll sort of conclude anything else comes up at the end of it.

This meeting it's not very long. It's uh probably down to about thirty five minutes now. So I want each of your presentations to not be too long, five five minutes, something like that. Um if you haven't done a PowerPoint thingy, it doesn't matter, it just it just says that you it's that's just one particular medium. If you haven't had time to prepare one, you can draw stuff on the noteboard, you can talk to us, you can you know however you want to do your little presentation, basically, you can. Don't feel pressurised into using this thing. 'Cause I don't. Uh okay. So um. You okay over there? Reissa, are you uh b are you joining in with this meeting here or are y or are y or are you are you just are you just uh doing some Internet shopping there? Okay, jolly good. Alright, let's have um well, we all know that it's it's a remote control that we're gonna be dealing with. I think the first thing we should look at is um probably the um what it is that it is actually supposed to be. So that's gonna be you Catherine, if we wanna hear from you first. You don't have to worry about screwing it in just there you go. Ah. Mm-hmm. Mm-hmm. Great. Okay. I prefer the pe I prefer the human touch personally. Yeah. Do you wanna just give us a moment, I just wanna copy this down. Um I dunno if you guys have got any questions for Catherine on any of this? Yeah, you blow on it and i Yeah, it's worked for the last fifty years you know. How far away is your television? It's never gonna be more than it's never gonna be, you kno unless you've got a T\_V\_ the size of a football pitch, it's not doesn't have to go that far, does it? Doesn't have to go through a wall, because you're not gonna be looking through a wall. Yeah, yeah I d it sounds like you you w don't wanna overcomplicate things. You know we don't need it. Yeah, exactly. Basically, we're we're desi we're designing and marketing a television remote control unit. We're not w w w w designing something that you can plug in a headset to and and you know connect to your laptop computer and stuff. It's uh Okay. Right, well done, Catherine. Um Gab Gabriel let's uh let's hear from you on on on such things. Mm-hmm. Mm yeah. Okay. Mm-hmm. Yeah. Great. Yeah. Great. Okay. Now that's I just have a q a q question for you. This w um research that you've been doing looki looking at other, you know, existing units stuff. Um have you found that anyone else has do has looked into the locking function or Yeah. Yeah. Um I

would say it's If it's simple to do, which I think it probably should be, even if it's a physical, you know, a f a like a f a physical switch or a physical cover for the remote, even something like that, um then yes, it's like, you know, like s you said earlier on ab ab ab a flip thing, something like that, but you know being physical. Look into. Um I've had word down from head office that something that we should be centred well, something we should take into account is um we've gotta keep the corporate image within this remote control unit. It's gotta d look like it's in the R\_ and R\_. You know, the the company it's it's, from what I can see from our other products, are yellow with blue writing on them. Um. We put the fashion in electronics. There you go. So it's kinda gotta look it's gotta look new and s you know something fashionable. If if remote control well, if telephones can be fashionable, then maybe remote control units can be. Yeah. Because we need Yeah. Great. Okay, fantastic. Right, well done, Gabriel. Um Reissa. Let's plug you in, baby. Yeah, w it it just takes a wee while. 'Cause we've only got five channels. I think that's k flicking quickly between channels. Yeah. Wow. You are a child of technology, aren't you? So there you go, yeah. Uh but do the younger generation have the money? They they don't. It's older generation, they're the ones that have gone out and People people from the age of thirty f there's a big drop off there. For people up to the age of thirty five, you're kinda saying, yeah, they want it. Um but no they're not sort of most people that have the money are people from the age of thirty five to fifty five, uh 'cause they're the ones that have been working for twenty years. Um d and tha and that's a that's quite a minority there, so yeah, it's not even like fifty fifty that's th thirty five per cent. Yeah. I would say scra I'd say scrap that straight off. So y so it's so it's so you got so that's something we should have a look

into then i when desi when designing the ergonomics of see have a look if um there's any w any medical background we can find out about this. Let's jus we just want need to cover our arses so that people aren't gonna sue us in ten years' time, say your remote control gave me repetitive strain injury. Yeah. They're having a lunch break at the moment, but yeah. I'll see if I can get see if I can get hold of them for the next meeting. Yeah. Okay. That's great, thank you very much for that, Reissa. Um okay, so we've basically we've decide we've d we've decided that it's gonna be, you know uh, we're going for a basic television remote. It's gotta be safe to use, it's gotta look cool. It's gotta be cheap. S um. Now going back to the uh industrial design of it, you know, we were looking at whether to use maybe infra-red or Bluetooth. I think, we should just go with the simplest option on everything, uh and that would be infra-red, energy source, that would be batteries. Uh mean we we can look into using the s, you know, the little tiny weeny batteries, all like special long-lasting batteries. Um. But a in there's no I don't think there's any point in making a remote control unit that's gonna last for fifty years, because technology will have changed and, you know, we won't have televisions in ten years' time. So I think we're all um pretty sussed on that. Um anyone have any questions? Everybody happy in their work? Now this is good, we've got a good structure going on. We all know where we're going to. Have you been ge has have any of you lot been getting loads of crap spam on your computers? Yeah. Yeah, stuff. Um okay. Do oh have you guys found out if we can if we can e-mail stuff to each other? Right. Do all you all know my e-mail address? Can you all d e-mail me your e-mail addresses?. Send me, yeah yeah, okay. Is it yellow and black or is it yellow and blue? I I kind of thought it was blue writing on a yellow background, but I might be just going a bit Okay. Well, maybe you

can come up with a few with a couple of different ideas? Well, see the thing is is we've gotta keep the company image. It's gotta say people have gotta look at this remote control and instantly recognise that it's a Real Reaction i product. There's loads of companies that called R\_R\_. This is slog but this is the slogan, this is the the the the type. Yeah. Well, not necessarily. But we have to incorporate it. Not necessarily even if i it just has to ye but you have to look at the product and instantly know that it's one of our products as opposed to a Sony product or a, you know, a Panasonic product. It's got to so maybe, so you can have a look at our our other products and see if they all follow a s similar vein, perhaps. Yeah. Yeah. Quite poss yeah. Well this is all your department. Mm okay. Well, well done everybody. And um, I think we uh stop for lunch now. We might possibly have done. If we've if we've finished at five minutes before the meeting's supposed to finish, then that means we get an extra five minutes for lunch. Yeah, there you go. Right. I just have to there's a few little bits and pieces I have to write down, but Take your headsets off, kick back, smoke 'em if you got 'em. . I am Reissa.

R\_E\_I\_S\_S\_A\_. Double S\_ A\_, yeah yeah. Sorry. Mm 'kay. Mm. I'm fine. Yeah. I uh yeah, yeah. D I mean, I I'm finishing off my presentation. No no. Uh I'm done. Okay. Mm. Is a battery like the only way of No, no No I meant like No 'cause like cha 'cause always changing um um batteries can get like annoying. The battery's down and maybe, I dunno, solar charged? Mm. Yeah. Yeah, but if like you're on the phone in the other room and you need turn television off or something and you don't really want to go into the put the telephone down, and go into the other room. How about Bluetooth? Instead of using infra-red, use Bluetooth. Isn't that a better signal? Mm. Mm. 'S just an idea. Adjusting. Yeah. Mm.. Mm. Mm. Mm. Okay.. Where does it go into? Here? The blue thing.. Well, function F\_ eight. No oh. Come on. Right. Okay.. Okay. Well, for our marketing report uh we observed remote control users in a usability lab, and also gave so this is research and we also gave participants um questionnaires to fill out. Um total number of people tested were a hundred just so you know, so that hundred people were tested and these were the findings. So seventy five per cent of users find the remote control ugly. Okay,

so they don't like the look of the remote control. Um eighty f eighty per cent of them would spend more money if the rem remote control looked really cool and fancy. So I think we all agree with that. Um current remote controls do not match well with the operating behaviour of the user. So, they don't like like the way they operate it doesn't like match how people behave. Um per cent of the users say that they only use ten per cent of the buttons on a remote, so probably if you have like one, two, three, four, five, the whole up to z ten, they probably don't use those, they only use the up and down channel. exactly. That's another thing. Um seventy five per cent of users say they zap. Not quite sure what they mean, zap, goes like. Yeah. Mm. Um takes too much time to learn how to use a new remote. I think especially for uh the older generation. I know my grandmother doesn't like mobile phones, takes ages to work how to use. Anyway um and they also remotes often get lost in the room, so nobody can find them. So maybe tracking devices is a good idea. Um personal preferences. Um so yeah um I was thinking something easy to use, especially for older people. Um has to look really cool, flashy groovy for people to buy it. And it's easy to find, so I don't know whether maybe and also we asked them whether they wanted whether they'd be interested in um voice activating. So voice activation. So and this was what we came up with. Then if you look fifteen to twenty five this is age, sorry, age groups. So fifteen to twenty five said like ninety two ni

nety one per cent of them said yes. Um so basically the majority except for the forty five to fifty five year olds for some reason didn't want a voice activated one. And neither did the older generation, but the younger generation who we are catering for, like who have most of the money nowadays, do want a voice act speech recognition in a remote. Well the twenty five to thirty five year old, and thirty five, and the thirty five to forty five, forty five point seven per cent say no, so So they don't Well These guys are growing up. Voice activation might not be the best. Um also with um with buttons, a thing called R\_S\_I\_, so wrist sense Huh? Yeah, repetitive strains injury, so they don't I think people who watch T\_V\_ maybe too often, keep changing channel hurts their wrist. I don't think so. Yeah maybe not so hard. Yeah. Maybe Mm. Yeah. Mm. Maybe th the buttons not so high up so you don't have to press so much, or we just like flat buttons, something. Yeah. So that is me. Mm. Mm. Mm. Well, just questionnaires. Yeah, you can. I think he's participant one, aren't you? Can't we have different colours in the remotes, so somebody can choose different col like does it have to be of a certain? But if it's a R\_R\_, it would be Real Reaction, like if it had a symbol on it. Whoa. So we have to have it one colour. Mm. Mm. Mm. Are we are we finished ahead of schedule? 'Kay uh. Right it was function F\_ eight or something. This one right there. Okay. Think we all Huh. Oh I thought we all were. Yeah, I have one too, okay. S Whoops I forgot to put the thing on Okay. Yeah. Sure, that's a good idea. Uh Gabriel. E\_L\_. Think she's finishing up her presentation. Oh. Yeah, alternate energy source, like win wind power or Bicycle power. One question I have, and I don't know how much control we have over this is um, as far as the infra-red signal, do we have control over, you know, how far away you can be from the receiving unit, the the T\_V\_, and still have it be operational? I mean, maybe we want one with a strong signal stream. Uh That's true. Okay. Uh I'm just gonna use the PowerPoint uh. Technical. Okay. Okay, so, while this is warming up, there it is uh. So I'm doing the user interface design. Yeah, and basically uh, as far as methods, I was I was looking looking at looking at uh already existing remotes, trying to find some inspiration from designs that are already out there. Thinking of what we can retain, what we can do away with, uh what we what we can perfect a little bit as far as design um. we don't want to do something that's too radical of a change, I guess, I mean people want a remote that's familiar, that has their favourite functionalities um and and does the basics, but Um so we can improve what's out there and maintain that, the basic functionality that people want. Um so things that seem like absolute

must-haves uh would be a volume control, um so up-down keys for that, uh channel keys up-down, but then also a numerical key pad so that they can just key directly to the channel that they want, rather than doing up-down, and uh a mute button. Uh one thing that I didn't include here, that I forgot that we talked about last time, was doing um some sort of lock uh function. Uh, I don't I dunno, uh that's one possibility. And so in the research that I was doing there's basically two types of remotes, ones that are engineering centred and ones that are more user centred, which I don't know if I can access the web page from here, but I can show you uh. Yeah. So this is a engineer centred one, so you see it's rather busy, but it also lets you play your movie, stop your movie, fast-forward, all this, um freeze frame. Uh and this is a user centred one. Uh it's it's easier to g just glance at this and see what's possible to do, you're not gonna be staring at it for five minutes. And I judging from what what we all talked about during our last meeting I kind of gathered that that's what we were going after, uh or the direction we were going in

at least. Um. So, the engineering centred ones uh provide a lot of functionality, but it can be a little bit overwhelming, so the user centred ones just focus on ease of use. Uh and this sort of overlaps with what the marketing person uh, Reissa, because uh we we need to find out what what people want before we make firm decisions on this. So uh, yeah, that's me. No that that that seemed like a novel idea as f as far as I know. I mean obviously another exists like you like you said in in mobile phones. That was sort of the inspiration for it. Um I've never seen that with in in all my years in in the remote business. I've, haven't I've never seen a locking functionality. I dunno, what uh do you guys have a a yea or nay on that a feeling about whether that's really necessary? Yeah. Mm-hmm. 'Kay. Right. Mm. Right. And our motto is is we put the fashion in electronics. I think I think we have to carry that mental. Mm. Well yeah these, I think, we can so we talked about the layout in my presentation and what I didn't mention yet really is is the sort of like the ergonomic design. I t I think we can make big improvements over these two that you see here, I mean. Uh, everything is going t ergonomic, you know, there's you know mice for your computers that are very ergonomic and keyboards and that could be one of our niches p sort of uh uh in the market, I guess. Um.. Yeah. Uh, yeah, this is getting all. Mm. Yeah, then you just have to do function F\_ eight and it should come up. Yeah, it just takes a second uh. Yeah, you wanna navigate the channels quickly I guess. Mm. No I would I would say the older the older people, yeah. Yeah, that would be my guess as well. What about just from the the prospective of our manufacturing cost? I mean if it's twelve fifty per unit. I mean, okay, there's Uh. Repetitive strain uh rep repetitive strain injury or like from doing Mm. Mm. Yeah, we should probably consult with our legal department uh. Yeah. I think we can do some really in in that department, the the ergonomic department, we can make some some really good improvements. Mm. Yeah, it seems like we're all on the pretty much on the same page. Oh it's probably just you, 'cause you're the project manager. Sell trying to sell your things. Okay. No I don't. I Uh Oh, it's just participant one oh okay. Yeah. Well it's just w it's just it's just par participant one, participant two. So are we headed towards like a b a big yellow and black remote as far as maybe that's our next meeting that we discuss that. Well, it's like white on i white and blue on a black background with white with yellow borders. Maybe that's like getting ahead of ourselves. Mm. Mm. Mm. Mm. And this is something that came on down from from the higher ups, so, I mean, we are sort of beholden to them. Not one colour, but the pattern needs to be recognisable.. Yeah, pretty soon I think, I guess that's now. Alright, see you all soon. Mm. Tha Okay. Who is gonna do a PowerPoint presentation? You will as well? Okay. Yep. Okay I'm Okay. I'm Catherine with a C\_. C\_A\_T\_H\_E\_R\_I\_N\_E\_. Right. True. How long is the meeting? Okay. No problem. Okay. Okay. Um just connecting this. Are we getting i Really? Okay. Cool. Okay. So I've got a very quick uh Uh. Okay.

So the working design, I've got a very quick presentation on this, so um I've oh no, you can't see a thing. Oh well, I'm gonna draw it on the board then. It's in blue uh, and I couldn't change it. We it's fine on my screen, but never mind. So um the idea is that we've got the energy source um, which in our case will pr, oh well okay, never mind. So um I think maybe uh two batteries, I dunno what they're called six, or something like that. Uh and then um then on the uh remote control itself will have um the sender for the signal, which could be uh an infra-red signal, um which will be sent by an electronic chip. And uh the chip will be controlled by the user interface. So we'll hear about that later from Gabriel. And uh the sender will se

nd to the telly itself an infra-red signal to tell it to switch on or switch channels. Um and that's it really for the working design. Sorry the presentation wasn't very uh clear but Really? Cool. Um, should I erase this or Okay. Fine. Or suggestions? Well, it's just, you don't want it plugged in really, s In indoors. I dunno, swi I th I th I think changing your batteries once every six months is not really a pain, but Yeah. Well, the thing is uh you you don't Well, we can make the the signal strong enough to go through walls if if you fancy it. I didn't think about that but Why not? I just think that it's it's gonna cost more and I'm I'm not sure it's you're gonna use it. It's a fancy idea uh it's quite nice, but then I don't th I dunno, either you if you wanna watch the telly you're in the room, you are gonna But Oh, we can we can keep the idea if you i We can see at a later stage, maybe, I don't Do you need the border? Okay. Sorry. Well maybe they shouldn't watch so much T\_V\_ then. Maybe it could be, instead of pressing button it could be just touching a Yep.. Well, in the project announcement, you've got the addresses, I think. So Project Manager, it's participant one at A\_M\_I\_. You have them i you have them, but we'll send you an e-mail. You want to have friends, don't you? It wouldn't be Well you could It could come But it could come in different colours and have the R\_R\_ colours just somewhere like just around the lock button could be the R\_R\_ logo or colours and If. Cool.

---

# Meeting ID: 52

Data Source: Train

## Executive Summary

This is our final meeting , the detailed design meeting . what we have to get through in this meeting is firstly the prototype presentation from you two , It does look very cool . then Cat's going to present the evaluation criteria that we're going to be evaluating this against . Then I need to say some st a few things about finance , 'cause we have to check that it's within the finance criteria . Um and then we'll be making sure that our product fits both the evaluation criteria from Cat and the financial limits . Um and then we uh will have a brief evaluation of the whole process of production and design that we've been through . so will you maybe start with like the mm the shape and things Okay . So um basically going with our trend of vegetables and we selected the colour and approximate shape of banana . You think bananas are a safe thing to use ? Well , but it's it's just an a approximation . Um so basically it's the it's the flip open thing again . And it flips open on the side , so it opens like that . And we have the user interface o in here and uh the the L\_C\_D\_ and and the scroll are inside . And it's the whole thing's made of rubber , is that so I would say that this curvy does look quite like a vegetable . yeah , but um one thing we actually kind of um forgot while designing , that one side was supposed to be rounder , Is it to scale , or do you think you can make it a bit smaller ? Um it could be made a bit smaller , So so uh the user interface as as we discussed last time uh mm on on the on the cover we just have the very basic things . So we have that n uh channels here starting from um uh one two three So it's four , up to four , up to seven , up to nine and zero , z zero here . And then , well this is on off button . and and also the colour is quite often red , And then these ones would be for flipping the channels back and And and we would also have a l little um thing saying here , previous and ne prevon prevon next . The volume is is scrolling . On the side , And and and it's it's on the back is mm cover or back lid , because if you flip it open , you can still do the scrolling here . and and you have the mm spinning wheel with options to choose . Oh , the thing we forgot was like a mute button . Well , we'll have this on the screen , on the display . On the wheel , like if you hold the wheel down then it will mute . Uh on the L\_C\_D\_ we r you know , the main menu will have various options . yeah , the scrolling is kind of you have to scroll all the way to make it mute , right ? if it's a scroll and click so you hold it in ? But if you hold it in , And okay , so i so the the voice recognition is also just part of it . You can't really see it in the interface . And it's with the the black and yellow you're even in the right colours . Yeah , I think um we could do l the logo in grey , as it is on the website . I suspect we're gonna have a couple of minor finance issues , but um we'll se I'm

sure we can get around them somehow . So what we're gonna do is prefer prepare the evaluation of the new design . Um so we're gonna be using a seven point scale , so one is , you know , yes , it totally meets with that requirement and seven is , no , it really doesn't , we need to go back and start again . Um , you know . Basically , what I did was I went through all the like user requirements and things that we've done and we've worked on and like made a list of them . So for each of these we need to give it a one to seven . I did have A\_ , B\_ , C\_ , and D\_ down here , but it seems to have turned into like just bullet points . Okay . But if you can imagine that they say A\_ , B\_ , C\_ , and D\_ , then that would be really good . Okay um uh what I've done on the next page is I've set it up so we just put the marks in . If you take a note of them , left-handed people can't normally write right-handed , Um the the only thing that we were considering was that uh this thing is kind of more for right-handed people than for left-handed people , Does it match the operating behaviour of the user ? so y so we we might do we might want to do like a uh another m model another another version , which is like exactly the mirror image of this one . So maybe we need to put that needs a little bit of investigation , maybe give it a five , I would say ? Or maybe six , It might be a little clumsy when when it opens up , right , I th I think the alternative is flipping from the top . Yeah , but we which makes it kind of really big , yeah . or are we saying we're gonna stick a locator on the T\_V\_ ? th there's the locator dot . Mm that you stick on T\_V\_ . so that means you need a that does mean you need a little speaker on it though , To make it beep . so that's seven , yeah . If uh uh if this means intuitive , if it means the way people kind of are used to finding things I'd say six , 'cause the I mean the the standard layout for numbers is three three three and one , rather than the way you've got it . but it's not the immediate thing that you're used to . but uh it's a good technology , I mean once they get used to it . So , should we maybe say f a five so possibly for left-handed . Investigate . But otherwise it's superb . So , should we give it a six ? Um uh the ergonom ergonomic design well mm I mean I d uh I dunno , I mean the the repetitive stress things , but then who would be really pushing the buttons so much on the on the remote control anyway , And moreover it has um L\_C\_D\_ and everything , so that uh you know uh we minimise the pressing of the buttons anyway . Okay , so we give that a six , G\_ technologically innovative . it's the most sophisticated remote that I ever seen . Well mm we have we have the sample speaker as well , which is yeah , it's kind of new . All of the components have been used in other things before . They're never been used i they've never been using remote remote control before I don't think . What do you reckon , five , six ? Six . Put fashion in electronics . Fruit fruit and vegetables are fashionable these days , so . So , we need the average here , So I think we've done very well , The average is about six and something . Six point five , yeah . that's pretty good , I think . so we've looked at the prototype presentation and the evaluation criteria . And now we have to calculate the production costs . So I've got an Excel spreadsheet to help us do that . Um I started filling it in , No hand dynamo , right ? One simple battery . The chip , we're going for an advanced chip on print . We also said the sample sensor and sample speaker . Um single-curved surface , so that we can fold it . Case material we said rubber . I don't know what special colour means . I think something coloured , but rubber comes coloured , doesn't it ? You know . maybe it's like if you want titanium coloured or wood coloured , it's different . Or maybe maybe if you want some kind of pattern thing on it , We have pushbuttons , Scroll wheel with pushbutton we had , no ? And we have L\_C\_ display And button supplements . Yeah , but what do we ha we have L\_C\_ display , but but the wh but the s spinning wheel We've got more than one pushbutton though , That

means you can only have twenty five push buttons in total doesn't it ? That seems unlikely . whether whether pushbutton means that p count by button or do we We have to count all of them , I don't think that makes sense . if it is pushbutton then you got a zero point five , it's a scroll wheel so we we've put it's pushbutton and scroll wheel and L\_C\_D\_ display , So , as we can see , that's way too expensive down here . Our budget's twelve point five . Yeah , the sample sensor will have to go , 'cause that's the most expensive thing on there . so that has implications though for the . Uh it does not have for voice recognition , but it does have for the feedback speaker . when you say when you press one it says one or it says hello . But that's a bit of a gimmick anyway really , isn't it ? Mm and the locator also goes away . Well the speaker uh the sample speaker is is expensive , but we could just have some some very very easy device that just beeps . A also i in the case I'm not sure that you will evaluate this as a curved surface , because it's just rubber , so it's probably a flat surface rubber . Right , so we need one fifty off . Take it down to just a scroll wheel . in the L\_C\_D\_ we can scroll , right ? how do we how do we make a selection in uh in the L\_C\_D\_ ? But how do we make a selection if we cannot push the button . you can push this one , but we don't have a pushbutton uh we ca we don't have this muting mechanism for this scrolling thing . So that's point three . and I thought we were referring to this as a scroll spinning wheel and pushbutton thing . The scroll wheel is on the side . We're point three over at the moment . Unless we just take off the scroll wheel altogether and just have pushbuttons for the volume . Instead of scrolling here we have two buttons here , up for up and down . Oh look , we're way under budget Yeah , well we could admit to the single curve , couldn't we ? Or or that we have to have some sort of special colour . So did we lose um on our evaluation criteria , as a result of doing that ? No , I don't think so . Because we keep all the features , we keep voice recognition , we keep L\_C\_D\_ display . instead of having scrolling we we just push the buttons . But we lose the locator . so we still have the locate . We're gonna have a beep . It can come in the same colour as the the case . so it would be good if we could just have a little talk about the project itself and how it went , um so that we can feed back to the management for next time they're designing a product . as far as creativity is concerned , yeah I think there was there was room for creativity . The only the only problem being that at the end we had to cut some things down because of the the budget we had . I think uh n one thing that was lacking uh was that we did not know what the various things cost to begin with . If we'd had that sheet at the beginning should've been like , okay , so we can have that lot , let's just throw it together and do what we can . But in terms of the process of um going and working individually and then coming back to a meeting , that that worked in terms of . I think 'cause the meetings were so regular , you know . Yeah , the m the means were very very good , the means we used . the whiteboard digital pens . We like the pens . But that worked well having having a whiteboard that we could draw on as well as having the PowerPoint , I was I was satisfied with with the leadership , yeah . Yeah , and and and this time also the time limits but actually preparing the I mean especially with that last-minute alteration . I mean that was fairly tight anyway , But yeah , but I mean already just just preparing the slides before before the meeting , yeah . You weren't like a a dictating leader , so that was always good . And then the teamwork I think I think it worked quite quite nicely , yeah . Did anyone feel that they were getting sort of covered up and not being able to say their bit ? Mm . I guess it was a fairly small group , so all of us got to express our opinions , yeah . New ideas found . Not quite sure what about . Well it's it's it's pretty new , I think we'd like to think the ideas were new , costs are within budget , One Euro left over for bits that we

didn't foresee . Um we've evaluated the project . Can you put that in the project documents file ? And the process wheel didn't really have any major problems with . And my main difficulty was the the time pressure . sometimes it's like a little bit rushed . we've got like five minutes left . but if we've finished , then we've finished . Yeah , it was a pleasure working with you . So I would say that's the end of that meeting . Right , so we have to complete the final questionnaire and meeting summary when they send it . Was there a questionnaire already sent ? Do we have to go back into the other room or can we stay in here now ? I don't see why you can't stay here , really .

## Complete Meeting Transcript

Yeah. Yeah, about four fifteen, yeah. So, you said um are are we starting with the the so will you maybe start with like the mm the shape and things and and then I will explain the the user interface th uh things, like the buttons and the scrolling things and Well, but it's it's just an a approximation. Uh yeah. Rubber. Yeah,. Um it could be made a bit smaller, and and of course it would be and yeah, but um one thing we actually kind of um forgot while designing, that one side was supposed to be rounder, so we said the back side round, yeah. Yeah. Yeah. And it's spongy as well. So so uh the user interface as as we discussed last time uh mm on on the on the cover we just have the very basic things. So we have that n uh channels here starting from um uh one two three there would be numbers in in the on the actual one. So it's four, up to four, up to seven, up to nine and zero, z zero here. Yeah. And then, well this is on off button. It's it's quite standard mm place for it and and also the colour is quite often red, so it's it's kind of user friendly. And then these ones would be for flipping the channels back and like the previous one and the next one. And and we would also have a l little um thing saying here, previous and ne prevon prevon next. The volume is is scrolling. On the side, this one. Yeah you just do it like this. And and and it's it's on the back is mm cover or back lid, because if you flip it open, you can still do the scrolling here. See? So the volume is you just scroll, but then once you flip it open, okay, there there you have the screen and and you have the mm spinning wheel with options to choose. You can move back and forth and then if you need to m choose something on the screen, you just push the cen mm the middle button. A mute button. Well, we'll have this on the screen, on the display. Well, but the but the mute yeah, the scrolling is kind of you have to scroll all the way to make it mute, right? Okay, yeah, okay. Yeah. And okay, so i so the the voice recognition is also just part of it. You can't really see it in the interface. Yeah. And we do have the logo on it as well. So I think it Yeah. Yeah, I think um we could do l the logo in grey, as it is on the website. In the actual one. Yeah. So if you have questions. Yeah. Yeah, the yeah, it's definitely attractive. Oh, the locatable thing we actually forgot. Yeah. Shall I just prepare it now? It will be red, too. S seven was th the maximum, yeah? I l go for seven. I would think yes, yeah. Yeah, so y so we we might do we might want to do like a uh another m model another another version, which is like exactly the mirror image of this one. Yeah. But then then I think left-handed people are already used to discrimination anyway, so they just Yeah. Yeah, because I mean anyway, right-handed people would be able to scroll with it, so i if the majority are right-handed, it's uh Or maybe six, because it's just one one i one among the issues, I mean. Yeah. Yeah. No, yeah, but mm but we have it nicely with the hinges here yeah. So it won't be a problem, it will be and it will be it won't be heavy. Yeah well yeah, but it's it's a bit long. It's a little bit long. Well, I mean it can be

opened like this of course and yeah. S uh slightly smaller. Yeah, but if we flip it open only as much as that. Mm that you stick on T\_V\_. Yeah well w but I but the speak sample speaker is included, so it has some capacity to mm to do some to make some sounds, so yeah. Yep. Yeah. If uh uh if this means intuitive, if it means the way people kind of are used to finding things and it's I th I think it's Yeah. Yeah. Um uh the ergonom ergonomic design well mm I mean I d uh I dunno, I mean the the repetitive stress things, but then who would be really pushing the buttons so much on the on the remote control anyway, yeah? See. Yeah, so it's kinda Yeah. Yeah, it does have yeah. Technologi well Yeah. Well mm we have we have the sample speaker as well, which is yeah, it's kind of new. But

at the same time they are all they are all relatively new. Six. I mean how how far can you go with a remote control, really? It still has to do what i what it has to do. Yeah, isn't it fashionable? Yeah, sure. It's the maximum fashion. Fruit fruit and vegetables are fashionable these days, so. So I think we've done very well, but What's the assessment? The average is about six and something. A little bit over six. No, wait, a little bit under six. No, wait. Oh, three sixes, okay, yeah. Four sevens. Six point something, yeah. Six point five, yeah. Yeah. Yeah. Yep. Yeah, yes. Rubber. I think something coloured, yeah, probably. So I think this is probably special co no? Yeah. Or maybe maybe if you want some kind of pattern thing on it, yeah yeah, okay. Yeah. We have pushbuttons, scro we have scroll wheel as well. S yeah, yeah, we had, for muting, yeah. And we have L\_C\_ display and yeah. Um Yeah, but what do we ha we have L\_C\_ display, but but the wh but the s spinning wheel Yeah. Okay, let's yeah. We have to count all of them, or yeah. But it was very no innovative innovativeness. Well um yeah. Well the speaker uh the sample speaker is is expensive, but we could just have some some very very easy device that just beeps. This would be Yeah, yeah yeah there you record your samples your speech samples and Yeah, then then we would be in the b budget. Yeah b no no, you can push this one, but we don't have a pushbutton uh we ca we don't have this muting mechanism for this scrolling thing. Mm-hmm. But I mean we can put an additional mute button on the top as well. If you Mm. So Mm-hmm. Okay, yeah. Okay. Yeah. Well we're going to have a beeping thing. But yeah, it's it's not like sample speaker, but it will just beep, so we still have the locate. Which colour, the the colour of the phone or the colour of the But it can be yellow as well. It can come in the same colour as the the case. Yeah mm, as far as creativity is concerned, yeah I think there was there was room for creativity. The only the only problem being that at the end we had to cut some things down because of the the budget we had. Yeah, yeah, yeah. Yeah. Yeah, the m the means were very very good, the means we used. And the pens. Yeah, yeah. Yeah. Yeah, and and and this time also the time limits but actually preparing the Yeah. But yeah, but I mean already just just preparing the slides before before the meeting, yeah. Yeah. Yeah. I was I was satisfied with with the leadership, yeah. Mm-hmm. And then the teamwork I think I think it worked quite quite nicely, yeah. To express them mm mm no. Well it's it's it's pretty new, pretty novel solution for a for a remote control really, all this flipping open thing and Yeah, neither neither do I, but I've never seen anything and and none of my examples were was was like this, actually, so. Yeah maybe w maybe we could have a patent on this one. Patent patent patent. Mm. Mm-hmm. Yes. Yes. And my main difficulty was the the time pressure. Otherwise it's it's all fine. Yeah, yeah, yeah. Yeah. Yeah. Yes. Yeah, it was a pleasure working with you. You can make some animals. Oh, you don't like anim It doesn't? Smells quite nice. Smells very sweet. I made your animal for you. Yeah, that's the one It does look very cool. And then do we get to make a remote control? Yeah. Yeah. You think bananas are a safe thing to use? It's a bit um phallic. Oh, your remote control? Oh that's just bad. Is it to scale, or do you think you can make it a bit smaller? Yeah. It I does look like the curvy and then the whole shape's curvy, so I would say that this curvy does look quite like a vegetable. I wasn't

very keen on that, but yeah. So where's the volume? Ah, you did get that in then, mm-hmm. Oh okay,. Cool. Oh, the thing we forgot was like a mute button. Yeah. On the wheel, like if you hold the wheel down then it will mute. Yeah, but it's a scroll and click, isn't it? Okay, cool. So that that solves the whole mute issue.. Yeah.. Yeah, oh, we hold the remote. Oh,

but it it does feel all cold and slimy. I hate Play-Do, it's just minging. But yeah, uh that's cool, cool. Mm-hmm. Okay. Wales. Mm. Cool, okay. Right, okay. Fabulous, yeah. Okay, cool. So what we're gonna do is prefer prepare the evaluation of the new design. Um so we're gonna be using a seven point scale, so one is, you know, yes, it totally meets with that requirement and seven is, no, it really doesn't, we need to go back and start again. Um, you know. Basically, what I did was I went through all the like user requirements and things that we've done and we've worked on and like made a list of them. Um you know, so that we can evaluate each one and like so it was about going back to the start and saying oh yeah, we did manage to do that, or oh no, we really forgot about that. Okay? Cool, so these are what they are. Oh Yes, I did have A\_, B\_, C\_, and D\_ down here, but it seems to have turned into like just bullet points. Okay. But if you can imagine that they say A\_, B\_, C\_, and D\_, then that would be really good. Well, I thought we'd um kinda said that you'd have a little thing to stick on the T\_V\_? Yeah. Cool. Okay. So, be attractive to look at. That's this one. What do you all say? Yeah. Oh we're all so proud of the. Okay, so that'll be a seven for A\_. Could oh no, you can't whilst that's up there. Okay um uh what I've done on the next page is I've set it up so we just put the marks in. Yeah. But that's alright. If you take a note of them, and then I'll put them in in a minute. Okay, so we're all agreeing on seven for A\_? Cool, okay. Does it match the operating behaviour of the user? Yeah. I mean Yeah. I th I think it's not it's not like it's a pen. Yeah, but I mean because it's not like it's a pen, you know, left-handed people can't normally write right-handed, but they can normally do most things right-handed, so I would say it's not such a big issue. Yeah. I mean you can you can use your finger to to scroll rather than your thumb. So I mean that does kind of negate the whole R\_S\_I\_ issue. So maybe we need to put that needs a little bit of investigation, maybe give it a five, I would say? What do you what do you all think? Okay. Yeah. Yeah. I th I think the alternative is flipping from the top. Yeah um But you were thinking about making it smaller, yeah? Because So you have to keep that side flat. So it works like a mobile phone flipping, but y you know, as long as that side's flat, than that will work. Okay. Um okay, so C\_. Are are we admitting defeat on C\_ or are we saying we're gonna stick a locator on the T\_V\_? There's a locator. Cool, so that means you need a that does mean you need a little speaker on it though, doesn't it? To make it beep. Or a buzzer. Okay. So that's two, so that's seven, yeah. It's locatable? Fabulous. D\_. Yeah. Yeah, and I mean d So, should we maybe say f a five and say it is intuitive, but it's different, so, do you know, I mean it's obvious how to use it, but you might have to think about it first. So we give that one a five, you think? Yep. I'm glad you're accepting this. It has taken a little while, hasn't it? Um intuitive but Sorry, it's really hard to write on those. I just went a bit mad, didn't I? Um okay, cool, E\_, okay. Um I would guess this comes back from this whole B\_ thing links in here, so possibly for left-handed. Investigate. So, should we give it a six? Six? I used to send fifty texts a day, you know, and I never got repetitive strain injury from that, so I find it quite hard to believe to be honest. Okay, so we give that a six, yeah. Okay, F\_. Hang on, how come it's showing up with the things there but it only had bullet points there? That's just Oh okay, cool. Um right, so. Yes, so that's a seven then. Um, cool. Yeah, but I mean you don't They're never been used i they've never been using remote remote control before I don't think.. Yeah, what do you all think? Six? Well, that's it, I mean Yeah, but I mean everything has been used in space before it gets to anyone else real

ly, hasn't it? So, I don't think many peop That's it, they can take it with them. So, we give it seven, and we write There we go. Cool. So, we need the average here, so we got Seven So we've got four sevens, so that's twenty eight, three sixes, eighteen. Two three four Seven eight. Okay, that's pretty good, I think. Um no, that's it, yeah. Cool, there we go.. There we go and there are the marks. Yeah. Yeah, but rubber comes coloured, doesn't it? You know. Yeah, you might end up having to take off the sample sensor.. No. We've got more than one pushbutton though, haven't we? 'Cause then you have That means you can only have twenty five push buttons in total doesn't it? Not counting anything, we'd still be in budget. Twelve point five. No. Well it doesn't, but it uh And L\_C\_ display. This sample sensor. Yeah, the sample sensor will have to go, 'cause that's the most expensive thing on there. Yeah. But that's a bit of a gimmick anyway really, isn't it? We can afford to get rid of it. So that means no locator, does it? I mean does Yeah. Yeah. Okay, yeah. See, I was gonna say the scroll wheel pushbutton thing, 'cause But that's well you would just have to to spin it down. So that's point three. Yeah, I mean that wouldn't actually cost any more. That's the spin wheel though, isn't it? Didn't that come with the L\_C\_ Yeah. Yeah. S so we're point three over. Unless we just take off the scroll wheel altogether and just have pushbuttons for the volume. Could b still put them on the side. But yeah. I mean the scroll wheel's pretty cool, but Yeah. Yeah. Yeah, well we could admit to the single curve, couldn't we? Yeah, but Yeah. Yeah. No. No, I don't think so. Yeah. We just got rid of a gimmick that was never anyway, and the scroll wheel is I mean essentially the two buttons that was it's not a great difference I don't think. Really? Cool. That's not a very exciting colour. I think you should make it more vegetable-like. Oh the the beeper thing. It Yeah, I think Jen wants it to vibrate. You know, your pen vibrates? Yeah. Cool. Yeah. If we'd had that sheet at the beginning should've been like, okay, so we can have that lot, let's just throw it together and do what we can. Yeah. I think 'cause the meetings were so regular, you know. It wasn't like we were alone for very long, so you didn't st go off and think, wouldn't it be great to have a vibrating remote control shaped like a banana, and then, you know, come back three days later and Jen's going look, look, it vibrates and it looks like a banana. Um yeah, so yeah. Uh I like the pens. I want one. That would just be so cool, to d do all your notes and s I don't think you should say that was the recording. Okay, cover up the microphone. Alright, let's take it. Okay. It is a bit limiting, isn't it? Yeah. Yeah. The thing flew in, you didn't have the whole whooshing thing, 'cause there wasn't time for that, so yeah. Not that you can do that on the board, either. We could make some little Yeah, totally, I mean that was fairly tight anyway, I mean especially with that last-minute alteration. back it, this is just had to be changed. And yeah, so cool. Are we supposed to say nice things about Jen now? Yeah, definitely. You weren't like a a dictating leader, so that was always good. I know you've got the pen, you might attack me with it. Yeah. Yeah. I don't know, I don't go shopping for remote controls that often, maybe somebody's already though of it. Yeah. Yeah. I'll be looking out next time I need to write an essay. That looks boring, I'll see if anyone's made a remote control. Yeah, yeah. I think we'd like to think the ideas were new, but we've got no way of finding out. That vibrates Yeah, but that would just come up with like other things really wouldn't it. Yes. And it's fabulous. It's in the project documents. Yeah, yeah, sometimes it's like a little bit rushed. Yeah, we've got like five minutes left. Yeah. 'Kay. We could draw animals on the board again. I don't like Play-Doh, no. It's just m

inging. It smells so bad. It does. Mm. No, it hasn't been. Do we have to go back into the other room or can we stay in here now? Okay, so the other way. I'm proud of it. Uh-huh. How how much do we have, forty minutes? Yeah. Okay, so. Presentation. Okay. Okay. So um basically going with our trend of vegetables and we selected the colour and approximate shape of banana. Um Yeah. Um Yeah. Um so basically it's the it's the flip open thing again. So now we we have the okay, so Ma Maarika will explain

you the user interface there. And it flips open on the side, so it opens like that. And we have the user interface on here and uh the the L\_C\_D\_ and and the scroll are inside. Um well, everything else is probably user interface, so. Yeah, yeah. Oh yeah. Yeah, it has, yeah. Yeah, well, but i since it's made of rubber anyway. I I think it's it's uh Yeah. Mm. Hmm. It's on the side. Uh no, we we'd not put so on on the cover we have the the bare essentials. Uh on the L\_C\_D\_ we r you know, the main menu will have various options. Mm. Mm. Yeah, it's hidden in there somewhere. Cool. We ran out of resources here, so. You can have a look. Yeah, see the budget. I guess we'll give it maximum points in everything. So? Yes. Okay. But we can we can I can I can take note uh uh Um the the only thing that we were considering was that uh this thing is kind of more for right-handed people than for left-handed people, so if you're left-handed you're kind of left uh scrolling with your finger. But then yeah. Yeah. So bu it's it's not a huge problem, because i i it is operatable. Right. Yeah. Yep. Mm. Mm. One more thing is that i It might be a little clumsy when when it opens up, right, so it opens on the side. So Yeah yeah yeah, I mean yeah. So you guys can decide wh whether Oops. Yeah, but we which makes it kind of really big, yeah. Uh this this kind of uh makes it more and two, it might interfere with the I\_R\_ channel. Okay. Right. Okay. No, we have a locator. Yeah. Yeah. Intuitive, completely intuitive. Intuitive. And uh even the scroll, it's a it's a new technology so m m might be a little more difficult for people to get used to in the beginni so it is kind of not very intuitive but uh it's a good technology, I mean once they get used to it. Yeah. So I Yeah, okay. I'm gonna give a seven in everything, so. Mm.. Yeah. Yeah, unless you are a all the time sitting. Yeah. Yeah, I I think it is ergonomic. Mm yeah. And moreover it it has um L\_C\_D\_ and everything, so that uh you know uh we minimise the pressing of the buttons anyway. Absolutely. So it has voice control. Yep. Anyway it ha yeah, it's the most sophisticated remote that I ever seen. Yeah, but they've been brought together in a remote. Yeah. Absolutely. The carrot banana remote. I think that's a. Yeah. There are how many sixes? One, two, three. Three. And one five. Okay, twenty eight, thirty eight, fo forty six. Forty six and five, fifty one. Fifty one divided by Mm I guess it'll have to wait for a bit. Mm. Advanced, yeah. Yep. Mm anything uh I think which is not more. Yeah. Mm. No uh we we have uh yeah. Mm no. We don't have we're not using any of that. Huh? Wh wh what is the limit? Uh. Mm I don't think so, no. No it says what what is the kind of interface, if it is pushbutton then you got a zero point five, it's a scroll wheel so we we've put it's pushbutton and scroll wheel and L\_C\_D\_ display, so that's that's the three kind of interfaces that we have. Wh wh what's our criteria? Uh okay. Uh it does not have for voice recognition, but it does have for the feedback speaker. when you say when you press one it says one or it says hello. Mm and the locator also goes away. A also i in the case I'm not sure that you will evaluate this as a curved surface, because it's just rubber, so it's probably a flat surface rubber. Uh I mean uh um yeah. Um So tha that mean that we cannot press how do we how do we make a selection in uh in the L\_C\_D\_? If in the L\_C\_D\_ we can scroll, right? But how do we make a sele

ction if we d cannot push the button. No w w w but ha it's it's the scroll wheel and I thought we were referring to this as a scroll spinning wheel and pushbutton thing. That comes with the L\_C\_D\_? Oh so so the the this is. So we're adding costs for right, okay uh I mean I think this is good. Instead of scrolling here we have two buttons here, up for up and down. On the side. Mm uh it sounds good actually, yeah.. We have, yeah. Not really, no. Because we keep all the features, we keep voice recognition, we keep L\_C\_D\_ display. We instead of having scrolling we we just push the buttons. Um yeah. Yeah. But we lose the locator. So instead of speaker,. 'Kay. I think it mm I think uh n one thing that was lacking uh was that we did not know what the various things cost to begin with. Um we kap kept a adding things randomly. So, had we known Yeah, that or not, yeah. Yeah. So d all the random decisions at the end

could have been prevented. Mm. Yeah, mm. Yeah yeah yeah, that's it's it's I wonder what one of these costs. Yeah. Mm yeah. Yeah. Yeah. Mm. I guess it was a fairly small group, so all of us got to express our opinions, yeah. Mm. Hmm. Yeah. Mm-hmm. I thought that was good though, because if you're given too much time then you got nothing to do with your time and um yeah. Although we could have made the R\_s better had we had five more minute. We certainly are, mm. Yeah. Yeah, same here. Mm uh no. I don't think so. Was there a questionnaire already sent? Okay. This is our final meeting, the detailed design meeting. And again I'll take minutes. The what we have to get through in this meeting is firstly the prototype presentation from you two, so you can show us what you've been working on so diligently. Um then then Cat's going to present the evaluation criteria that we're going to be evaluating this against. Then I need to say some st a few things about finance, 'cause we have to check that it's within the finance criteria. Um and then we'll be making sure that our product fits both the evaluation criteria from Cat and the financial limits. Um and then we uh will have a brief evaluation of the whole process of production and design that we've been through. So we've got forty minutes. S 'Cause we missed out. So it's now I guess that we're supposed to start at fifteen thirty five, so we've got until four fifteen. Is that right? Yeah, until about four fifteen. So yeah. Go for it. Do you want Yes. Dual use, perfect. Dual use, perfect. Does it vibrate when you press the buttons? Sorry, sorry. Mm-hmm. Mm-hmm. Wow. And it's the whole thing's made of rubber, is that Mm-hmm. Yeah. Huh. Mm-hmm. Yeah. Six seven eight nine. I like that. Yeah. Uh-huh. Yeah. Mm-hmm. Yeah. Mm-hmm. Mm-hmm. Y or you could have it so you on the wheel if you. But if you hold it in, if it's a scroll and click so you hold it in? no. Mm-hmm, very good. And it's with the the black and yellow you're even in the right colours. Mm-hmm. Very good, let's have a look. Test it out. Uh it's a sort of intermediate colour, I guess. Very good. Okay, so maybe if we go on to evaluation cri criteria and then we'll there I suspect we're gonna have a couple of minor finance issues, but um we'll se I'm sure we can get around them somehow. We'll just send all of our manufacturing to some nice poor country and cut some of the prices that way. Wales, for example. Marketing Expert. Mm-hmm. Mm-hmm. So for each of these we need to give it a one to seven. Is that right? Mm dots, never mind. Yeah, I agree. Yeah, just prepare one now. I reckon it Yeah. Seven, yeah, it's terribly sexy. Yeah. Ah, okay. Excellent. Except we can't uh we can if we then yeah, I'll take a note, it's fine. Yeah. I think it does. Alright. But that's gonna be a problem, 'cause you don't always have all left-handers or all right-handers in a family. Yeah. Yeah. Mm-hmm. Yeah. Mm-hmm. Yeah. Um Six. Yeah, I think I think for um I mean most people are right-handed, so in in terms of our greatest target group, I think it's pre

tty good, but we might want to flag it for management, they want might want to um They Mm-hmm. Yeah. The length is gonna be difficu Mm. No, we're gonna put it like we've got th there's the locator dot. Mm. Yeah. Yeah. I'd say six, 'cause the I mean the the standard layout for numbers is three three three and one, rather than the way you've got it. I really like the way you have it, but it's not the immediate thing that you're used to. So Might be But it and it's something that they will be experiencing in a lot of different places soon. Five? Yeah. I'm happy with five? Yeah. Yep. But otherwise it's superb. Six. Yeah. Well we've banned them from Yeah. Yeah, it's varied. Yeah. Six? Voice control have seven. Ah, that's the second one. So you must have changed it on this one where it's got score, but not on the previous slide. G\_ technologically innovative. But in terms of the actual technology, none of it is actually new. Yeah. All of the components have been used in other things before. But do yeah, yeah. Yeah. What do you reckon, five, six? Yeah. Space remote. Put fashion in electronics. Very good. Yeah, one. Or a seven. Fifty one, one, two, three, four, five, six, seven, eight. Six point point about six point five. Close enough. Now wait until we get to finance and then we'll see if we can afford it. That's all you've got at

the moment, or did you have anything more? That's it? Alright. So, finance. And we'll see if we can unscrew this first. Sorry, this is I'm just um Beautiful. Not anymore. Computer no signal? Adjusting. There we go. Okay, so we've looked at the prototype presentation and the evaluation criteria. And now we have to calculate the production costs. So I've got an Excel spreadsheet to help us do that. Can you read that? Almost. More or less. Um I started filling it in, but of course these are provisional, so we have to go down. No hand dynamo, right? One simple battery. No kinetic energy, no solar. The chip, we're going for an advanced chip on print. We also said the sample sensor and sample speaker. Um single-curved surface, so that we can fold it. Case material we said rubber. I don't know what special colour means. It could be Rub rubber comes coloured, it's I would maybe it's like if you want titanium coloured or wood coloured, it's different. Yeah, let's leave it as zero, 'cause it's easy. We we're definitely going to have to so we've got pushbutton, and then we've Scroll wheel with pushbutton we had, no? S for the muting. Yeah. And button supplements. No. No? But the the spinning wheel's not there. I have think maybe it's integrated with the L\_C\_ display? I think the pushbutton oh. I don't know if that's one Yeah. That seems unlikely. Push what uh whether whether pushbutton means that p count by button or do we I don't think that makes sense. No. Yeah. Yeah. Yeah. Yeah. So, as we can see, that's way too expensive down here. Our budget's twelve point five. Yeah, so that has implications though for the. For the locator. Yeah. Yeah. What else does it need? Yeah, 'cause the sample speaker was, I think, more complicated then just a beeping thing. Yeah, okay, so we Uh-huh. Right, so we need one fifty off. Take it down to just a scroll wheel. We could do Yeah. You can have to scroll it straight r roll it straight down for for mute. That's with the L\_C\_ We decided, 'cause it's not on our list. The scroll wheel is on the side. We're point three over at the moment. It's nothing n Yeah, I have Yeah. Rather than having three different things that people have to do. There we go. Oh look, we're way under budget and we'll make huge profits and we'll all get bonuses. Or or that we have to have some sort of special colour. So that's alright. We we'll leave it at that and then I'll take I can send it back to management and say we weren't quite sure about the colour, if that costs extra then we've still got some space for it, yeah. Excellent. Alright. So did we lose um on our evaluation criteria, as a result of doing that?

Mm. Yeah. Yeah. Yeah. Alright then. We're gonna have a beep. Yeah. Yeah. Tha. 'Cause we we won't have run out of our pot of Play-Doh. Yeah, I know I know, my pen vibrates. But only for a very short time. Um okay. So looks like we've designed a banana. Well done, team. Um we need we've just got about ten minutes or so left of the meeting, so it would be good if we could just have a little talk about the project itself and how it went, um so that we can feed back to the management for next time they're designing a product. Feedback? Ideas? Mm-hmm. Mm-hmm. Yeah. Mm-hmm. But in terms of the process of um going and working individually and then coming back to a meeting, that that worked in terms of. Mm-hmm. Mm-hmm. Banana. Mm-hmm, the whiteboard digital pens. We like the pens. Yeah, you could take it to lectures and just write stuff down and have it printed out when you got back to the office. They great? Do you think they'd notice if one went? Oh okay. Yep. Shh. Yep. But that worked well having having a whiteboard that we could draw on as well as having the PowerPoint, 'cause the I find that the problem with PowerPoint often is that it's so static and you can't change it once you're in there, yep. Mm-hmm. Yeah. That's alright, that always irritates me anyway, yeah. Mm. Yeah. Yeah. And presumably you don't you can say nasty things as well. I have no stake in it. You have to say that, 'cause I'm taking the notes. I'll leave the room and you can have another go. Better than that than the banana. I think it worked quite well. Did anyone feel that they were getting sort of covered up and not being able to say their bit? Yeah.. New ideas found. Not quite sure what about. Yeah. Yeah. Mm-hmm. Yeah, that's right. Banana remote. Yeah. Or you can always go to Google and type in banana remote

control. Flip. Vibrate. And uh yeah. Nothing that you really want. True. Yeah. Okay. So, costs are within budget, well within budget, including a little what have we got? One Euro left over for bits that we didn't foresee. Um we've evaluated the project. You've got the scores. Can you put that in the project documents file? It's in there already. And the process wheel didn't really have any major problems with. Were there any was there anything that you found difficult, or anything that didn't go as smoothly as you'd hope? Yeah. Okay then. Um I think we're still well within our time. We've got about five minutes left, but if we've finished, then we've finished. We're just too too efficient and you should never drag a meeting on just because you have extra time. So I would say that's the end of that meeting. Thank you, team. It was very productive day and Mm uh no. Right, so we have to complete the final questionnaire and meeting summary when they send it. I don't know if it's already sent or not. Um presumably I have to I don't see why you can't stay here, really. Did I save this one? Production costs. It was supposed to be pink. But it was blue on the board.

## Executive Summary

um we decided to use a kinetic charger , standard chip , um 'cause it can come in various different sizes , We wanted a stand-by function . The case material is gonna be soft , rubbery , changeable . Um buttons with a combination of L\_C\_D\_ and rubber according to the design . Um bright funky designs inspired by fruit , keeping with the hip kind of feel . Um and to try and incorporate voice recognition software into our design until we can find out more about the cost of things like that . Prototype presentation . Um and the rubber buttons that we'll use will be anti-R\_S\_I\_ . Me and William worked on a prototype , and I think William is going to make a p presentation on that . I can hold it like and I'll I'll show you the presentation . And we'll first look at the exterior of what we've uh come up with over there . Um It's gonna have a a plastic body um with a sort of standard colour , either we're thinking some something fairly neutral like a a white or a light blue or something . This is underneath the rubberised the rubberised uh outer casing um which there'd be sort of a wide choice Um the um wide choice of colours and sort of patterns , Um it's obviously an a sort of clam-shell design and uh the um the top L\_C\_D\_ screen that you can see that would b would be sort of um how do you say , it's yeah yeah , it would be sort of inset into the into the top The black and white touch screen and the buttons at the bottom would d so so it'll fully close flat . we've um already said d decided on the kinetic batteries , which actually , thinking about it now , could y could also probably attach to the flipping open and shut as well , So put it in the top section rather than the bottom sections , Um we decided that um the voice recognition system , it did actually say on the email that they were sort of coming in and they were fairly easy to get a-hold of , so we presumed that they'd also be quite cheap . So you'd have something like where you'd shout out , where where is the remote and it'll shout back , I'm here , or something . Um the standard , there's be a standard transmission with the T\_V\_ using using all the standard chips that we've talked about . obviously 'cause it's split over two two different layers , it would need two separate P\_C\_B\_s , so it would be joined at the hinge through some sort of cabling . And uh because , obviously , all T\_V\_s use this , the same infrared medium , we'd just be using using the same thing to transmit the data . And the infrared um sender would be on the on one of the bot the bottom layer , just at the front of the So when you've actually got it open , it would be facing the T\_V\_ . And then finally um on to the interface . The top screen , as we said , is would be an inset um black and white L\_C\_D\_ s touch screen which yeah would uh have all of all of the the available functions for for the remote on it , uh whereas the bot the bottom screen would just

contain the standard buttons , like the vo volume up and down , channel up and down , power on and off , and uh things to that effect . And now we've we also decided on the inside , we could possibly either have um some some kind of sort of bezzled uh logo on it , or something inset , or maybe an engraving of the logo on the top . But not interfering with the outside kind of look of the product And finally that's how we put the fashion back into electronics , as that is that's the company logo . Um I've now got evaluation criteria . This stage of the evaluation is really for us as a team to evaluate if we have now got a product specification and prototype design that meets the the criteria that we got from our market research . the collection of the criteria , as we saw in our previous meeting , was based on the user requirements and trends found in the marketing reports and marketing strategy of our company . are we actually meeting those trends and requirements ? So it's what we've discussed in the last meeting , The criteria that we want in this remote control are a fancy look and feel , technological innovation , it should be easy to use , it should incorporate current fashion trends , and those the two main ones , they were the spongy texture and the fruit and vegetable strong design colours . The design should minimise R\_S\_I\_ and be easy to locate and we were still um uh slightly ambivalent as to whether to use voice recognition there , though that did seem to be the favoured strategy , We're going to use a seven point scale , where one is true and seven is false . and I will just do a preliminary rating of all those criteria on the whiteboard here . Is it everybody is going to evaluate , or just the Market w we'll discuss each one and we'll come to a consensus rating between one and seven . I won't write all of that out again . It will just be criteria one , two , three , four , five , six , Actually , it might be an idea , if we each did give our own individual rating , and we could take an average at the end . So I'll just separate the ratings by obliques , and if we go one , two , three , four , we know who's who . Criteria A\_ , the fancy look and feel . My own rating for that would be a two . Two and three quarters ? criteria B\_ , criterion B\_ , technologically innovative . I would give that a three . I'd give it a one . It's just two point five for that one . ease of use . Based on what you've said there , I would say a one , true . I would say a two . I would say a two . One point seven f five . it incorporates current fashion trends , I'm just thinking , before I give it my rating , you were limited in the use of materials for your prototype here . Is this actually going to be the colours that you would use ? the the base colour was um white or or like or I sort of a light blue , but the changeable fa faces would uh allow you to get any basically any one of a number of colours that uh th it's full sort of customised . So we could use any strong fruit and veg colours and that's what we're intending to do . 'cause th that's that's the the spongy feel would be in the rubber that you put round it , In that case it's got to be a one for me . Yeah , I'll give it a one as well . to does the design minimise repetitive strain injury . I don't think we've really touched on that a lot . we haven't really come up with anything that we felt could feasibly reduce that . but the very use of a remote control , if you're someone who's zapping , who's sitting like that , and we found so many people did , how do you minimise that on such a small device ? the type of button that we're gonna use in the bottom half , the material , minimises R\_S\_I\_ but with the amount of stuff we're putting on it isn't that much . I think I'm gonna have to be neutral on that and give it a four . I'd uh I'd f I'd go for a five , actually , And finally , last but not least , easy to locate . Now we talked about voice recognition , we talked about a beeper , Yeah , it was it was uh a voice voice recognition , have the designers come to any dec real decision on that ? And are we happy with the costs on that ? That is going to be feasible , cost-wise . Yeah , yeah , that yeah , that's feasible . And if you didn't hear it in the room that you were standing in , then

you'd realise that it wasn't in that room , you'd go into another room . it would be quite loud . That's a one for me . I do realise that we might be being fairly biased , 'cause it is our product , We've got our our we've got the highest rating of meeting the specifications that is definitely true for two of the uh six criteria there . That is for um incorporates current fashion trends and is easy to locate . The lowest rating we've got , which is really n it's not terribly low , i it's close around neutral is for uh the minimisation of repetitive strain injury . Do we feel on the basis of tha of these evaluation findings that we can go ahead and now produce this as a prototype and market it , or do we have to make further modifications ? I don't think so . We happy to go ahead ? I think we yeah . I think we're set . I think for most of those ratings that it's high enough at the upper end of the scale for us to go ahead with that , I'll just leave it there . I've got finance here now . We just type numbers into this and we come out with the final value . So are we still on for kinetic ? Yeah . See , it woulda been handy to have this at the beginning . Um it might have influenced our choice . It was a regular chip on print you you've put in three for the number of kinetic cells , there should just be one . one of them and one sample sensor and sample speaker . One double curve . 'cause it's two . what's a single curve then ? It would just be a flat bottom with one curve . like a domed thing . Um we've got plastic and rubber , I think rubber , since it's being used just as a casing , See , it says case material . we're not actually using plastic in the case , There's nowhere else we can code for the the rubber used in the casing . So do we not have to account for it in the cost somewhere there ? Or sh we should just put it in as one , because the plastic is zero anyway . special colour , do we need that ? Might do , if we go for some of the more exotic aubergines and such like colours . the push-button's one and L\_C\_ display one . I think we could change the battery also . Instead of going for kinetic how about going for a standard battery . and I really doubt if on the basis of current technology and our current capabilities , we could actually do much more to minimise that . and just actually making the rubber case the curved thing , is that going to make a difference ? so the highest we've got is the electronics here . Um and the interface . If we moved away from our much loved idea of a kinetic battery and just went with the standard batteries , would that make a huge difference ? it um it would make one difference . What I feel is , customers never said anything about the battery . but if you take away the voice recognition , then you've got it . If you took away that , that'll make it twelve point three five . If we change it to the battery it's that's minus three . We could do the voice recognition for , you know , business class or something , you know , like an upgraded version . I don't see why we have to sell it for twenty five Euros now , because they w they were saying they were quite willing to pay more for better product . We can put in our recommendations . If we if we're working to head office specifications as this is what this project team's working for , we can put in our recommendations for what we've we've found and what we the consensus that we've come to as a result of the meetings . Um as you say , we can offer the voice recognition initially to business class customers So if we take voice recognition out That'll do it . Twelve point three five . Is it twelve point fif was it twelve point fifty ? we are close to the budget . So we are under the budget . Product evaluation . We've done room for creativity , Because we've got decisions that we would have made that we weren't didn't feel able to make . Um I presume we discussed leadership and teamwork . Although we had our separate tasks , I think we had a nice time . there was so much interaction , so much that we needed to um bounce off each other . in that in relevant areas we've been able to , you know , give and take and adjust our remit where necessary . Yeah , I think there was uh very constructive feedback

by everybody . We came to a very predic creative design , yeah . And Sarah , you coordinated the work very well . I think it would have made it into the final product if it was actually if if we'd seen the marketing before the initial specification was put out , I think maybe it would've come out a d little different , although we didn't quite make the voice recognition in there , but that's that's good . I liked the fact that we could say an idea and it'd be suggested that that wasn't the best idea , but no one felt like shot down , you two created that wonderful specimen of a Play-Doh model . Um means , whiteboard , digital pens , etcetera , what does that mean ? Any ideas ? How do we evaluate the materials we had for communicating and sharing information ? Could it've been better , I think I think we probably woulda used the outer email system more , had we actually had had more time and if we'd been separated more . I think it's new ideas in general , It's really borrowing from other areas , it's , you know , bringing things from other areas in , Surprising to me is like uh people give a lot of attention to modifying mobile phones , like a real want to see a new launch or something like that . but nobody giving uh much idea to this . I think it's really good that this has been very market research based , because just going back to mobile phones , I mean this is the first change in remote control devices that I can really , you know , say is is obvious and visible . We see it in mobile phones a lot , and tha that's where we've borrowed a lot of our ide our ideas from . There are innovations in that that people don't really want . and I think it's wonderful our company's so R\_ and D\_ based . Um our costs are below budget with recommendations that they the budget be increased , Do you think that's takes into account um overheads like us being well paid kind of a thing ? And the heating for the building , do you think our budget includes everything , all the costs that are going out ? I think it was just the produc uh just the production cost of the phone . I think we've done very well to get within budget Um and we've got the meeting survey and questionnaire . There's a final questionnaire . we've got about fifty minutes to catch up with everything that I fell behind with , I think I've got minutes for two of the meeting and the last thingy .

## Complete Meeting Transcript

Is that someone's? Okay. Or something. Well done. Certainly. Logged in? Thank you. Oops. Okay. This stage of the evaluation is really for us as a team to evaluate if we have now got a product specification and prototype design that meets the the criteria that we got from our market research. So this is the first stage of the evaluation. Now, the collection of the criteria, as we saw in our previous meeting, was based on the user requirements and trends found in the marketing reports and marketing strategy of our company. So it's what we've discussed in the last meeting, are we actually meeting those trends and requirements? Now the findings that we came up with, just a recap, are here. The criteria that we want in this remote control are a fancy look and feel, technological innovation, it should be easy to use, it should incorporate current fashion trends, and those the two main ones, they were the spongy texture and the fruit and vegetable strong design colours. The design should minimise R\_S\_I\_ and be easy to locate and we were still um uh slightly ambivalent as to whether to use voice recognition there, though that did seem to be the favoured strategy, but there was also, on the sideline, the thought of maybe having a beeper function. Okay, so we can come back to that slide, if you don't have a note of those. I'll

just show you how we're going to evaluate our own feedback to this, to what we have so far. We're going to use a seven point scale, where one is true and seven is false. We look at each of those criteria that I've just mentioned, I'll call that slide back up, and I will just do a preliminary rating of all those criteria on the whiteboard here. Does that seem clear? Any questions there? So we're going to look at these criteria. Yes, we're going to come to where we'll discuss each one and we'll come to a consensus rating between one and seven. Is that okay? One is true, seven is false. Right. So I won't write all of that out again. It will just be criteria one, two, three, four, five, six, or A\_, B\_, C\_, D\_, E\_, F\_ to confuse it with the number rating. B\_, C\_, D\_, E\_, F\_. This is where I realise how tiny I actually am. Criteria and rating. Actually, it might be an idea, if we each did give our own individual rating, and we could take an average at the end. How about that? Okay. So I'll just separate the ratings by obliques, and if we go one, two, three, four, we know who's who. Okay. Criteria A\_, the fancy look and feel. How do we feel about this prototype model relating to fancy it is a fancy look and feel. One is true, seven is false. My own rating for that would be a two. One is true and seven is false. I'll just go this way. Two. Okay. Two. A four, okay. Adding those up, we've got a six and a five, eleven divided by four is what? Uh two and three quarters, is that right. Two and three quarters? Okay. Two point seven five, there we go. Okay, criteria B\_, criterion B\_, technologically innovative. I would give that a three. Okay. Not that you're biased in that it's the designer. The average oh, for you? You want your rating to be a two? Is that what you're saying? Okay. So, I'll work out the average for that again at the end. It's a very slightly altered. Okay, and we're just waiting for your rating. Two point five, okay. Losing one decimal place, that's okay. So what are you rating for this one, Paw? Two, okay. So that is eight. That brings it down to two, nice and simple, yeah. Okay, ease of use. Easy to use? Based on what you've said there, I would say a one, true. Two. A two, okay. Two. I should've said a two to make the arithmetic easy, shouldn't I? We'll just put almost two, because I'm not gonna get into silly decimal places. Okay. Or we or if we want to really bring it down, we can do later. Um mm now we're looking at it incorporates current fashion trends, now that's particularly in relation to our market research findings about the spongy texture to the exterior and the fruit and vegetable design colours. Right. So

I'm just thinking, before I give it my rating, you were limited in the use of materials for your prototype here. Is this actually going to be the colours that you would use? Right. So we could use any strong fruit and veg colours and that's what we're intending to do. Okay. And the spongy feel is no problem with that. Okay. In that case it's got to be a one for me. Yep. Everybody? Okay. That part was nice and easy. Okay. Uh moving on to does the design minimise repetitive strain injury. I don't think we've really touched on that a lot. We've we've discussed it, we haven't really come up with anything that we felt could feasibly reduce that. We've talked about pointers, but the very use of a remote control, if you're someone who's zapping, who's sitting like that, and we found so many people did, how do you minimise that on such a small device? Mm-hmm. Mm-hmm. Mm. Mm-hmm. Right. Right. I think I'm gonna have to be neutral on that and give it a four. A five, okay. Four and a four okay. Twenty one is that twenty one? So that's four point two five. And finally, last but not least, easy to locate. Now we talked about voice recognition, we talked about a beeper, have we really have the designers come to any real decision on that? It was the I'm here thing, yep. And are we happy with the costs on that? That is going to be feasible, cost-wise. That sounds good then. I'd go for a I ca we can adjust the volume on that, just as we could volume on T\_V\_. So if somebody's in the other room or if T\_V\_s in different rooms, or. Right. Okay. You built into the feature. Okay. Logical. That's a one for me. One and one, good. So, how do we feel about this? We've got our our we've got the highest rating of meeting the specifications that is definitely true for two of the uh six criteria there. That is for um incorporates current fashion trends

and is easy to locate. The lowest rating we've got, which is really n it's not terribly low, i it's close around neutral is for uh the minimisation of repetitive strain injury. Do we feel on the basis of tha of these evaluation findings that we can go ahead and now produce this as a prototype and market it, or do we have to make further modifications? We happy to go ahead? Yeah. I think for most of those ratings that it's high enough at the upper end of the scale for us to go ahead with that, and I really doubt if on the basis of current technology and our current capabilities, we could actually do much more to minimise that. I know. Okay. Well, I hope that's uh clear to the team. Is there anything you would like to to ask me about the findings before I sum up? Good. Fine then. I'll just leave it there. Oops. Oh yes. Yes. But it has a slightly flattened bottom so it can sit. So it can rest. It would just be a flat bottom with one curve. like a domed thing. Mm. The other curves at the sides, but it's slightly flattened at the bottom so it doesn't roll over. Yeah. What does it mean if you put point five for that? Mm-hmm. Right, okay. But it is gonna be part of the total cost, and there's nowhere else we can we can put that in, is there? There's nowhere else we can code for the the rubber used in the casing. So do we not have to account for it in the cost somewhere there? Okay. Mm. Might do, if we go for some of the more exotic aubergines and such like colours. S Has that not made any d if you click off that square now, has that not made any difference? Is it oh, it's brought it slightly down. So is is uncurved completely and just actually making the rubber case the curved thing, is that going to make a difference? Oh, it's not made any difference, has it?. It's gone up again. Oh. It's brought it down slightly. Is there anything on the menu No. If we tr um. If we moved away from our much loved idea of a kinetic battery and just went with the standard batteries, would that make a huge difference? And people are used to buying batteries, they're not gonna say I'm not getting this, 'cause I've got to buy a batte

ry for a remote control. Should we see what difference it makes? Um Yeah. Sure. But we're still working to um head o We can put in our recommendations. If we if we're working to head office specifications as this is what this project team's working for, we can put in our recommendations for what we've we've found and what we the consensus that we've come to as a result of the meetings. But we need to work to that specification to start with. And I think the voice recognition sounds wonderful, but our object is so distinctive that that in itself is gonna make it easier to locate as a f you know in a first instance. Um as you say, we can offer the voice recognition initially to business class customers and so Mm. Yeah. 'Cause we've done all the background work to go for that if they want it. Yeah. So if we take voice recognition out we are. Are you sure? Sorry, not meaning to doubt your words there. Right. Are they really going to quibble about ten P\_? Or point zero one of a Euro? Which is less than ten P\_. That's today's kick off meeting,. Mm. I thought that's what it was. So we're okay. Although we had our separate tasks, there was so much interaction, so much that we needed to um bounce off each other. And I've certainly felt heard, listened to in that in relevant areas we've been able to, you know, give and take and adjust our remit where necessary. Yeah. Maybe we should think of branching out into children's toys and fake mobile phones as a side line. And fake R\_C\_s. How do we evaluate the materials we had for communicating and sharing information? Could it've been better, was it adequate? Mm. Yeah. Yeah. It's really borrowing from other areas, it's, you know, bringing things from other areas in, it so it's I mean nothing is new, but it's applying it to a d in a different area. Absolutely, yeah. Mm-hmm. Mm-hmm. Yeah. Yeah. Yeah, the focus isn't on to that, yeah. I think it's really good that this has been very market research based, because just going back to mobile phones, I mean this is the first change in remote control devices that I can really, you know, say is is obvious and visible. We see it in mobile phones a lot, and tha that's where we've borrowed a lot of our ide our ideas from. There are innovations in that that people don't really want. I see people wanting a model of the phone they were

really happy with, and they can't get it anymore and it's innovation for innovation's sake, and I think it's wonderful our company's so R\_ and D\_ based. Yeah. But forcing it onto people, yeah. It's things that, you know, they might want to buy the thing they really want. Mm. Mm. Or there isn't a cover to fit it or whatever, yeah. See I think I think it was just the produc uh just the production cost of the phone. Mm-hmm. But I think in the remit that we were given, it was very specific. I think we've done what we were required to do, and I think there'll have to be another project team or a new project for us to look at at those kind of things. I don't think that's something we have to look at and find a way of raising the cash for. I think we've done very well to get within budget and it still makes such an innovative item that I think people are really gonna want. I know. Maybe it will. Maybe they are gonna steal our ideas and sell it. Mm-hmm. Questionnaire. Questionnaire done. Oh, I didn't have to rate you on how much you influenced the meeting this time. Oh, right. But do we not sometimes evaluate in these meetings too? Yeah. Is that for us? Okay. Yeah, shall I show? I'll show. Though do you do you wanna do you wanna sh do you wanna hold it and I'll I'll show you the presentation. Can I just nick your Whoa. Going a bit crazy over here. Thank you. Okay, so this is our look and feel presentation, the final our final presentation. And we'll first look at the exterior of what we've uh come up with over there. Um It's gonna have a a plastic body um with a sort of standard colour, either we're thinking some something fairly neut ral like a a white or a light blue or something. This is underneath the rubberised the rubberised uh outer casing um which there'd be sort of a wide choice they would be attached, but we can we can come up with that. Um the um wide choice of colours and sort of patterns, so you've got you've got a lot of customisation with it. Um it's obviously an a sort of clam-shell design and uh the um the top L\_C\_D\_ screen that you can see that would b would be sort of um how do you say, it's yeah yeah, it would be sort of inset into the into the top and the buttons at the bottom would d so so it'll fully close flat. Yeah, yeah. And working on the inside we've um already said d decided on the kinetic batteries, which actually, thinking about it now, could y could also probably attach to the flipping open and shut as well, so that you could probably get a bit of Yeah. Yeah. Um we decided that um the voice recognition system, it did actually say on the email that they were sort of coming in and they were fairly easy to get a-hold of, so we presumed that they'd also be quite cheap. So you'd have something like where you'd shout out, where where is the remote and it'll shout back, I'm here, or something. And then yeah. It wo it won't shout out I'm here or something. It'll just shout out I'm here, or something to similar effect. Uh yeah, if it was going like I d well tha that could be something for next time, maybe. You can have a remote that tells you exactly where it is. Um the standard, there's be a standard transmission with the T\_V\_ using using all the standard chips that we've talked about. Um it would it would have obviously 'cause it's split over two two different layers, it would need two separate P\_C\_B\_s, so it would be joined at the hinge through some sort of cabling. And uh because, obviously, all T\_V\_s use this, the same infrared medium, we'd just be using using the same thing to transmit the data. And the infrared um sender would be on the on one of the bot the bottom layer, just at the front of the we haven't I don't think we actually put it on. Yeah, yeah, something like that. Yeah, on the front on the front side of that, yeah. So when you've actually got it open, it would be facing the T\_V\_. And then finally um on to the interface. The top screen, as we said, is would be an inset um black and white L\_C\_D\_ s touch screen which yeah would uh have all of all of the the available functions for for the remote on it, uh whereas the bot the bottom screen would just contain the standard buttons, like the vo volume up and down, channel up and down, power on and off, and uh things to that effect. And now we've we also decided on the inside, we could possibly either have um some some kind of sort of bezzled uh logo on it, or something inset, or maybe an engraving of the logo on the top. No d not not actually. No, not uh

interfering with the whole look of the product when it's uh on the thing. And finally that's how we put the fashion back into electronics, as that is that's the company logo. There you go.. Yeah. Yeah, okay. Yeah. Yeah, I'd uh yeah I'd probably put it uh two yeah, two or three. No, three. Three. Mm yeah. Yeah, yeah. I'd give it a one. No, no, not at all. Yeah. Two. Two. Yeah. D\_. One. Yeah. Yeah, that's No, no, the the base colour was um white or or like or I sort of a light blue, but the changeable faces would uh allow you to get any basically any one of a number of colours that uh th it's full sort of customised. Yeah, yeah, yeah and No, no, 'cause th that's that's the the spongy feel would be in the rubber that you put round it, that otherwise it's just sort of hard plastic. Yeah, I'll give it a one as well. Yeah. Mm. No. Yeah. It's meant to be. Yeah. Yeah, I'd uh I'd f I'd go for a five, actually, 'cause Yep. Yeah. Yeah, it was it was uh a voice voice recognition, yeah. Yeah, yeah, that yeah, that's feasible. Um I think it would r I think it would probably be a a stand it would be a stand it would be quite lou

d. So it would be s p yeah. Yeah. Yeah, one. I do realise that we might be being fairly biased, 'cause it is our product, but W I thin yeah, I think yeah. Mm. No. Yeah. It was a regular chip on print and Oh, no, no, no, the um Yeah, it's you you've put in three for the number of kinetic cells, there should just be one. In the top, it's the number of c yeah. Yeah, and yeah, just a no, one reg v uh Yeah, one of them and one sample sensor and sample speaker. And they're double curved. No. Y Two, 'cause it's two. Yeah, I'd say I'd say it was w yeah, I think I think it's One double-curved. And one no, 'cause one yeah, one's double-curved, and then the other one's a plastic. Yeah. And special colour. Yeah. Yeah. No, no, that's it's as an extra. So that shouldn't that shouldn't be actually on there, because that's not incorporated in the cost of the remote you get. Yeah, okay. Yeah, the push-button's one and L\_C\_ display one. And buttons Well yes. Yeah. No, we'll have No, no, you've got to click off to calculate it again. C it might uh you might you might be assuming that that is in Euros. It could be in Dollars. And then it would be fine, because the exchange range would make it about twelve. No. Yeah, the standard, it um it would make one difference. The biggest one would be taking away if you took away If you to Yeah. If if you take away the voice, I I do I don't like to say it, but if you take away the voice recognition, then you've got it. Yeah i yeah. No 'cause it's samples sens sample speaker. If you took away that, that'll make it twelve point three five. They n n yeah, but you p minus three plus two. Yeah. But they but I mean in I don't see why we have to sell it for twenty five Euros now, because they w they were saying they were quite willing to pay more for better product. Yeah. We c we could s Yeah, we could say Yeah, I s And then say we recommend Yeah. Yeah. That'll do it. Twelve point three five. Is it twelve point fif was it twelve point fifty? Ah. Okay. Yeah. No. 'Cause that that was just a bought-on extra, you could just take that out and that would be fine, yeah. Yeah, I think that's brilliant. Yeah. Yes. Yeah, I'd say, as a team. Yeah. Find out from each other, yeah. Yeah. Yeah, no, I thought it it went really well and I yeah, I I feel that everyone was listened to and all the points that were raised seem to have been sorted out, although we didn't quite make the voice recognition in there, but that's that's good. I think it would have made it into the final product if it was actually if if we'd seen the marketing before the initial specification was put out, I think maybe it would've come out a d little different, but yeah. Yeah. Mm. Yeah, well. Discuss which ones yeah. Yeah. Yeah, I think I think we probably woulda used the outer email system more, had we actually had had more time and if we'd been separated more. Yeah. Yeah. Yeah. Yeah. Vegetables. Yeah. No. Yeah, I do I don't think the the companies are really concerned. They're just like we've got a D\_V\_D\_ player, does anyone remember the remote control? Can't you get the one that we used for the last one? Yeah, just jazz it up a bit. Uh d they don't really think about it, because normally, the remote control isn't the product which they're trying to ship. They're trying to ship the D\_V\_D\_ player, the video player, the T\_V\_. Yeah. Yeah. No. Yeah. Yeah. Yeah. Mm. Yeah. Yeah. Well. I think

that was just the the physical. Yeah. Yeah. Yeah, I think yeah I don't from the market research. No. Yeah, it was I it's top secret. Um it's it is it's a conspiracy going on here. That's what it is. In your yeah. Okay. Is that it then? Awesome. Was that not the questionnaire for the how you felt you'd done in your thing? I don't think. Yeah, the the s yeah. I think yeah, questionnaire seven was the one I did just before the meeting. Mm. Hmm. Thank you. Hmm. Hmm. Yep, me too. Mm-hmm. Yep. Me and William worked on a prototype, and I think William is going to make a p present

ation on that. Yeah. I can hold it like Yeah, so It looks crazy. Um not now. Oh. Yeah. Oh, where are the hinges? 'Kay. You able to look? Yep.. The black and white touch screen wherein people can Right. Mm-hmm. 'Kay. Ah oka Infrared could be here also. Yeah, here.. So when it's even if it's open here, the signals would go. Yeah. This one right here.. Which is No. Look up to it. Yay. So this is the one. Sorry. Evaluation.. Mm um I I think this is chip. Mm-hmm. Mm-hmm. Ah, it's perfect. Is it everybody is going to evaluate, or just the Market okay. 'Kay. Yeah, so you can 'Kay. I would say four. Mm-hmm. Almost three. I think yeah. Oh sorry, I I got it wrong. The first one rating, I'm sorry. Can you just make it two? The first. Yeah, I I just it the other way. Uh in Yep, I just got two point f One is a, seven is false, okay. Two. Two. White. With for the plastic? Uh blue. Any Right. Mm-hmm. Yeah, because you'll be having a Because of the rubber case. One. Mm. Four. Voice r recognition. Hmm. You want me to b unplug that? That's all. Yes. Okay. Chip on print. Okay. Yep. Single-curved. Two curves, yeah. Single-cu. Plastic and rubber. Yeah. Plastic one and maybe rubber point five. No I think rubber, since it's being used just as a casing, we can put point five. Yeah, because there are I think it allows the point five, yeah. We can use that. It means we are not using a lot of rubber actually. We're using just a very low quantity of rubber compared to plastic. Push-button. One. An One. I think we could change the battery also. Instead of going for kinetic how about going for a standard battery. Uncurved, flat. No, it just surprises one.. I don't think so. Ri I think it's in Euro. And going to a regular bat Yeah. What I feel is, customers never said anything about the battery. It's internal, nobody looks into the battery. But shape and colours, that's something we shouldn't comprimi Where's that special form? Mm mm mm. Mm-hmm. Make it costly. Yeah we are close to the budget. Two five. It's twelve point five maybe, then. I don't know what it said fifty percent of the cost. So half of the price would be I think it is the first one. So we are under the budget. Seems fine. Except voice recognition, everything is Yeah. Mm-hmm. Yeah. I think we had a nice time. Yeah, I think there was uh very constructive feedback by everybody. It's not like people trying to cut each other. There is more of uh true cohesive teamwork. We came to a very predic creative design, yeah. Yeah, and uh Yeah, I think. And Sarah, you coordinated the work very well. Yeah. I think that was the best part of the 'Kay. Yeah, moving around the room. But I think it's good, like uh we spent times individually. I never thought of a remote control with a flip top. That's mine. Yeah, it's The thing is Yep, sorry, go on Sarah. Surprising to me is like uh people give a lot of attention to modifying mobile phones, like a real want to see a new launch or something like that. And new f television products coming up, but nobody giving uh much idea to this. Like Sarah was telling, everything's Right. Mm-hmm. Maybe fifty percent more. Yeah. Who knows? Yeah. There's a final questionnaire. Celebration, you didn't talk about that. Yeah. If you leave them on the whole time you get to look like a noodle the whole time. Is that. three, apparently. Okay, you all switched on. I presume we're good to go. Okay, um minutes um we decided to use a kinetic charger, standard chip, um 'cause it can come in various different sizes, it wasn't uh uh gonna be a problem factor. We wanted a stand-by function. The case material is gonna be soft, rubbery, changeable. Um buttons with a combination of L\_C\_D\_ and rubber according to the design. Um bright funky designs inspired by fruit, keeping with the hip kind of feel. Um and to try and incorporate voice recognition software into our design until we can

find out more about the cost of things like that. Um and the rubber buttons that we'll use will be anti-R\_S\_I\_. O

kay? Prototype presentation. I think that would be you. Make sure the camera's Yes, yes you can. Wait a second, I'll get it out. Um Okay. You should have one of those things and you can just take it off. Ta-da. Right. Mm 'kay. Mm-hmm. Okay. Mm. So it's flush. Oh right, okay, yeah. So put it in the top section rather than the bottom sections, 'cause it's the top part that's okay. Okay. I'm under the sofa. Or, that would be too complicated. Infrared. Like here. Okay. Actually, no, it would be it would have to be on the on the front. Oh right, yeah, okay, yeah, I've got you. It's still pointing, yes. Yeah, that would make sense. Okay. But not interfering with the outside kind of look of the product once it's Okay. Thank you very much. Wrapping it all up, okay. Um I've now got evaluation criteria. It's to be presented. Okay. It's quite similar to what it was before, though. Sorry. Mm-hmm. Okay. Just write small. Yeah. That works. Mm-hmm. I would agree. Okay. I would say two. A two. It's just two point five for that one. I would say a two. I would say a two. One point seven f five. Okay, mm-hmm. Mm-hmm. One. Well the type of button that we're gonna use in the bottom half, the material, minimises R\_S\_I\_ it's meant to. Um maybe because it's slightl with the size that we've got it's quite small, but with the amount of stuff we're putting on it isn't that much. So maybe because there's more space, it's not kind of moving around trying to hit accurately the buttons in between. It's quite obvious just big buttons. Um Four. A standard. It would be. And if you didn't hear it in the room that you were standing in, then you'd realise that it wasn't in that room, you'd go into another room. One. I don't think so. I think we yeah. I think we're set. Do much apart from having a huge big Don't think so. Okay, thank you. Okay, I've got finance here now. I'm gonna plug this in so you can all see it, if that's okay. Um. Thanks. Right. Now I presume that the screen will go blank, that um Okay. We just type numbers into this and we come out with the final value. So are we still on for kinetic? Okay. See, it woulda been handy to have this at the beginning. Um it might have influenced our choice. Right, what's happening with the electronics? Double-curved. Oh, right, okay. Thanks. So, would there be two? One chip. Okay. One double curve. So what's a single curve then? So just one double Yeah. Um Mm. Um we've got plastic and rubber, haven't we?. Um Do you think? Okay. It would be like saying we're using See, it says case material. So we're not actually using plastic in the case, are we? It's including, it's including. Okay, we'll just put it in as we'll put in as half. Or sh we should just put it in as one, because the plastic is zero anyway. No, we don't step on anyone's toes. Okay, special colour, do we need that? N yeah, okay. Interface. Buttons Has that not gone up? Oh no, it was seven five it's changed not a lot. Oh, it's not calculated it. Okay, there we go. It's not a lot though. We haven't been dealin we haven't been dealing with dollars though, I think Okay, so the highest we've got is the electronics here. Um and the interface. Where's the where's the voice recognition? Right, okay. Well the kinetic is three. If we change it to the battery it's that's minus three. Oh, right. I keep seeing zero. Um We can do it some other way, we can do it doesn't have to be voice recognition. We could do the voice recognition for, you know, business class or something, you know, like an upgraded version. You could choose to have that or not. So should we just change the design specification then? Yes. Mm-hmm. Mm-hmm. Okay, we can make the price fit, and then say if we'd had our budget, we would've had this, because it also sets it apart from the crowd. They like their gadgets, they like something that's completely different. It's s something completely different associated with your company. Right, okay, so It's two point five. No, it's twelve point two five.

Yeah well two, twelve point two five times two is twenty five, isn't it? I think the agenda one was where the um price was, wasn't it? No. Twelve point five. Well done, people. So is that uh got us covered for the electronics then? We don't need something else to take that place? Okay. Okay. Right, so we've

done that. Okay. Product evaluation. We've done room for creativity, haven't we? Because we've got decisions that we would have made that we weren't didn't feel able to make. Um I presume we discussed leadership and teamwork. um in the sense that um did you feel like a team? Or did you feel like uh autonomy? Mm-hmm. Thank you. How did you find it? Yeah. Yeah. I liked the fact that we could say an idea and it'd be suggested that that wasn't the best idea, but no one felt like shot down, you know, y it didn't matter it saying what you thought, because if it wasn't something that was that relevant, then it didn't matter, 'cause it was just another idea in the field. I like that. Um teamwork. Well you two created that wonderful specimen of a Play-Doh model. Um uh I'm still not caught up. But that's nothing to do with the teamwork at all. Um Maybe. No, that was quite fun. Um means, whiteboard, digital pens, etcetera, what does that mean? Any ideas? Had time to kind of Yeah, 'cause we could just sort of say, sorry what did you say about that or what do you think about that, rather than having to email it, yeah. But it was nice having it there. Um like the whole picture of the thing. Yeah, I think it's new ideas in general, rather than Mm. Yeah, no. Well they have to come from somewhere, don't they? And as sh as w sorry, you go. Um as was shown by your presentation with all of the other controls, remote controls, no one's thought about it particularly. I mean they're slightly different, so if someone's been shut in the room and said make ours a bit different from everyone else's, 'cause it's w something we should think about, but obviously no one's put any great deal of thought into it. Mm. But then when it everything is really smart, and you've just got this big chunk of black thing sitting on your coffee table, it doesn't go, I mean if you could have something that's a proper funky thing, a funky item that's individual, individual to you, I mean they could even go into um you go in with an idea and they design it on Photoshop and then they just get it printed on the plastic, you would pray you would pay a lot extra, because it's individually being a plastic was being made for you. But people could have anything that they wanted. Because of the produ Mm. Yes. Yeah. Well, it's innovation for money's sake. The the people have to keep buying. Yeah. And you can't get you've got your handset that works fine, but you can't get the battery anymore for that type of phone, because the phones have moved on, things like that. Yes. It's madness. Um In closing There we go. Um our costs are below budget with recommendations that they the budget be increased, but I think I don't know, d what do you think? Do you think that's takes into account um overheads like us being well paid kind of a thing? And the heating for the building, do you think our budget includes everything, all the costs that are going out? So it looks well it looks like it's gonna be fifty percent profit, you've still got all of the overheads to come out of that. So maybe increasing it, you would also have to increase the price that it's sold at. But I think but you were saying that that's quite Hmm. Yeah. Mm. Yeah. It's a shame it won't ever get made. Maybe it will. Maybe someone'll r run down and patent it. Um the project has been evaluated well and truly. Um and we've got the meeting survey and questionnaire. Oh, so we've got about fifty minutes to catch up with everything that I fell behind with, so I'll be delegating in my um role as Project Supervisor, so good luck. I think the celebration is the twenty five pounds. Either that or we'll be dancing on the desks. Oh. Um ye ah, just the last, I think. I think I've got minutes for two of the meeting and the last thingy. I just got con

Data Source: Train

## Executive Summary

The project manager introduced the upcoming project to the team members and then the team members participated in an exercise in which they drew their favorite animal and discussed what they liked about the animal. The project manager talked about the project finances and selling prices. The team then discussed various features to consider in making the remote.

## Complete Meeting Transcript

Hi, I'm David and I'm supposed to be an industrial designer. Um, I just got the project announcement about what the project is. Designing a remote control. That's about it, didn't get anything else. Did you get the same thing? Cool. There's too much gear. Okay. Can't draw. Um. Yeah. Um, well anyway, I don't know, it's just the first animal I can think off the top of my head. Um. Yes. Big reason is 'cause I'm allergic to most animals. Allergic to animal fur, so um fish was a natural choice. Um, yeah, and I kind of like whales. They come in and go eat everything in sight. And they're quite harmless and mild and interesting. Tail's a bit big, I think. It's an after dinner dog then. Hmm. It does make sense from maybe the design point of view 'cause you have more complicated characters like European languages, then you need more buttons. So, possibly. Hmm. Yeah. And you keep losing them. Finding them is really a pain, you know. I mean it's usually quite small, or when you want it right, it slipped behind the couch or it's kicked under the table. You know. Yep. Mm-hmm. I think one factor would be production cost. Because there's a cap there, so um depends on how much you can cram into that price. Um. I think that that's the main factor. Cool. Okay. Right. Um well this is the kick-off meeting for our our project. Um and um this is just what we're gonna be doing over the next twenty five minutes. Um so first of all, just to kind of make sure that we all know each other, I'm Laura and I'm the project manager. Do you want to introduce yourself again? Okay. Great. Okay. Um so we're designing a new remote control and um Oh I have to record who's here actually. So that's David, Andrew and Craig, isn't it? And you all arrived on time. Um yeah so des uh design a new remote control. Um, as you can see it's supposed to be original, trendy and user friendly. Um so that's kind of our our brief, as it were. Um and so there are three different stages to the design. Um I'm not really sure what what you guys have already received

um in your emails. What did you get? Mm-hmm. Is that what everybody got? Okay. Um. So we're gonna have like individual work and then a meeting about it. And repeat that process three times. Um and at this point we get try out the whiteboard over there. Um. So uh you get to draw your favourite animal and sum up your favourite characteristics of it. So who would like to go first? Very good. Mm-hmm. Yeah. Yeah. Right. Lovely. Right. You can take as long over this as you like, because we haven't got an awful lot to discuss. Ok oh we do we do. Don't feel like you're in a rush, anyway. Ach why not We might have to get you up again then. I don't know what mine is. I'm gonna have to think on the spot now. Is that a whale? Ah. Okay. God, I still don't know what I'm gonna write about. Um. I was gonna choose a dog as well. But I'll just draw a different kind of dog. M my favourite animal is my own dog at home. Um That doesn't really look like him, actually. He looks more like a pig, actually. Ah well. Do you? Oh that's very good of you. Uh. Um he's a mixture of uh various things. Um and what do I like about him, um That's just to suggest that his tail wags. Um he's very friendly and cheery and always pleased to see you, and very kind of affectionate and um uh and he's quite quite wee as well so you know he can doesn't take up too much space. Um and uh And he does a funny thing where he chases his tail as well, which is quite amusing, so It is. I think it is. He only does it after he's had his dinner and um he'll just all of a sudden just get up and start chasing his tail 'round the living room. Yeah, so uh Yeah, maybe. Maybe. Right, um where did you find this? Just down here? Yeah. Okay. Um what are we doing next? Uh um. Okay, uh we now need to discuss the project finance. Um so according to the brief um we're gonna be selling this remote control for twenty five Euro, um and we're aiming to make fifty million Euro. Um so we're gonna b

e selling this on an international scale. And uh we don't want it to cost any more than uh twelve fifty Euros, so fifty percent of the selling price. Sure. All together. Um I dunno. I imagine That's a good question. I imagine it probably is our sale actually because it's probably up to the the um the retailer to uh sell it for whatever price they want. Um. But I I don't know, I mean do you think the fact that it's going to be sold internationally will have a bearing on how we design it at all? Think it will? Um. Hmm. Oh yeah, regions and stuff, yeah. Yeah. Okay. Yeah. Well for a remote control, do you think that will be I suppose it's depends on how complicated our remote control is. Yeah, yeah. Okay. What, just like in terms of like the wealth of the country? Like how much money people have to spend on things like? Aye, I see what you mean, yeah. Marketing. Good marketing thoughts. Oh gosh, I should be writing all this down. Um. Mm. Yeah. Yeah, yeah. Like how much does, you know, a remote control cost. Well twenty five Euro, I mean that's um that's about like eighteen pounds or something, isn't it? Or no, is it as much as that? Sixteen seventeen eighteen pounds. Um, I dunno, I've never bought a remote control, so I don't know how how good a remote control that would get you. Um. But yeah, I suppose it has to look kind of cool and gimmicky. Um right, okay. Let me just scoot on ahead here. Okay. Um well d Does anybody have anything to add to uh to the finance issue at all? Thin No, actually. That would be useful, though, wouldn't it, if you knew like what your money would get you now. Mm-hmm. Yeah, yeah. Oh. Five minutes to end of meeting. Oh, okay. We're a bit behind. Yeah. Right, so do you think that should be like a main design aim of our remote control d you know, do your your satellite and your regular telly and your V\_C\_R\_ and everything? Mm-hmm. Yeah. Or even like, you know, notes about um what you wanna watch. Like you might put in there oh I want to watch such and such and look a Oh that's a good idea. So extra functionalities. Mm-hmm. Hmm. Um okay, uh I'd wel we're gonna have to wrap up pretty quickly in the next couple of minutes. Um I'll just check we've nothing else. Okay. Um so anything else anybody wants to add about what they don't like about remote controls they've used, what they would really like to be part of this new one at all? You keep losing them. Okay. Yeah. W You get those ones

where you can, if you like, whistle or make a really high pitched noise they beep. There I mean is that something we'd want to include, do you think? Dunno. Okay maybe. My goodness. Still feels quite primitive. Maybe like a touch screen or something? Okay. Uh-huh, okay. Well I guess that's up to our industrial designer. It looks better. Yeah. Okay. Okay. Right, well um so just to wrap up, the next meeting's gonna be in thirty minutes. So that's about um about ten to twelve by my watch. Um so inbetween now and then, um as the industrial designer, you're gonna be working on you know the actual working design of it so y you know what you're doing there. Um for user interface, technical functions, I guess that's you know like what we've been talking about, what it'll actually do. Um and uh marketing executive, you'll be just thinking about what it actually what, you know, what requirements it has to has to fulfil and you'll all get instructions emailed to you, I guess. Um. Yeah, so it's th the functional design stage is next, I guess. And uh and that's the end of the meeting. So I got that little message a lot sooner than I thought I would, so Mm-hmm. Uh-huh, yeah. Th Okay, well just very quickly 'cause this we're supposed to finish now. Um I guess that's up to us, I mean you probably want some kind of unique selling point of it, so um, you know Yeah. Mm-hmm. Yeah. Okay. Right, okay, we'll that's that's the end of the meeting, then. Um. So, uh thank you all for coming. Um I'm Craig and I'm User Interface. Yeah. Well, my favourite an

imal would be a monkey. Then they're small cute and furry, and uh when planet of the apes becomes real, I'm gonna be up there with them. Yeah. I know um My parents went out and bought um remote controls because um they got fed up of having four or five different remote controls for each things the house. So um for them it was just how many devices control. Uh. Mm-hmm. Great. And I'm Andrew and I'm uh our marketing expert. Mm-hmm. Mm-hmm. Yeah, that's that's it. Yeah. I will go. That's fine. Alright. So This one here, right? Okay. Very nice. Alright. My favourite animal is like A beagle. Um charac favourite characteristics of it? Is that right? Uh, right, well basically um high priority for any animal for me is that they be willing to take a lot of physical affection from their family. And, yeah that they have lots of personality and uh be fit and in robust good health. So this is blue. Blue beagle. My family's beagle. I coulda told you a whole lot more about beagles. Boy, let me tell you. Impressionist. Alright. Mm. Superb sketch, by the way. Yep. I see a dog in there. Yep. Now I see a rooster. What kind is it? Is he aware that th it's his own cha tail he's chasing? Hmm. Probably when he was little he got lots of attention for doing it and has forever been conditioned. 'Kay. Um, can we just go over that again? Uh, so bas at twel Alright, yeah. Okay. So cost like production cost is twelve fifty, but selling price is is that wholesale or retail? Like on the shelf. Our sale our sale anyway. Yeah, okay okay. Okay. Mm-hmm. Alright. Yes. Mm-hmm. Mm-hmm. Well right away I'm wondering if there's um th th uh, like with D\_V\_D\_ players, if there are zones. Um f frequencies or something um as well as uh characters, um different uh keypad styles and s symbols. Um. I don't know. Yeah. Yeah. Yeah. And then a and then al the other thing international is on top of the price. I'm thinking the price might might appeal to a certain market in one region, whereas in another it'll be different, so Just a chara just a characteristic of the Just Or just like, basic product podi positioning, the twenty five Euro remote control might be a big hit in London, might not be such a big hit in Greece, who knows, something like that, yeah. Yep. Right away I'm making some kind of assumptions about what what information we're given here, thinking, 'kay trendy probably means something other than just basic, something other than just standard. Um so I'm wondering right away, is selling twenty five Euros, is that sort of the thi is this gonna to be like the premium product kinda thing or Uh-huh. Mm-hmm. Yep. Yeah, I'd say so, yeah. No. Yeah, yeah. Mm-hmm. Do we have any other background information on like how that compares to other other Yeah. Mm-hmm. Yeah, interesting thing about discussing um production of a remote control for me is

that I as you point out, I just don't think of remote controls as somethin something people consciously assess in their purchasing habits. It's just like getting shoelaces with shoes or something. It just comes along. Do you know what I mean? Like so sort of like how do you I I mean one one way of looking at it would be, well the people producing television sets, maybe they have to buy remote controls. Or another way is maybe people who have T\_V\_ sets are really fed up with their remote control and they really want a better one or something. But Right. Right. Okay so Right, so in function one of the priorities might be to combine as many uses I think so. Yeah, yeah. Yeah. Well like um, maybe what we could use is a sort of like a example of a successful other piece technology is palm palm pilots. They're gone from being just like little sort of scribble boards to cameras, M\_P\_ three players, telephones, everything, agenda. So, like, I wonder if we might add something new to the to the remote control market, such as the lighting in your house, or um Yeah, yeah. An Yeah. Like, p personally for me, at home I've I've combined the um the a

udio video of my television set and my D\_V\_D\_ player and my C\_D\_ player. So they w all work actually function together but I have different remote controls for each of them. So it's sort of ironic that that then they're in there um you know, the sound and everything it's just one system. But each one's got its own little part. Mm. Mm. Mm. Mm-hmm. Mm-hmm. Yeah. Yeah. That's just really good id Yep. Uh, sure. I remember when the first remote control my my family had was on a cable. Actually had a cable between it and the T\_V\_ and big like buttons that sort of like, like on a blender or something. And um, you know, when I think about what they are now, it's better, but actually it's still kind of, I dunno, like a massive junky thing on the table. Maybe we could think about how, could be more, you know, streamlined. S Something like that, yeah. Or whatever would be technologically reasonable. 'Cause it could b it could it could be that f it could be that functionally that doesn't make it any better, but that just the appeal of of not having You know, these days there's a r pe things in people's homes are becoming more and more like chic, you know. Um, nicer materials and might be be worth exploring anyway. Okay. Um. Before we wrap up, just to make sure we're all on the same page here, um, do we We were given sort of an example of a coffee machine or something, right? Well, um are we at ma right now on the assumption that our television remote control may have features which go beyond the television? Or are we keeping sort of like a a design commitment to television features? I I don't know. Yep. Yeah, sure. Okay. Okay, yeah. Okay. Okay. Okay. Alright.

Data Source: Train

## Executive Summary

So we are here for the functional design meeting mm I will take notes during this meeting so I will try to summarise it and put that summary in the shared folder if you want to look at it afterwards so then uh each of you will uh lead a presentation on the task that has been required last time We have a technical problem uh . Otherwise , could you just describe by hand ? With the the whiteboard ? So um the question well first of all what to control . So most people want to have a a remote for their hi-fi and T\_V\_ and stuff like that . and other people also want to have remotes for controlling um whole house . so there's a project I think called X\_ house or something like that that does that , uh you can integrate your remote with uh computers stuff . the finder feature yeah by whistling or whatever . Uh if you have the finder feature then you can also have uh at the same time as and general voice commands if you want yeah . so the user interface will consist of two parts . Uh and th the buttons part would be uh a set of buttons for choosing devices , a set of buttons for special navigation in space , a set of buttons for linear access of medium and a set of buttons for random access . What do you mean by linear access then ? Like a video tape goes forward , backwards , uh fast and stuff yeah . For special navigation for example you might have a T\_V\_ in the menu and you going to change yeah ? and also parameter changing . So if there are common parameters maybe we should put special buttons for that um or maybe we could have everything uh generic Voice command w we could specify anything . We could assign any button a command to any button , if we have enough processing power , Um I dunno if you can open the Short-cut to AMI shared folder ? Maybe you can send it to me by email . I will try to show it to everyone , in our usability lab we observed the remote control use among one hundred subjects and the subjects also filled a questionnaire so you can see that um seventy five per cent of users find most remote controls ugly Eighty per cents of users would spend more money when the remote control would look fancy . seventy five per cent of users say they s zap a lot . Uh the buttons have are to be um uh uh like you say resist resisting to to shocks . Um and fifty per cents of users say they only use uh ten per cents of but of the buttons in the in the remote control . F not many buttons , and uh and uh uh u useable buttons . but in fact we it it seems that we are going to make a T\_V\_ remote control according to new requirements I received from the management so they said uh they lost uh often the remote control in in the room so they want to have a way to to lot of the time they it takes too much time to learn how to use a new remote control . So they want something s really very simple

and uh easy to use . And uh remote controls are bad for R\_S\_I\_ so you we have to make it uh more ergonomic yeah . We know that uh the user use uh a lot their um remote control um to to change channel . Um and um to to change uh volume selection of the for the younger it's very important To have L\_C\_D\_ and voice . and speech recognition . And uh and the others is not so important So as we say before , I think uh um a remote control lightening in the dark it's it's a good thing . Because I received that email from management board and they seems to tell that that if we want to be on the market as early as possible we should uh focus on T\_V\_ more where it seems that the market is more important . but I think we have some technical problem or so . So I'm just going to describe briefly what we do in the remote control . Basically we have a a battery a power supply here . After that we just have um user interface . which could be um a L\_C\_D\_ let's say or um an array of push button , something like that . Push button or a L\_C\_D\_ . After that we we feed that into um uh an electronic chip . So I say U\_C\_ and I feed that to uh L\_E\_D\_ which is uh infrared um which is a an infrared um component . Um we just have to define the processing power that we need uh standard uh standard remote control takes maybe uh one month to to do that . So the only time problem is the sp voice recognition . I would say uh about eight months to have the first results . How much will it cost for one hundred thousand ? Usually this is less tha at two dollars per chip . and what about if we design a remote control which can be configure as you want ? another thing is that if we make something that's simple and easy to use that's bas to use immediately that means that it will be exactly the same as everything else . so maybe if we design something very simple and easy to uh find when lost it will uh add uh a serious competitive advantage so we don't have to make a very complex remote controls to access teletext and stuff like that So anyway we don't have to include this feature because it's it's not used any more by users , And then also we have to make very uh uh clear that this uh this remote control is is part of of our products and show our corporate uh logo and and colours on the on the design as well so that uh they identify it as one of our product . So before uh finishing we can uh define uh what would be the characteristic of the o th of the control of the remote control so from from the the Marketing Expert I think a key aspect is the easy to use aspect , So few buttons , channel , volume control Maybe switch T\_V\_ on and off I discovered that when I did a quick look , uh they do now som they do something which is quite nice now , you have a button , you you press it , and this is uh the previous channel which has come back . Maybe we can include that also . Previous previous channel button . How should they how should we implement that ? Because uh could be numerical only or could be also incremental . This is uh incremental , but once you press it for a long time , you go five by five . Because you have your previous channel button if you have incremental only it's not uh it isn't worth it because the previous channel is eith either minus one or plus one . I mean you know there is are some with a wheel like this . Instead of having the up down buttons for uh you can have the wheel . So have a wheel for incremental , have the digits uh on the lower side that can be closed I would say the wheel is better . not a a wheel but a ball , so it should be lightening in the dark I think because most people lost their remote control . and do we put an L\_C\_D\_ display ? If you do not multi function then there is no p point in having L\_C\_D\_ . Just increase the cost . So no L\_C\_D\_ ? And so no speech as well because it w it would delay too much the development process Yeah . That would be cool . But eight months is really long so I we will move to next meeting so in after the lunch break and I I will make a summary of that meeting that I will put in the shared folder you can't see Uh maybe for next meeting uh send me your presentation before by email so that we can see

them uh altogether .

## Complete Meeting Transcript

Mm. Yeah. Um I dunno if you can open the uh m is not here. Uh in yeah okay. No. In document. Mm computer yeah. Here. Here. But it's not Um. Mm-hmm. Yeah, I can do that. Okay. Um. It's participant one? Okay. You can uh. Yeah. Okay so you can you can go. Okay so in our usability lab we observed the remote control use among one hundred subjects and the subjects also filled a questionnaire okay? And here I have the results so you can see that um seventy five per cent of users find most remote controls ugly so we have to find something to make them more more nice, more kind. Eighty per cents of users would spend more money when the remote control would look fancy. Eighty hundred per cent of users would spend more money when the remote control would look oh to it's not good. So okay. So it's not in theory but I I can I can say yeah. Fifty f uh seventy five per cent of users say they s zap a lot. So mm we have to have a remote control uh very um out for that. Uh the buttons have are to be um uh uh like you say resist resisting to to shocks. Um and fifty per cents of users say they only use uh ten per cents of but of the buttons in the in the remote control. So all the buttons we we have to put are have to to have um a use a real use and not only or Yeah. F not many buttons, and uh and uh uh u useable buttons. Sorry? Yeah. Uh most for most is T\_V\_. 'Kay you can go so. So there are other frustrations expressed by users, so they said uh they lost uh often the remote control in in the room so they want to have a way to to find it. Um and um lot of the time they it takes too much time to learn how to use a new remote control. So they want something s really very simple and uh easy to use. And uh remote controls are bad for R\_S\_I\_ um I dunno. Yeah. Uh. Okay um before that I I have some some some thing uh to say before um We know that uh the user use uh a lot their um remote control um to to change channel. Um and um to to change uh volume selection of the and uh and not uh a lot for setting for setting the the channels and uh thing things like that. So it's better to put uh uh uh something very easy to set and uh and Very accessible yes. That's right. So then we asked some questions to them and um we asked this question if they prefer an L\_C\_D\_ screen or on their remultific function remotes control and if they mm pay more for speech recognition in remote control and you can go we have here the results of of the questions. So you know that um for the younger it's very important to have the s yes and speech recognition. And uh and the others is not so important but uh we know that uh uh people between fifteen and twenty five are people who watch a lot T\_V\_ and uh who who wh can use a lot this uh. So maybe we we can have a speech recognition in. Yeah. Mm. Okay and if there is th the conclusion now. So as we say before, I think uh um a remote control lightening in the dark it's it's a good thing. Uh not to many mud buttons like we we said before, e easy to use uh a way to find it easily in the room and uh uh resistant to to shock and to to An I s no, yeah. I dunno if you see something else important or Mm. Yeah. Mm. Mm. Mm? Yeah. Oh. Would j Uh yeah w I I think they they say that it's uh difficult to learn how to use it but i when you know how to use it, it's it's okay. But Yeah. Mm. Mm. Mm. Mm. Mm. Mm. Mm. Mm-hmm. Hmm. Mm-hmm. Mm. No. No no. I dunno, I dunno it. 'Kay thank you. Okay everyone's ready. So we are here for uh for uh functional design. Okay? So we are here for the functional design meeting mm so first I will show the agenda so we will uh I will take notes during this meeting so I will try to summarise it and put that summary in the shared folder if you want to look at it afterwards so then uh each of you will uh lead a presentation on the task that has been required last

time so user requirement specification, technical function design and working design. Then I will uh present you some new project requirements I received from

uh the management board. Then we will take uh the decision on on the remote control uh needed functions and then I will assign you the task for the next part of the meeting. Of the of the process. So uh who want to start the the presentation of what they did? You can start. You have uh PowerPoint? Ah yeah maybe there. Okay. Who are you? Ouch. And We have a technical problem uh. You put it on Yeah. You have no Over. Okay. There's no We have a technical problem. If you remember yeah but that's Yeah. Yeah. Okay. Okay so special navigation, linear access, random access and there's a fourth one no? So the better now for special navigation? Okay. Then linear access then random access. Ah yeah parameter okay. Okay. Okay. Okay and and voice command did you uh Okay. Okay. Okay. So that's uh that close your investigations? Okay. Okay. Maybe we can have a look at the user requirements with I dunno if I can open it. Maybe you can s It's Messenger no? In which folder? Short-cut to AMI shared folder? Maybe you can send it to me by email. Just to participant one. At AMI. I will try to show it to everyone, that would be more comfortable. You send it? Yeah. Uh this is this email. Okay. So maybe I can switch slides when you whenever you ask, that will be more convenient. So okay, functional requirements. Mm. Yeah. We can just keep doing that? Yeah. Okay. Okay. Okay. Okay, so fewer buttons maybe would be good? Okay. Yeah. Yeah but in fact we it it seems that we are going to make a T\_V\_ remote control according to new requirements I received from the management bo I will present them in the following. Okay. Yeah. To find it. Yeah. Yeah. Okay. What is her other side? Oh yeah? I did not knew that. Okay so you we have to make it uh more ergonomic yeah. It's your job Oh. Uh sorry got a message from Microsoft. Yeah. Yeah yeah. Yeah. Okay. Yeah. Okay. Yeah. This function should be very uh accessible. Yeah, okay. This is the main function okay. Yeah. Yeah. Yeah. To have L\_C\_D\_ and voice. Okay. Yeah maybe this this is important. Moreover th maybe those uh like those teenager customer could advice their parents to buy this equipment and so we can we have to take care of that point of view I think or so. Yeah. Okay. Yeah. Okay. Okay these are the user requi Yeah. No no no. We w it seems that we no want to have a T\_V\_ remote control. From the management board I receive an email. Cos it would be costly uh and and also it it would take more time to develop to have a a general generic remote control. That it would be too long to develop. Oh yeah. Because I received that email from management board and they seems to tell that that if we want to be on the market as early as possible we should uh focus on T\_V\_ more where it seems that the market is more important. So maybe it's a good decision. I dunno. What's your opinion? Okay. Maybe you can go to the whiteboard if you have some drawings to do I don't know. Okay. Are you okay? U\_C\_ is the central unit? Okay yeah. Computation. Okay. Okay. Okay so this is quite easy. There is not that much constraints. To have a you s you speak about with voi voice control? Standard button one. So do you have any idea of how long it would take to have voice recognition now? Okay so i it's a bit long yeah. One month for the standard one with button. Even if we have a L\_C\_D\_ display? Okay yeah. Okay so we can take this into account. So who think it would be good to go for uh like speech recognition? Yeah it will. Euros. Yeah, yeah. Well each unit is is sell uh twenty five Euros. Because we are It seems that that we want to sell like four million units from the first meeting. Okay. Maybe we can uh we can look at the new requirement I receive from the management board and discus discuss all function we want to have. Yeah I I will continue. Well ask your question if you want. Okay. It's not intuitive first. Yeah. But, but also it seems that Yeah. Yeah. Yeah. Maybe it would be more complex to configure it to be simple than creating a s

imple product. Yeah. But also we we see that that most people find it find remote controls too complex because they have too many buttons and they mainly use only channels and volume buttons. So we may just uh make a very easy to use remote control with mainly those buttons and maybe also um some lightning stuff too because most people find also hard to to find the remote control. Losed lose it etcetera. These these are these two points are the main frustrations so maybe if we design something very simple and easy to uh find when lost it will uh add uh a serious competitive advantage without making something too complex and too long to develop. So but le let us see first the new requirement. So we don't have to so this this uh is uh is um in the this is in the same direction as we were speaking so we don't have to make a very complex remote controls to access teletext and stuff like that Yeah but then you have to you have to define the buttons to surf amongst pages and stuff. Yeah. So well Yeah. So anyway we don't have to include this feature because it's it's not used any more by users, they prefer to s Yeah. I dunno. If i one button is still one more button. If if we want to make it very simple we have to reduce number of buttons compared to th to our competitors. Well anyway I have this point. We can discuss. Also um so as as I told before uh it would be better if it's only for the T\_V\_ um because we want to be quick on on the market. And then also we have to make very uh uh clear that this uh this remote control is is part of of our products and show our corporate uh logo and and colours on the on the design as well so that uh they identify it as one of our product. So this is the the key point. So before uh finishing we can uh define uh what would be the characteristic of the o th of the control of the remote control and which button do we need which function do we want etcetera. So do you um so so from from the the Marketing Expert I think a key aspect is the easy to use aspect, it should be very simple and most button are never used only ten per cent of the button are are used often so I think we have to do something very simple and I think we all agree on that point, no? Yeah okay. So yeah the key point here is simple. Maybe. So few buttons, channel, volume control and what el what function do you see in addition to that? Yeah. Maybe switch T\_V\_ on and off Yeah. Yeah. Volume, maybe a mute button, and then on off button. And that's all? Mm. Okay. Yeah this is cool. Maybe we can include that also. Previous previous channel button. So we have like channel button, the previous channel button, the volume button, plus a mute button, and uh just the the traditional on off button. Yeah. I I talk about that, yeah? Yeah. Incremental definitely because zapping you you switch them. We go faster? Mm. Maybe we should have also a digit button Yeah. Maybe we have also to have digits or only incremental. I dunno bec because if you have the Uh. Yeah. Because you have your previous channel button if you have incremental only it's not uh it isn't worth it because the previous channel is eith either minus one or plus one. So I think we need also digits. Maybe we we can make very obvious the channel and volume button button and smaller button down there with the the digits. Yeah. Yeah. Yeah. Yeah. Maybe we can have a wheel for incremental. Okay. So have a wheel for incremental, have the digits uh on the lower side that can be closed so as you say protected, and uh yeah I think this is the basi And do we do we have a No, a wheel is better. I would say the wheel is better. What is the expert of uh Okay. Yeah. That's a good idea. Well also we have to decide uh so it should be lightening in the dark I think because most people lost their remote control. Okay. Yeah, and do we put an L\_C\_D\_ display? Because it was important for young customers if you remember. Okay. So no L\_C\_D\_? And so no speech as well because it w it would delay too much th

e development process. Yeah. That would be cool. But eight months is really long and Maybe we can just uh Okay. So um I I will uh I will so I we will move to next meeting so in after the lunch break uh here are the individual uh action uh you are required to do but you will be uh recalled to the actions by uh email I think but you can take notes if you if you want but well the instruction will be sent. So thank you

for uh your suggestion and I I will make a summary of that meeting that I will put in the shared folder you can't see and uh and then you will um you will be able to to see what has been uh has been said on on this meeting and and what has been decided. Uh maybe for next meeting uh send me your presentation before by email so that we can see them uh altogether. That would be easier. No it did not work. She send it to me by email. So maybe this is better, to send it by email. Okay? So yeah I I'm it's in the first uh email so I'm participant one at AMI uh where is that, it's here. Participant one at AMI. Okay. So see you after lunch break. Hello. Make a start yeah. So. Cable, camera. Should be in my in their folder no? Up. Um at three I think. No? Mm. Do we think w s in the in the wrong folder maybe? It is possible. It was somewhere in something like this. I don't remember the name actually must be something like messenger AMI or something. Go up. Yeah go up. Again. No. Go back. Uh maybe messenger AMI. Messenger. No. There is nothing. Let's go and check. I'll go and check. Okay. Yeah. Yeah. So uh. Basically what we want here is a remote control right. So um the question well first of all what to control. So most people want to have a a remote for their hi-fi and T\_V\_ and stuff like that. And but other people want th also remotes for controlling uh and toys like robotic pets and little robots and stuff and other people also want to have remotes for controlling um whole house. Yeah, so there's a project I think called X\_ house or something like that that does that, uh you can integrate your remote with uh computers stuff. So there is one that is one thing. The other is the the finder feature yeah by whistling or whatever. Uh if you have the finder feature then you can also have uh at the same time as and general voice commands if you want yeah. So I think it should be a package in that case. Uh so the user interface will consist of two parts. One is the voice command part and on one is the actual buttons part. Uh and th the buttons part would be uh a set of buttons for choosing devices, a set of buttons for special navigation in space, a set of buttons for linear access of medium and a set of buttons for random access. Yeah? Like a video tape goes forward, backwards, uh fast and stuff yeah. Um. Mm? Yeah. For special navigation for example you might have a T\_V\_ in the menu and you going to change yeah? Uh. Mm. Yeah and also parameter changing. So if there are common parameters maybe we should put special buttons for that um or maybe we could have everything uh generic but uh there are a lot of uh remotes on the market right now and basically this is most of the almost everybody has this stuff. Voice command w we could specify anything. We could assign any button a command to any button, if we have enough processing power, I guess so. Yeah. Yeah. Yeah. Uh yeah I think so. Not so far. Where did you put it? mm. I'm designing the user interface. But what kind of remote controls did you look at? What kind of task was it? It was a T\_V\_? Huh. Uh-huh. Ah! Good. Other side yeah, yo wa your wrist. It i can become painful you can have tendonditis. Yeah. If you also up on a computer in a strange position. Ergonomic. But uh. Have to say ha ha. Mm-hmm. The first question. Mm. Mm. Mm I it's not true I think. The the second claim that you put. Yeah. I think that should be the same. I have uh I've no idea I mean I should know a bit more about how fast we can uh design it. I don't think Uh yeah. Yeah. Okay. Yeah. Yeah. Like a you feel a b

it like a dog with this stuff. This will think this will take more time to develop also. Yeah. Soon. Yeah. So the only time problem is the sp voice recognition. Yeah. Yeah. Ten years. But we don't have time to market. I think we should contact management. Well. Uh How muc how much do you get how much do you if you buy one million units h no, one hundred thousand units. Eh chips. We're gonna need chips right. Yeah. How much will it cost for one hundred thousand? Okay. So you have any idea for a powerful one that has uh good enough for do speech recognition. Yeah? Okay. So. No it doesn't. Okay. Four million. Mh-hmm. A a lot of people are uh if you have the L\_C\_D\_ screen if you can do it completely the way you want because the buttons also look the way you want them but it will be hard to

configure I mean imagine i uh so it's really something for the expert user. So I mean there are markets and markets. I think the young people are th uh are uh Christine here said uh you have a uh it is yeah. So for our young people uh it will be cool, they can be able to use it. Th maybe their parents will not but they will configure it. I guess. I don't know if there is study about that. Mm. And there are another thing is that if we make something that's simple and easy to use that's bas to use immediately that means that it will be exactly the same as everything else. All right? Otherwise, if it's different then of course everybody has somebody has to learn to use it first. Mm-hmm. Yeah. Mm-hmm. Mm-hmm. But teletext is just one button. You you just write the write the numbers. So will you add with the channel keys, right? So. I am. I'm sure that uh it don't like but uh I don't see just one button. So. Mm-hmm. Capital. Well if it is going to be just a T\_V\_ remote control it is going to be very simple. Well if it's going to be as simple as possible then just have the remote control, there is no other function that I can see really. Uh no you want to keep television on so that the advertising can revenue can come back to us. Or something. It's a memory, yeah. And uh and of course the channel changing buttons. How should they how should we implement that? Because uh could be numerical only or could be also incremental. Mm-hmm. Mm. It's an interesting idea, that if you press it for a long time it does something else, in general. So if you you have your ten buttons for the for the numeric the numerical buttons and you have instead of having just one memory you have if you press them for a long time No. Doesn't work does it. Maybe we should have a complete keyboard and just type console commands. Change channel to eight. No. Well if it's useful like if if you want to change between three channels for example then you h you cannot you cannot cannot work with just memory being incremental. Yeah. Yeah. Yeah when you zap usually you will have to press the same button all the time and Yeah. Mm-hmm. Hey I just thought this thing there is a I mean you know there is are some with a wheel like this. Instead of having the up down buttons for uh you can have the wheel. Yeah. Yeah. Mm-hmm. On the lower side I think it you have to turn it. No? If we do that. Yeah. Because of that Because it's uh it's it's not like a volume which is smooth yeah? The channels change one by one. So you have to the user has to like to should feel the the the discrete sense a bit. Yeah. Yeah. Even if i L\_E\_D\_ uh or a if it's the L\_C\_D\_ feature uh whatever, yeah. Yeah. I think it's only put on if cou have multi function. If you do not multi function then there is no p point in having L\_C\_D\_. Just increase the cost. The user does not have an advantage really. Well if it's going to delay yeah but uh it will be cool. It would. Because a user could say C\_N\_N\_ for example and it would go C\_N\_N\_. Mm. Yeah. Yeah. What is the folder that you put yours in? And did it it did work? Ah yeah. Mm. Okay. Okay what is your email? At participant one. Okay. Well during lunch break actually. So next t

ime we should have a fight. How about uh management or something. Who happens to be your friend. Okay. F do you want to start? Okay. No. What do you have in short cut? Participant two. Yeah. Otherwise, could you just describe by hand? With the the whiteboard? Mm-hmm. Mm-hmm. Mm-hmm. Mm-hmm. Okay. Mm-hmm. Mm-hmm. Mm-hmm. What do you mean by linear access then? Ah. Mm-hmm. Mm-hmm. Mm-hmm. I'm just thinking of some thing. Um We want to have a no, I don't know if this is a good idea. We want to have a a general remote control for everything. Okay. Yeah. Yeah. Yeah yeah. Yeah. No no. Finish tonight. But basically yeah maybe I can continue with my presentation, it would be al you you but I think we have some technical problem or so. So I'm just going to describe briefly what we do in the remote control. If fact Yeah but Do I have oh yeah. Now I have enough cables. Okay so I'm just going to describe in fact for for a remote control this is quite easy. We just have sorry, I'm going Like that. I'm just going to describe. Basically we have a a battery a power supply here. After that we just have um user interface. Let's say that um something like that, which could be um a L\_C\_D\_
